in spring 1992¹⁸ and expanded and revised several times²⁶ – focused on engineering and chemical aspects of the alleged ‘gas chambers’ at Auschwitz, and shall be summarized and supplemented in the following. The alleged ‘gas chambers’ of the Majdanek Concentration Camp, which were also a subject of the Leuchter Report, were briefly discussed in the 1994, first German edition of this contribution, but that topic is covered in the present edition much more expertly by a contribution by Carlo Mattogno following this one. I will dispense with an account of the ongoing debate about the interpretation of the documents found to date with respect to the issue of ‘gas chambers’ in Auschwitz, and, at least as interesting, with many other topics of this and related camps; serious readers are referred to the relevant literature.²⁹

2. Design of the Fumigation Facilities in Auschwitz

2.1. The Auschwitz Camp Complex

According to Pressac,¹⁰ the facilities of Auschwitz I/Main Camp were originally part of a barracks under the Austro-Hungarian Dual Monarchy (later Poland) and were converted into a concentration camp after the war against Poland. After the start of the Russian Campaign, Auschwitz II/Birkenau was planned as a prisoner-of-war camp of the Waffen SS to accommodate Russian PoWs. Later it was increasingly used to house Jews, who were deported there from all German-occupied or -controlled parts of Europe. The arrival of great numbers of people caused severe health-related problems in all camps. For this reason, all camps had extensive disinfection and delousing facilities. Since the end of the First World War, the general fumigant of choice for pest control (lice, bedbugs, fleas, beetles etc.) had been the product Zyklon B (hydrogen cyanide adsorbed onto diatomaceous earth or gypsum). In Camp Sections Ia/b of Birkenau, Buildings 5a and 5b each had a wing where one room was reserved for the delousing of material objects with hydrogen cyanide. These buildings are completely intact still today.

Orthodox historiography today assumes that the cremation facilities in Auschwitz and Birkenau served not only the purpose they had originally been intended for, namely the removal of victims of epidemics which occurred quite frequently despite intensive efforts at disinfestation. Later, it is claimed, these facilities were misused for the mass extermination of Jews. For this purpose, some rooms of the respective cremation facilities, after minor modifications, were allegedly used to kill people with Zyklon B (‘gassed’).

According to eyewitness testimony, there is said to have been at that time one ‘gas chamber’ in Crematorium I of the Main Camp, Auschwitz I. In Birkenau (Auschwitz II), approximately 1.5 miles away, there are said to have been one ‘gas chamber’ each in both Crematoria II and III, and two or three each – depending on who we believe – in both Crematoria IV and V, plus several more chambers in two farm houses, located outside the camp itself and purportedly altered for gassing purposes.

The individual facilities are described and discussed in the following.

1: Vestibule; 2: laying-out room; 3: washroom; 4: morgue;
5: furnace room; 6: coke; 7: urns

2.2. Delousing Chambers for Material Objects

Rooms where material objects were deloused with Zyklon B still exist intact today in the west and east wings of Buildings 5a and 5b of Camp Sectors BIa and b, respectively. The original German building plans identify these rooms as “Gaskammer” (gas chamber),³⁰ the term commonly used in those days for disinfestation facilities using gas.³¹ These delousing rooms, equipped with airlocks, had two round openings approximately 20 inches in diameter in their ceiling gables, fitted with an air intake and an exhaust ventilator. The roof had three ventilation chimneys; three furnaces were installed in these rooms during the time they were in use.³² This set-up, with heating and ventilation, must have been considered the minimum requirement for a facility to be used as fumigation chamber for safely disinfesting material objects.

³⁰ Blueprints of Buildings 5a/b: J.-C. Pressac, *op. cit.* (note 10), pp. 55-58; photos of the exterior, pp. 59f.; in 1943, the facility in Building 5a was altered to serve as hot-air delousing facility; cf. G. Rudolf, *op. cit.* (note 26), pp. 85-90.

³¹ See, e.g., the title of a well know and widespread book of these times: F. Puntigam, H. Breymesser, E. Bernfus, *Blausäuregaskammern [sic!] zur Fleckfieberabwehr*, Sonderveröffentlichung des Reichsarbeitsblattes, Berlin 1943. Emphasis added by the author; J. Graf, C. 2.3. The 'Gas Chamber' of Auschwitz I/Main Camp

According to Pressac, no material or documental evidence of the "gas chamber" allegedly installed in the crematorium of the Main Camp exists, but there are many witness accounts.³³ These accounts, according to Pressac, are characterized by many contradictions, technical impossibilities, and general incredibility. He observes a "general tendency to exaggerate."³⁴ In his second book, Pressac suggests that this homicidal 'gas chamber' was in operation only from January to April 1942, and he calls eyewitness statements alleging a longer time of operation "exaggerations."³⁵

In considering this crematorium, I will focus on the Zyklon-B-insertion openings and the ventilation holes of the homicidal 'gas chamber.'³⁶ Illustration 1 shows the floor plan of the building in 1942, originally designed to serve as a normal crematorium with a morgue.³⁷ The morgue is said to have been altered to serve as 'gas chamber' in late 1941 or early 1942. For the purpose of introducing Zyklon B into the room to effect the gassing of the victims, three or four holes are also said to have been cut into the roof later on, as well as one or two more to accommodate powerful ventilators,³⁸ although the latter claim is backed up by no evi-

³⁷ J.-C. Pressac, *op. cit.* (note 10), pp. 151, 153.

³⁸ *Ibid.*, pp. 131f., although witnesses have mentioned other numbers, if any (1, 2 or 6); see C. Mattogno,

dence whatsoever. In autumn of 1944, the crematorium was converted to an air-raid shelter for the SS.³⁹ The alleged Zyklon-B-introduction holes as well as the ventilation holes are said to have been sealed at that time.

Illustration 2 shows the floor plan of the crematorium as it exists today.⁴⁰ The input holes with wooden shafts visible today were installed in 1947 by the Polish Auschwitz Museum – according to Pressac not at their original location, but rather in a way that was considered more effective for tourist viewing purposes.⁴¹ According to the Auschwitz Museum, however, the new holes were cut in 1947 at the exact locations where the claimed original holes had been,⁴² although they admit that no evidence exists for the existence of any former holes⁴³ – except for the factually wrong testimony of a former museum guard.⁴⁴ This alteration and many others carried out by the communist post-war administration of the camp, which we can discuss here only briefly, are generally acknowledged as “falsifications” today.⁴⁵

It may at least be stated without fear of contradiction that the ceiling, exterior walls and pillars as well as the foundation of Crematorium I are in their original condition.

In addition to today's Zyklon-B-introduction shafts, there are indeed three locations in what is presented today as the “gas chamber” where the concrete has been breached in a circular pattern of some 35 cm in diameter, which indicates that these were once circular holes that were filled up. One of these holes is located in the area of the former washroom. A fourth former hole is located in the air lock. From their shape, their location, and their uneven distribution across the ceiling (marked 1 to 4 in Illustration 3) it results that these cannot have been former Zyklon-B-introduction holes. These were evidently holes for the ventilation ducts of the air-raid shelter, which are even mentioned in a document of August 26, 1944 regarding the conversion of this facility into an air-raid shelter.⁴⁶

The four openings in the concrete in existence today and presented as “Zyklon-B-introduction shafts” (marked A to D in Illustration 3) are neither filled, nor have the remnants of the severed steel reinforcement rods been removed in a workmanlike manner. The holes have been planked with wood and sealed with tar. Such poor workmanship reflects neither the care required in handling poison gas, nor standard German workmanship.

If the SS had put these holes in the concrete during the war, one must assume that they would have taken care to evenly distribute these holes in the ceiling of the original(!) morgue in order to ensure an even distribution of the Zyklon B inside the room. The shafts today, however, are only evenly distributed in the ceiling of this room if one considers the washing room, which was only incorporated after the war(!), as an integral part of the morgue (“gas chamber”; see Illustrations 1 and 2). The staggered arrangement of the whole makes sense

Auschwitz: Crematorium I and the Alleged Homicidal Gassings, 2nd ed., Castle Hill Publishers, Uckfield 2016, p. 95. The Auschwitz Museum has ordained that there were four of them.

[...] Tout y est faux” [Another delicate subject: what to do with the falsifications left behind by the communist administration? ... Everything there [at Crematorium I] is false.], “Auschwitz: La Mémoire du Mal,” *L'Express*, Jan. 19/25, 1995; Robert van Pelt, Deborah Dwork, *Auschwitz: 1270 to the Present*, Yale University Press, New Haven and London 1996, pp. 363f.; cf. also Carlo Mattogno's review “Architektonische Stümpereien zweier Plagiatoren,” *VffG*, 4(1) (2000), pp. 25-33; English: “Auschwitz 1270 to the Present: Critical Notes,” 1999 (<http://vho.org/GB/c/CM/irving-eng.html>).

⁴⁶ “Herstellung der für die Beheizungsöfen, sowie für die Ent- und Belüftung erforderlichen Mauerdurchbrüche und Schläuche,” letter from the Auschwitz Air-Raid Warden, Aug. 26, 1944, *RGVA* 502-1-401; see also “Erläuterungsbericht zum Ausbau des alten Krematoriums als Luftschutzbunker für SS-Revier mit einem Operationsraum im K.L. Auschwitz O/S. BW 98M,” *RGVA* 502-2-147.

Illustration 3: Floor plan of the morgue (No. 4) of Crematorium I (situation in 1942, from Illustration 1) with surgery room (No. 2) and washing room (No. 3, with opening no. 4). A, B, C, D: location of current openings in the roof made after the war. 1, 2, 3, and 4: location of original openings of the air-raid shelter for ventilation and heating ducts, today closed.

only if the area of the air lock added in 1944 was not part of the original morgue. But that area *was* part of the morgue.

Thus, the arrangement of today's introduction holes makes sense only if they were created especially for their present status as a falsely dimensioned "reconstruction for museum purposes" *after* the war.⁴⁷ The holes' locations were moreover chosen with precision in order that pairs are equidistant to the nearest transverse wall, leading to all four holes being somewhat evenly distributed over this room *in its current state*. This is the decisive evidence that these holes were created with regard to the measurements of the accidentally enlarged morgue/"gas chamber," and have nothing to do with the original morgue.

Based on all these arguments, it can be concluded with certainty that at the time of the alleged use of this room as a "gas chamber," there were no openings for the introduction of Zyklon B.

Furthermore, there was no direct access to the "gas chamber" from the outside. The victims would have had to enter through the corpse room (laying-out room), or through the furnace room. They would, therefore, have had to file past the corpses of their already-murdered companions in misery – truly a macabre spectacle. There could be no successful deception of the victims and camouflage, nor could there be any hope of willing co-operation or acquiescence on the part of the inmates under such circumstances.

Another remarkable feature of the room under consideration results from German wartime blueprints of 1940, 1942 and 1944: The door between the morgue and the furnace room was a swing door swinging both ways.⁴⁸ Such a swing door makes perfect sense when moving heavy loads through that door (e.g. corpses). Yet it is physically impossible to make such a door gas-tight and to lock up behind it a crowd of hundreds of panicking people.

The lack of a direct access to the "gas chamber" as well as the evident unsuitability, for a homicidal gas chamber, of the swing door between this room and the furnace room have been expressed by Robert Faurisson with the following words:

"No doors, no destruction."

⁴⁷ Brigitte Bailer-Galanda, *Informationen der Gesellschaft für politische Aufklärung*, Innsbruck, June 1991, No. 29, p. 1, regarding Leuchter's statements about Crematorium I: "2. He confuses museum reconstructions of the gas chamber, which are meant to give the observer an impression of the historical events, with real functioning gas chambers."

⁴⁸ Nov. 30, 1940: RGVA, 502-1-312, p. 135; April 10, 1942: RGVA, 502-2-146, p. 21; Sept. 21, 1944: 502-2-147, p. 20, although its orientation is inverted.

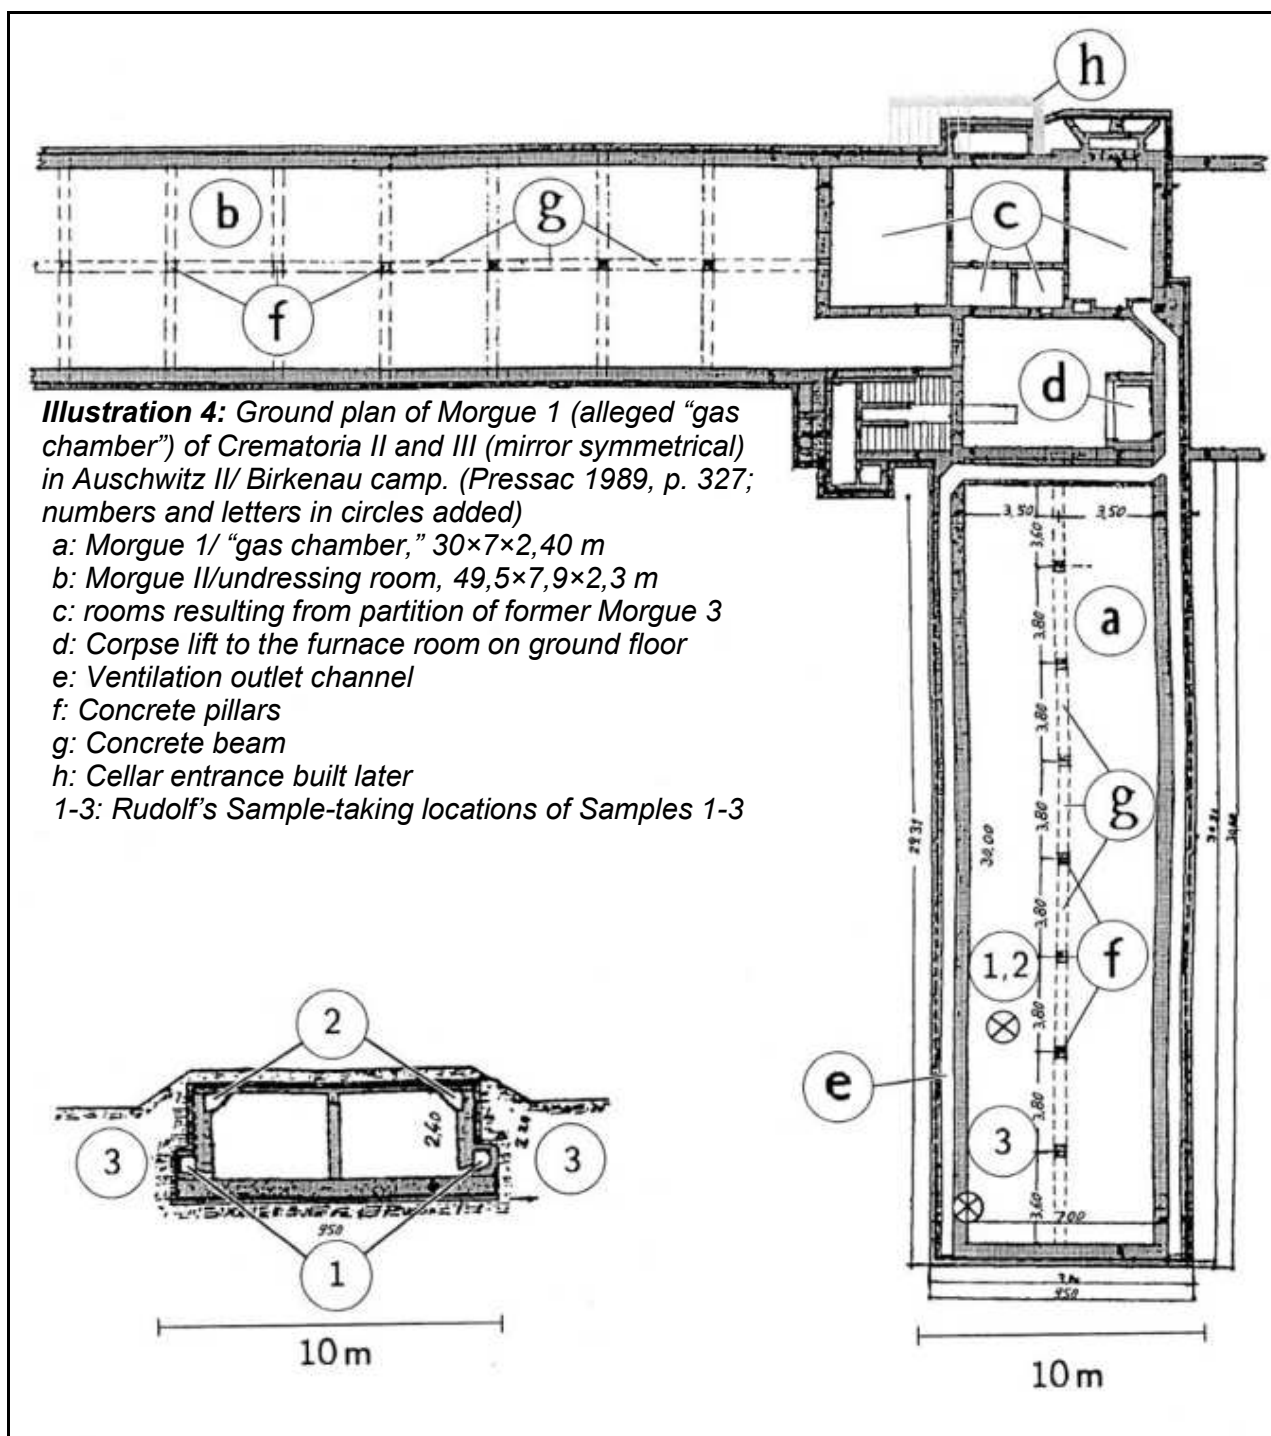

Illustration 5 (bottom left): Cross-section of Morgue #1 (alleged "gas chamber") of Crematoria II and III (mirror symmetrical) in Auschwitz II/Birkenau Camp (Pressac 1989, p. 329; numbers added). 1: ventilation outlet; 2: ventilation inlet; 3: soil

2.4. The 'Gas Chambers' of Auschwitz II/Birkenau

2.4.1. Crematoria II and III

In terms of size, fittings and construction, these crematoria are comparable with other civilian cremation facilities built in the Reich at that time, as well as with modern ones.⁴⁹ Details of the construction of Morgue 1, allegedly used as a homicidal 'gas chamber,' have already been discussed elsewhere.²⁹ I will again focus on the Zyklon-B-introduction shafts or holes in this basement room, which was equipped with ventilation but no heating devices.

⁴⁹ For a comparison, consider the construction of modern crematoria: H.-K. Boehlke, *Friedhofsbauten*, Callwey Verlag, Munich 1974, p. 117; E. Neufert, *Bauentwurfslehre*, Ullstein Fachverlag, Frankfurt 1962, pp. 423f.

Illustration 4 shows the floor plan of Morgue 1 (the ‘gas chamber’) of Crematorium II and also represents the mirror image of Morgue 1 of Crematorium III; Illustration 5 shows the cross-section.⁵⁰ According to eyewitnesses, there were also three or four openings in the ceiling here, through which the Zyklon B was introduced.⁵¹

Regarding the evidence provided by Allied air photos, the reader is referred to the chapter by J.C. Ball in the present volume. Clearly this information suggests that either there were no input shafts on the roofs, or that these were so small that they did not show up on the air photos, so that probably someone deemed it necessary to resort to photo retouching in order to falsify the air photos accordingly.

Today the roofs of Morgues 1 (the ‘gas chambers’) of both crematoria are broken and collapsed. There are no signs of shell impacts. It is assumed that these rooms were blasted.⁵² The ceiling of Morgue 1 (‘gas chamber’) of Crematorium II is still more or less intact and still rests partially on the concrete supporting pillars. Large parts of the walls and concrete ceiling still accessible in the interior of the cellar remain in their original state, protected from weathering. There are no visible signs of any erosion or corrosion.

In his first book, Pressac shows pictures of ventilation pipe openings in the roof of Morgue 2 of Crematorium II as well as in the concrete ceiling of the furnace room of Crematorium III.⁵³ Illustration 5 shows one of the five openings into the furnace room. In contrast to these cleanly cut holes, the only two holes to be found in the roof of Morgue 1 (‘gas chamber’) of Crematorium II, which Pressac claims to allegedly have been Zyklon-B-input holes, are clearly openings that were broken through the reinforced-concrete roof later (see Illustrations 7 and 8). Pressac and van Pelt concede that these are the only holes visible today.⁵⁴

Without exception the openings visible today in the roofs of Morgues 1 (‘gas chambers’) of Crematoria II and III are holes that were broken through the concrete after completion of the roofs. If any of these holes had served as Zyklon-B-input opening, then they would have to have been added after the roofs were completed. Since the roofs of these facilities were poured in the winter of 1942/43,⁵⁵ any additional openings could have been added to the roofs of both Crematoria in spring 1943 at the earliest. But the mass extermination in the facilities of Crematorium II is said to have been in full swing by then. This would imply an inconceivably stupid error in planning.

Also, given that such an opening, broken through the roof of one of the Morgues 1 (‘gas chambers’) after construction, would have caused considerable damage to the concrete and the iron reinforcement structure, it would have been inevitable for the ceiling breaks and cracks resulting from a subsequent blasting of the building to run primarily through these holes. The reason for this is that blasting represents an abnormal force, that material tension reaches very high peak levels around the corners of inserted openings (notch or fatigue effect), and that cracks proceed preferentially from weak points.⁵⁶

Therefore, particularly such openings whose belated addition has already damaged the structure of the surrounding concrete represent points where cracks and breaks are not only

⁵⁰ J.-C. Pressac, *op. cit.* (note 10), pp. 319-329. Building plans for Crematoria II and III.

⁵¹ For the most-graphic description, cf. the testimony of Schultze, engineer with the firm Topf & Söhne, in a KGB interrogation; cf. G. Fleming in *The New York Times*, July 18, 1993, p. E19; *Der Spiegel* 40/1993, p. 154.

⁵² Oddly enough, in the basement of Crematorium II, in the hallway leading to the Morgue, one finds a good number of gardening tools (shovels, spades etc.) partly covered by rubble. One would expect that in an orderly evacuation and subsequent demolition of the building the Germans would have taken these tools with them.

⁵³ J.-C. Pressac, *op. cit.* (note 10), pp. 365f.

⁵⁴ *Ibid.*, p. 354. It is significant that in his new book, *op. cit.* (note 20), Pressac simply ignores the problem of the Zyklon-B-insertion shafts and the indispensable, but missing, holes in the concrete ceiling. R.J. van Pelt, *The Pelt Report*, expert report introduced at the litigation trial of David Irving v. Penguin Books and Deborah E. Lipstadt, Queen’s Bench Division, Royal Courts of Justice, Strand, London, Ref. 1996 I. No. 1113, 1999; www.hdot.org/vanpelt_toc/, here p. 295.

⁵⁵ J.-C. Pressac, *op. cit.* (note 10), pp. 338f. In his new book, *op. cit.* (note 20), Pressac reproduces a large photo showing an outside view of the ceiling of Morgue 1 of Crematorium II, taken in winter 1943 (Document 27) – without any trace of an input hole!

⁵⁶ Cf. Heinz Neuber, *Kerbspannungslehre: Theorie der Spannungskonzentration*, 4th ed., Springer, Berlin 2001.

Illustration 6: Cleanly cut ventilation hole in the ceiling of the furnace room, opening into upper story. Note the damage caused by blasting.

Illustration 7: Alleged Zyklon-B-input opening in the roof of Morgue 1 ('gas chamber') of Crematorium II; entrance to part of the cellar still accessible today.

Illustration 8: Alleged Zyklon-B-input opening in the ceiling of Morgue 1 ('gas chamber') of Crematorium II. It is clearly visible that the reinforcing bars in the reinforced concrete were not even removed; they were merely bent back.

Illustration 9: Notch (fatigue) effect resulting at inserted openings from the application of force. The only crack running through the wall proceeds, naturally enough, from the corner of the window.⁵⁸

likely, but inevitable. This is demonstrated by Illustrations 6 and 9. Even though, in Illustration 6, the explosion pressure in the ground-level furnace room was able to escape in every direction, and the ceiling connecting to the upper floor remained almost fully intact, two of the five furnace-room air-vent holes, which had been neatly cast into the concrete ceiling and reinforced, were completely destroyed. Clearly visible cracks formed at the corners of two other holes.⁵⁷

Illustration 9 shows the consequences of a rockfall on a house wall with a window. The only crack in the wall proceeds from a corner of the window.

In the morgues of Crematoria II and III, the pressure from the explosion could only escape upward, which is why their ceilings were much-more-severely damaged than the ceiling of the furnace room or the wall of the house hit by a rockfall. The alleged Zyklon-B-insertion holes in the roof of Morgue 1 ('gas chamber') of Crematorium II, however, are conspicuous for their relatively undamaged condition; none of the many cracks and breaks in the ceiling runs through the hole shown in Illustration 8. An on-site examination reveals the random arrangement of this opening in a place where the morgue's ceiling is actually undamaged! What is more, at this opening, the reinforcement bars were only cut through once and then bent back. In 1991, when I visited the site, they were still at full length. Remnants of the reinforcement bars are also still visible at the edge of the hole in Illustration 7. No devices for the introduction of gas could ever have been securely installed, much less sealed to the outside, in such crudely cut and unfinished holes from which not even the reinforcement bars had been removed. Any attempt to do so would have endangered the entire vicinity, including the alleged perpetrators,

⁵⁷ Cf. the illustrations in G. Rudolf, *op. cit.* (note 26), p. 146.

Illustration 10: Photography of Crematorium II in Birkenau from the southwest, February 1943.

Illustration 11: Magnification of detail from Illustration 10 with outlines of the morgue and scale of measurements drawn in. The width of the three objects in Illustration 10 shows strong variation between ca. 50 and 75 cm. Furthermore, it is notable that the shady side of the first object, seen from the left, is considerably weaker than those of the others.

Illustration 12: Schematic drawing of a view onto Morgue #1 of Crematorium II. Longitudinal dotted line: the concrete longitudinal beam with the 7 supporting pillars. Drawn in as three intersecting lines: vanishing lines somewhere upon which the center of the three objects located on the roof must have been located. Obviously, they were not evenly distributed along the roof. Green (grey) shapes: actual location of the two openings in existence today.⁵⁹

⁵⁹ Taken from Jean-Marie Boisdefeu, *La controverse sur l'extermination des juifs par les allemands*, Vol. 1, V.H.O., Berchem 1994, p. 168.

with the poison gas that would have escaped in enormous quantities. What is more, only brute force could have stopped the supposed victims from escaping through these holes or even throwing the poison gas carrier out, since after all these holes could never have served as input devices – they were never finished.

One can therefore conclude with absolute certainty that the alleged input holes were not added until after the buildings had been blown up, *i.e.*, shortly before the German retreat. So, here as well the saying of Prof. Robert Faurisson goes: “No holes, no ‘Holocaust.’”⁶⁰

Thus, the objects shown in a photo reproduced by Pressac⁶¹ and Czech⁶² (cf. Illustration 10, enlarged in Illustration 11), must be interpreted differently. If these objects were indeed Zyklon-B shafts, as Pressac claims, they should be of equal size and equidistant, *i.e.*, evenly distributed on the roof of Morgue 1. But as shown in Illustration 11, the objects have different sizes. According to their shades, they probably have a rectangular shape, but not the same orientation. When evaluating their possible position on the roof by means of a perspective drawing, Illustration 12, it turns out that they are located closely together and are most-likely situated all together on one and the same half of the roof. If there had been holes under these objects going through the roof, then they should still be there today, but there are no traces of such holes in those locations. This is proof that these objects cannot have been Zyklon-B-introduction shafts. Maybe they are just some sort of building materials placed on the roof, since this crematorium was still under construction in February 1943.

Besides this, it should be noted that these objects are not visible on similar ground-level photos from Jan. 20, 1943,⁶³ and summer 1943.⁶⁴

2.4.2. Crematoria IV and V

Relating to these installations,⁶⁵ only a few documents as well as contradictory and, to some extent, incredible witness testimonies exist.⁶⁶ According to Pressac, the two western, heated, unidentified rooms, as well as the hallway connecting them with the rest of the building, served as ‘gas chambers.’ This assumption is based on the fact that these three rooms had little hatches in their exterior walls which had no glass panes and could be closed from the outside by wooden shutters. They are said to have been used to throw in Zyklon B.

There is no evidence for any ventilation facility for these rooms prior to May 1944. In Crematorium V, but not in Crematorium IV, a ventilation facility is said to have been installed starting in May 1944, when the extermination of the Hungarian Jews allegedly began.⁶⁷ Pressac shows a blueprint for this that he drew himself, but fails to cite a source for it. Fact is, however, that these three rooms, beside the coke room and the physician’s rooms, are the *only* ones in this building *not* having any ventilation chimney. Pressac himself points out that the lack of ventilation of the chambers would have resulted in the gas spreading through the entire rest of the building, so that all work would have had to cease for many hours.⁶⁸ He adds further that due to the technical inadequacies, the gassings in these rooms must have been a ludicrous procedure resembling a circus act.⁶⁹

In support of any criminal usage of these room, Pressac cites documents mentioning the “installation of gas-tight windows,” “pouring concrete floor in gas chamber,” and repeated references to gas-tight doors in various connections.⁷⁰ Mattogno has shown that the term “gas chamber” is always used in the singular in the few extant documents, and that documentary evidence points to the installation of showers in one of the two rooms in question.

⁶⁰ For a more thorough treatise of this issue see C. Mattogno, “The Elusive Holes of Death,” in: G. Rudolf, Carlo Mattogno, *Auschwitz Lies*, *op. cit.* (note 13), pp. 291-407.

⁶¹ J.-C. Pressac, *op. cit.* (note 10), p. 340, dated roughly Feb. 9-11, 1943.

⁶⁷ J.-C. Pressac, *op. cit.* (note 20), pp. 89f.

⁶⁸ *Ibid.* pp. 67, 89.

⁶⁹ J.-C. Pressac, *op. cit.* (note 10), p. 386.

⁷⁰ *Ibid.*, pp. 406, 442-455.

Both rooms in question had waste-water drains. Construction activities, which are referred to as “water installations” or “sanitary installations” in the documents, lasted from March 15 to April 23, 1943, and comprised a total of 816 man hours, hence were rather large construction projects. Mattogno posits that the large stoves installed in these rooms, which had to be fired from the hallway, served to both heat the shower rooms and provide hot water for the showers.⁷¹ The moisture in those shower rooms would also explain why the lamps were placed in recesses.⁷² This supports the thesis that these rooms served as hygienic centers. Mattogno also concludes from the extant documents that the hallway may have been temporarily considered to serve as a makeshift disinfestation gas chamber.⁷¹ A ventilation system would have been indispensable for this, however.

Mattogno has discovered that the hatches in the exterior walls of those rooms, which came in two sizes of only 15 cm × 25 cm or 20 cm × 30 cm when deducting the frames, had iron bars in front of them. This would have made it impossible to stick a can of Zyklon B through them, hence the introduction of the poison as attested to by witnesses was not possible.⁷³ These bars were even confirmed by the witness Henryk Tauber,⁷⁴ whom Pressac considers to be 95% reliable.⁷⁵

2.4.3. Farmhouses (‘Bunkers’) 1 and 2

The location and design of the converted farmhouses (‘bunkers’) and undressing barracks, allegedly situated west-northwest of the Birkenau Camp, are not precisely known.⁷⁶ Pressac describes the eyewitness testimony in this respect as contradictory.⁷⁷ The building called Bunker 2 is visible on air photos, whereas there is never any trace of Bunker 1.⁷⁸ Since the gassings attested to for these facilities resemble those for Crematoria IV and V (input chutes at the side, no ventilation, but no heating either), our remarks in Section 2.4.2. apply all the more strongly in this case. In his second book Pressac even goes one better. He shows⁷⁹ that, due to a paper authored by G. Peters,⁸⁰ the Camp Administration had been aware of the advanced *delousing* technique using Zyklon B since 1941. Without documenting his reasoning, he interprets the camp administration’s interest in this paper to the effect that this new *disinfestation* technology was to be implemented in Bunker 2, which is said to have been remodeled a while later in order to kill *human beings* in it. In the end, however, according to Pressac’s utterly unfounded allegations, they refrained from doing so because the suppliers allegedly had difficulties in keeping up with the demand, and so Bunker 2, like Bunker 1, was operated without heating or ventilation.

A nugget of absurdity truly worth savoring: the camp administration, while being fully aware of the advanced methods available for Zyklon-B *delousing* facilities, allegedly resorted to sledgehammer methods to gas people not only in Bunkers 1 and 2, but later on in all other crematoria as well, while at the same time there were no noteworthy production delays to interfere with the construction of hundreds of advanced delousing chambers throughout German-occupied Europe, and even in the new *Zentralsauna* of Auschwitz-Birkenau! The Germans even developed the nowadays-well-known microwave technology

Table 1: Equipment and suitability of actual or alleged “gas chambers”

Equipment Building	Poison gas introduction	Heating	Venti- lation	panic proof	Suitable for disinfestation	Suitable for mass homicide
Disinfestation room	○	●	●	○	yes	if panic-proof
Crematorium I	×	×	●	×	perhaps	no
Crematoria II and III	×	×	●	×	perhaps	no
Crematoria IV and V	×	●	×/●	×	no/yes	no
Bunker 1 and 2	○	×	×	×	no	no

● = present or possible; ○ = possibly present; × = not present

– to kill lice! They installed those extraordinarily expensive facilities exclusively in Auschwitz to save the lives of the inmates!⁸¹ And we are to believe that the Germans couldn’t get hold of the material required to install proper Zyklon-B delousing technology in their homicidal ‘gas chambers’?

2.5. Engineering Conclusions

Since every room can be deloused with Zyklon B, every room could be considered as serving as a delousing facility in principle. But even the most-primitive delousing facilities which were used more than just occasionally – whether in the early days of Auschwitz, or elsewhere – would have been equipped with an exhaust ventilator and frequently even with a heating system, of which the latter is helpful but not absolutely necessary (for details see Section 4.1.). But no room not possessing a ventilation system may be considered as a room for repeated application of poisonous gases, whether to kill vermin or human beings. Homicidal gas chambers must furthermore be panic-proof, and – ignoring the entry door(s) – have to be equipped with a way of introducing or releasing the poison-gas material into the chamber. Although the latter is not absolutely necessary for disinfestation installations, it is nevertheless useful. It must be concluded, therefore, that no installation possessing either no means of applying the poison from the outside, or no possibility of forced ventilation, or which could not be sealed in a panic-proof manner, can seriously be considered to serve as a homicidal gas chamber. When summarizing the features of the rooms discussed above under these aspects, Table 1 ensues.

Not taken into consideration in the above, among other things, is the fact that the ventilation system of hypothetical homicidal “gas chambers” would have to be efficient enough for homicidal purposes.

Although we have some information about the equipment of the rooms in Crematoria IV and V, the information is, to a certain extent, speculative due to the lack of documents and material evidence. This applies even more so to the bunkers, on which practically no documents exist.

Fortunately, it is precisely the one “gas chamber” in which the largest number of people was allegedly killed by poison gas during the Third Reich that has remained intact to some degree: Morgue #1 of Crematorium II. Contrary to all witness testimony, this cellar, during the period of its operation, possessed no Zyklon-B-introduction holes in the roof, and none of its equipment (door, alleged introduction columns) was panic-proof. It is only logical and consequential to apply these conclusions also to the mirror-symmetrically built, but otherwise-identical Crematorium III, even though we do not possess any physical evidence for this due to the almost complete destruction of the roof of its Morgue #1. If this is so, then those rooms cannot have been used for mass homicide using poison gas, as alleged by witnesses.

So much for the claim that homicidal “gas chambers” existed at Auschwitz. We have also proven that the largest room, the one allegedly most-often used as a homicidal gas chamber, could not have been used for that purpose as stated by alleged witnesses.

⁸¹ See H.J. Nowak, *op. cit.* (note 31), and W. Wallwey’s contribution in this volume; for a synopsis about the general efforts of the German authorities to protect the inmates’ lives see M. Weber, “High Frequency Delousing Facilities at Auschwitz,” *JHR*, 18(3) (1999), pp. 4-13.

3. Zyklon B and Its Effects

3.1. The Poison Gas Hydrogen Cyanide (HCN)

Hydrogen cyanide (HCN) blocks the oxygen supply to the cells, preventing the oxidation processes vital for cell life.⁸² Due to the brain's great sensitivity to lack of oxygen, a person who has inhaled high concentrations of HCN suffers less (but still intensively) than a person who has swallowed cyanide salts (e.g., KCN), which results in heavy and extremely painful muscle cramps. A dose of 1 mg HCN per kg body weight is generally considered fatal, whereas non-lethal doses of HCN are quickly eliminated by the body, usually without further consequences. The bright-red color of the blood and of postmortem lividities are typical findings in HCN-related deaths.⁸³

It is generally advisable to avoid perspiring when handling HCN, since damp skin absorbs HCN most readily.

While toxicological literature agrees on the effects of certain concentrations of HCN in air, a study conducted by the U.S. Army Chemical Corps revealed that the values cited across the literature were gained prior to World War I by experiments conducted in rabbits. Experiments with larger mammals, including humans, showed, however, that the sensitivity to gaseous HCN decreases with the size of the animal. In other words, the values listed in the literature are incorrect. Humans are, in fact, much more resilient when exposed to gaseous HCN.⁸⁴

The only really reliable data are those gathered during executions with hydrogen cyanide as carried out in the United States. In his thoroughly researched book on homicidal gasings in the U.S., Scott Christianson has collected a wealth of data showing execution times ranging from a mere 30 seconds up to 18 minutes.⁸⁵ An analysis of 113 HCN executions performed at the San Quentin Penitentiary in California showed an average time to loss of consciousness of 5 minutes, and an average time of 9.3 minutes until death.⁸⁶ Another investigation showed that on average brain activity (consciousness) continues for 2 to 5 minutes after the start of the execution, while the heart keeps beating for 5 to 7 minutes and longer, whereas actual death occurs after 10 to 12 minutes and more.⁸⁷ I will get back to these data when discussing homicidal gasings in Subchapter 4.2.

3.2. The Fumigant Zyklon B

Insects and especially their eggs are considerably less-sensitive to HCN. For the most part it is necessary to expose them for several hours to rather high concentrations (0.3 to 2%/vol.) before their death is certain. Right until the end of World War Two, *Zyklon B*, a substance produced and licensed by the company DEGESCH of Frankfurt/Main, was of paramount importance in combating insects and rodents in food storerooms, large-capacity transports (trains, ships), public buildings, barracks, prisoner-of-war camps, concentration camps, and

⁸² More-specifically: the cyanide. To avoid confusing the reader with specialized terminology, I will use the term 'hydrogen cyanide' wherever possible in the following, and ask the experts to kindly pardon the generalization.

⁸⁷ *Ibid.*, p. 209.

of course for hygiene and for disease control in general in many countries around the world.⁸⁸ The Zyklon B allegedly used for gassing human beings consisted of granules of gypsum mixed with starch $\frac{1}{4}$ " to $\frac{1}{2}$ " in diameter and infused with hydrogen cyanide (named "Ereco" by DEGESCH).⁸⁹ The evaporation of the poison gas from its carrier substance proceeds rather slowly. The evaporation characteristics were documented in 1942 by an employee of DEGESCH.⁹⁰ On dry air of 15°C (59°F), HCN evaporated from the carrier as indicated in Graph 1, *i.e.*, it took 1.5 to 2 hours until 90% of the HCN had been released.

At lower temperatures, this process slows down at a rate proportional to the decreasing vapor pressure of the HCN. It is worth noting that according to Irmscher the evaporation rate decreases considerably if the surrounding air has a high relative humidity, as must be expected in unheated underground rooms filled with many human beings. The reason for this is that the Zyklon-B carrier cools down as the HCN evaporates. Subsequently, water from the surrounding humid air condenses on the carrier. Since HCN is extremely soluble in water, the damp carrier releases the remaining HCN only extremely slowly.

For future reference, it may be stated that, at a temperature of 15°C (59°F) and low relative humidity in the air, not more than 10% of the HCN would have evaporated from the carrier substance during the first five minutes. If the air was saturated with humidity, the process would have slowed down easily multiple times.

Graph 1: Speed of vaporization of HCN from the carrier substance of Zyklon B (HCN on gypsum) at various temperatures and finely dispersed, according to R. Irmscher/DEGESCH.⁹⁰

3.3. Hydrogen-Cyanide Residue

3.3.1. Formation

If the hydrogen cyanide from the Zyklon B had bonded with the brickwork only through the process of adsorption, then due to the volatility of hydrogen cyanide (boiling point: 25.7°C/78.3°F) it would no longer be possible today to detect any hydrogen-cyanide residues in the remaining walls. But even a brief glance into the clothing disinfection chambers of Buildings 5a and 5b of Birkenau (see cover illustrations) immediately shows a chemist that what he is in fact dealing with is a very common substance: iron blue,⁹¹ an extremely

⁸⁸ For a comprehensive history of Zyklon B, including mass gassing claims, but hardly offering more physical data of the product, cf. Jürgen Kalthoff, Martin Werner, *Die Händler des Zyklon B*, VSA-Verlag, Hamburg 1998; for a more product-oriented monograph see Horst Leipprand, *Das Handelsprodukt Zyklon B: Eigenschaften, Produktion, Verkauf, Handhabung*, GRIN Verlag, Munich 2008; www.grin.com/de/e-book/150878/dashandelsprodukt-zyklon-b. For more details see Subchapter 5.2. of my book *The Chemistry of Auschwitz*, *op. cit.* (note 26), esp. pp. 68-76.

⁸⁹ An x-ray-spectroscopic analysis of Zyklon-B pellets left behind in Auschwitz by the SS revealed the carrier material as being basically pure gypsum: Harry W. Mazal, "Zyklon-B: A Brief Report on the Physical Structure and Composition," <http://phdn.org/archives/holocaust-history.org/auschwitz/zyklonb/> (undated; the spectrograms are dated July 20, 1998).

⁹⁰ R. Irmscher, "Nochmals: 'Die Einsatzfähigkeit der Blausäure bei tiefen Temperaturen'," *Zeitschrift für hygienische Zoologie und Schädlingsbekämpfung*, 34 (1942), pp. 35f.

⁹¹ Iron-blue pigment is the international standard name (ISO 2495) for ferrous-cyanide blue pigments of various compositions which are also known as Berlin Blue, Turnbull's Blue, Prussian Blue, Vossen Blue®, Milori Blue, Parisian Blue, French Blue, China Blue, Bronze Blue, Steel Blue, Ink Blue, etc.

stable compound formed by the interaction of hydrogen cyanide with iron (ferrous cyanide⁹²).

Iron is an element almost ubiquitous in nature, occurring most commonly as ferric oxide ('rust'). The sand used for concrete and mortar, for example, contains up to 4% iron, while Portland cement contains between 2 to 5% iron.⁹³ In general, the iron – in the form of rust – is the reason why building and similar materials (concrete, mortar, plaster, but loam and clay as well) are frequently ochre or red.

So how does the iron-blue pigment form? First the hydrogen cyanide must accumulate in the brickwork. A cool and therefore damp wall is conducive to this process, since hydrogen cyanide is most readily soluble in water. Accordingly, cool (10°C/50°F) basement walls with a moisture content some ten times greater⁹⁴ than that of warm, dry rooms (20°C/68°F) also have an approximately eight times greater tendency to become enriched with hydrogen cyanide.⁹⁴ A damp environment (*i.e.*, wall) is also of prime importance for the further steps involved in the chemical conversion into iron blue. Additionally, an alkaline environment is more suitable to accumulate HCN than an acidic one, since under alkaline conditions HCN is rapidly converted into simple (non-complex and not very stable) cyanide salts. The conversion from HCN to cyanide salts is a necessary step for the formation of stable iron-cyanide complexes, since only the cyanide ion (CN⁻) is able to react with iron, which includes both a simple linking process (formation of complex salts) and a partial reduction of the oxidation state of Iron from III (as normally found in nature) to II, which is supported by an alkaline medium.⁹⁵ In fact, regarding the formation of iron blue apart from humidity and alkalinity all other factors are secondary.⁹⁶ The exact influence of each factor is still unknown, though.

In Germany of the 1970s, two cases have been reported that I know of where iron blue developed after just a single Zyklon-B fumigation in buildings of high dampness and alkaline plasters. This caused severe damage, since the only way to get rid of this pigment was to knock off and redo the entire plasterwork.⁹⁷ From these cases it can be concluded that already a single gassing can suffice if the walls of the premise are wet, porous and alkaline. But the formation of iron-blue compounds in a room of a building in Majdanek Concentration Camp, which was converted to a Zyklon-B delousing chamber after having been used for other purposes for several months, shows that even older, no-longer-alkaline mortar and plaster are able to form huge amounts of iron blue.⁹⁸

⁹² Cyanides (CN⁻-compounds) are hydrogen-cyanide (HCN) salts. In this case, specifically ferro(III)-ferri(II)-cyanide, but one can expect to find all sorts of iron-cyanide compounds in mortar of facilities exposed to HCN.

⁹³ Cf., e.g., K. Wesche, *Baustoffe für tragende Bauteile*, 2 vols., Bauverlag, Wiesbaden 1977, esp. Vol. 1, p. 37, Vol. 2, pp. 51f.

⁹⁴ L. Schwarz, W. Deckert, "Experimentelle Untersuchungen bei Blausäureausgasungen," *Zeitschrift für Hygiene und Infektionskrankheiten* 107 (1927), pp. 798-813; *ibid.*, 109 (1929), pp. 201-212.

⁹⁵ This point causes some confusion even among chemists since it is obviously not known that cyanide itself is a reducing agent, and that Fe(CN)₆³⁻ is a strong oxidizing agent especially in alkaline medium, cf. M. Andrew Alich, D.T. Haworth, M. Frances Johnson, "Spectrophotometric Studies of Hexacyanoferrate(III) Ion and its Reaction with Iron(III) in Water and Ethanol", *Journal of Inorganic and Nuclear Chemistry* 29 (1967), pp. 1637-1642; J.C. Bailar, *Comprehensive Inorganic Chemistry*, Vol. 3, Pergamon Press, Oxford 1973, p. 1047; Reed M. Izatt, Gerald D. Watt, Calvin H. Bartholomew, James J. Christensen, "Calorimetric Study of Prussian Blue and Turnbull's Blue Formation," *Inorganic Chemistry* 9 (1970), pp. 2019-2021; J.F. de Wet, R. Rolle, "On the Existence and Autoreduction of Iron(III)-Hexacyanoferrate(III)," *Zeitschrift für anorganische und allgemeine Chemie*, 336(1-2) (1965), pp. 96-103.

⁹⁶ I will spare the reader a discussion of the minor effects of other properties of wall materials on cyanide accumulation and the speed of chemical conversion, and refer instead to G. Rudolf, *The Chemistry...*, *op. cit.* (note 26), pp. 190-204, 216-226.

(translation in Appendix 1 at the end of this volume); a church in Untergriesbach, also Bavaria: www.pfarrei-untergriesbach.de/pfarbrief11.htm. E. Emmerling, in M. Petzet (ed.), *Holzschädlingsbekämpfung durch Begasung*, Arbeitshefte des Bayerischen Landesamtes für Denkmalpflege, Vol. 75, Lipp-Verlag, Munich 1995, pp. 43-56, mentions another case, but it is not clear whether this really is a new, different case.

⁹⁸ Cf. J. Graf, C. Mattogno, *op. cit.* (note 29), pp. 147-151. See C. Mattogno's contribution about the Maj-

3.3.2. Stability

The relevant literature consistently describes iron blue as an extremely stable pigment. It is insoluble in water,⁹⁹ resistant to acid rain¹⁰⁰ and also surprisingly resistant to sunlight.¹⁰¹ When exposed to weathering, other compounds of hydrogen cyanide will even convert preferentially into iron blue.

Three examples will demonstrate the environmentally resistant nature of iron blue. First, the outside walls of the Birkenau delousing buildings, which are stained blue by iron blue, have lost none of their color despite 50 years of exposure to the adverse environmental conditions of the industrial region of Upper Silesia.¹⁰² One might now object that the soluble compounds of hydrogen cyanide in the interior of the walls gradually migrate to the surface, thereby making up for any loss caused by surface erosion and thus only 'simulating' long-term stability. However, a long-term test begun in the 1950s to ascertain the environmental resistance of paints has clarified this matter. In this test, many pigments including iron blue and iron oxide (*i.e.*, rust) were tested by applying them only superficially and without protective coating onto an aluminum sheet. After more than 20 years' exposure to the air of a western industrial suburb of London, two pigments exhibited the least (barely noticeable) changes: iron blue and iron oxide.¹⁰³ Even scattered on the ground, iron blue remains stable and fixed for decades, as tests in gas works shut down decades ago have shown. In this case the iron blue obtained in the city's gas works was used as a herbicide, and is still present today in virtually undiminished quantities.¹⁰⁴ Therefore, if iron blue has formed on and *inside* a wall, one may expect to find a long-term stability similar to that of the iron oxide from which it formed.

Thus, once noticeable quantities of hydrogen-cyanide salts have accumulated in brickwork, and once-damp conditions have allowed these to convert into iron blue, then no appreciable reduction in iron-cyanide content is to be expected after 50 years.

A typical example of the way the media deal with these facts is the report that was issued by the German press agency *dpa* and carried on March 29, 1993 in almost all major German daily newspapers and even in some radio news broadcasts, in which it was claimed that, according to an unnamed expert, the hydrogen-cyanide salts at issue here have a life of only a few months.¹⁰⁵ Inquiries at the Stuttgart *dpa* office responsible for this press release re-

danek Concentration Camp in this volume.

⁹⁹ The literature frequently gives only the rather unsatisfactory term 'insoluble.' For more details see G. Rudolf, *The Chemistry...*, *op. cit.* (note 26), pp. 204-210.

¹⁰⁰ Iron blue is considered an acid-resistant pigment; cf., e.g., B. J. A. Sistino, in Peter A. Lewis (ed.), *Pigment Handbook*, Vol. 1, Wiley, New York 1974, pp. 401-407; no appreciable decomposition occurs until the pH drops below 1. The pH of iron-blue suspensions, for example, is around 4-5; H. Ferch, H. Schäfer, *Schriftenreihe Pigmente*, 77, Degussa AG, Frankfurt 1990. For a pH-redox stability diagram see Rajat S. Ghosh, David A. Dzombak, Richard G. Luthy, "Equilibrium Precipitation and Dissolution of Iron Cyanide Solids in Water," *Environmental Engineering Science*, 16(4) (1999), pp. 293-313, here p. 309; reproduced in G. Rudolf, *The Chemistry...*, *op. cit.* (note 26), p. 210.

The chemistry of iron cyanides in soil is actually rather complex. In particular, if the soil has a low redox potential, iron blue actually becomes unstable (iron(III) is reduced to iron(II)), and the decomposition products become quite mobile. Since masonry is thoroughly oxygenated, its redox potential is rather high, so this does not affect our present considerations. For details see G. Rudolf, *The Chemistry...*, *op. cit.* (note 26), pp. 213-215.

¹⁰⁵ Cf. *Süddeutsche Zeitung*, *Die Welt*, *Stuttgarter Zeitung*, and *Südwest Presse*, all of March 29, 1994. This fabricated press release was since quoted frequently by several German officials, especially in German

vealed that the editor in charge, Albert Meinecke, had invented this ‘expert opinion’ out of thin air. Evidently even the *dpa* press agency does not shy away from issuing false reports.¹⁰⁶

4. Gassings

4.1. Disinfestation of Material Objects⁸⁸

Initially, ordinary rooms were turned into disinfestation facilities modifying ordinary rooms in a makeshift way in terms of making windows and doors as gas-tight as possible, providing adequate heating and a ventilation system. Workers wearing protective masks distributed the Zyklon B evenly on the floor of the room stocked with the items to be fumigated. This procedure was similar to that used at the time for the fumigation of normal rooms for purposes of disinfestation.

Later, special facilities were constructed that were equipped with powerful heating, ventilation and air-circulation systems. These facilities had a relatively small volume to avoid any dead space, *i.e.*, to conserve the rather-costly insecticide.

Depending on the facilities and on the kind of vermin to be exterminated, the concentrations of hydrogen cyanide varied from 0.5 to 2%/vol., while the duration of use ranged from less than 2 hours to 10 hours and more.

The delousing chambers of Buildings 5a and 5b in Birkenau had been constructed especially for delousing purposes (with ventilation facilities, heating, windowless), but their size and design made them very expensive and inefficient to operate. They had an area of approximately 130 m² and a volume of at least 400 m³. The room reached all the way up to the roof, which was covered only with leaky fiberboards from the inside. Thus, a good third of the space was unusable dead space. The walls were plastered with cheap lime plaster, which soaked up hydrogen cyanide like a sponge. The operation of the plant entailed therefore a great waste of Zyklon B.

Using the entire room as delousing chamber would require quantities of Zyklon B containing at least 4 to 5 kg hydrogen cyanide, if assuming an applied concentration of 10 g hydrogen cyanide per m³.¹⁰⁷ Assuming one fumigation cycle per day, these facilities alone would have consumed 3.6 metric tons of Zyklon B a year, which corresponds to almost 50% of the entire quantity of Zyklon B delivered to Auschwitz in 1942, where the total amount delivered was 7.5 tons.¹⁰⁸ As a result, one of the buildings (Building 5a) was subsequently remodeled, with the large disinfestation room being subdivided into smaller rooms with a concrete ceiling, serving as hot-air disinfestation units.

If one considers that other hydrogen-cyanide delousing facilities of various sizes existed in the Main Camp and in Birkenau, and that inmates’ barracks were also fumigated with this insecticide on occasion,¹⁰⁹ then it becomes apparent that the quantities of Zyklon B supplied to Auschwitz can be explained by the normal disinfestation operations.

Landes- und Bundesverfassungsschutzberichten (Report of State and Federal Agencies for the Protection of the Constitution), *e.g.*: Bayerisches Staatsministerium des Innern, *Verfassungsschutzbericht 1997*, Munich 1998, p. 64.

¹⁰⁶ Cf. G. Rudolf, “Über die frei erfundene Expertenmeinung der ‘dpa’,” *DGG* 42(2) (1994), pp. 25f.; reprinted as “Fälscherwerkstatt dpa,” in G. Rudolf, *Auschwitz-Lügen*, *op. cit.* (note 11), pp. 119-131.

¹⁰⁷ The mass declarations on Zyklon-B cans always referred to the net HCN content, which was about 30-40% of the entire mass of the contents, *i.e.*, 60-70% of the mass were due to the carrier.

¹⁰⁸ Office of Chief of Counsel for War Crimes, affidavit of A. Zaun, Hamburg, Oct. 24, 1945, Document No. NI-11,396, quoted according to U. Walendy, *Auschwitz im IG-Farben-Prozeß*, Verlag für Volkstum und Zeitgeschichtsforschung, Vlotho 1981, p. 62.

¹⁰⁹ The documental and witness accounts of such fumigations are numerous, *e.g.*, the order issued on Aug. 12, 1942, by Camp Commandant Höß regarding accidents during the fumigation of barracks; J.-C. Pressac, *op. cit.* (note 10), p. 201. See the analysis of Zyklon-B deliveries to, and usage by, the Auschwitz Camp by C. Mattogno, *op. cit.* (note 28), pp. 444-452.

4.2. The Gassing of Human Beings

4.2.1. Eyewitness Testimony

4.2.1.1. Scenarios

Pressac has at times some quite harsh words to say about the lack of trustworthiness and credibility of eyewitness testimony.¹¹⁰ He attempts to explain the untruths, impossibilities and exaggerations, and in many cases he “corrects” them by using his own fanciful and arbitrary opinions.¹¹¹ For example, Pressac estimates the numbers of victims per gassing as considerably less than do the eyewitnesses, who frequently tell of several thousand victims per cycle.¹¹² Since the number of victims in Auschwitz has been officially reduced from four million to approximately one million since mid-1990,¹¹³ Pressac, drawing primarily on a work by Auschwitz-Museum employee Danuta Czech,¹¹⁴ has manipulated the claims of the witnesses to reflect these new figures.

The following describes the procedures of the alleged homicidal gasings for the individual Auschwitz facilities, as Pressac believes he can reconstruct them following his “correction” of the eyewitness testimony [my comments in brackets]:

Crematorium I:

500 to 700 victims undressed outdoors. The ‘gas chamber’ (morgue) was entered via the furnace room. [Passing heaps of corpses from the last batch which were awaiting their cremation. This scenario appears to be unbelievable, since it required that the inmates passing these heaps would have stayed calm.] Zyklon B was introduced through [nonexistent] input shafts. After the victims had died (some 5 minutes later [which is impossible]) the ventilators were turned on. After 15 to 20 minutes of ventilation, the door to the furnace room was opened. The chamber was cleared – sometimes without the use of gas masks on the part of the workers [which would have been very dangerous, if not fatal] – and the victims were cremated.¹¹⁵ According to Pressac, only a few gasings took place here, with a total of less than 10,000 victims.¹¹⁶

Crematoria II & III:

800 to 1,200 victims undressed in Morgue 2 underground. They entered Morgue 1 (the ‘gas chamber’), also underground. Zyklon B was introduced via [nonexistent] input shafts. After the victims have died (5 minutes [which is impossible]), the ventilators were turned on. After approximately 20 minutes, the door was opened. The bodies, covered with blood, vomit and feces, were hosed off and removed, usually without the use of gas masks on the part of the workers [which again would have been very dangerous, if not fatal]. Transport of the corpses via small freight elevators to the furnace hall on the ground floor, where they were cremated.¹¹⁷ According to Pressac, the total number of victims for Crematorium II was some 400,000 (one gassing per day on average), 350,000 for Crematorium III.¹¹⁸

¹¹⁰ J.-C. Pressac, *ibid.*, pp. 124f., 162, 174, 177, 181, 229, 239, 379f., 459-502; more succinctly in J.-C. Pressac, *op. cit.* (note 20).

¹¹¹ For a proper critique of testimonies – and as a correction for Pressac’s and van Pelt’s idiosyncrasies – see C. Mattogno’s trilogy *Sonderkommando Auschwitz I* through *Sonderkommando Auschwitz III* (Castle Hill Publishers, 2021f.), and *idem*, *The Making of the Auschwitz Myth*, 2nd ed., *ibid.*, 2021, pp. 105-401; for a more-general critique of Auschwitz-gas-chamber witness testimonies see J. Graf, *Auschwitz: Eyewitness Reports and Perpetrator Confessions of the Holocaust*, *ibid.*, 2019.

¹¹² 2,000 according to C. S. Bendel, 3,000 according to M. Nyiszli: J.-C. Pressac, *op. cit.* (note 10), pp. 471, 473. Rudolf Höß also spoke of 2,000 (IMT, Vol. 33, p. 277), while Michał Kula took the middle ground: 2,500 (Höß Trial, *APMO*, Vol. 25, p. 498).

¹¹³ Cf., e.g., *Jüdische Allgemeine Wochenzeitung*, July 26, 1990; *Hamburger Abendblatt*, July 25, 1990; *Hannoversche Allgemeine Zeitung*, July 18, 1990; *Der Spiegel* 30/91, p. 111; *Süddeutsche Zeitung*, Sept. 21, 1990; *Die Tageszeitung*, July 18 and 19, 1990; *Vorarlberger Nachrichten*, Aug. 22 and 29, 1990.

¹¹⁴ D. Czech, *Auschwitz Chronicle, 1939-1945*, Henry Holt, New York 1990.

¹¹⁵ J.-C. Pressac, *op. cit.* (note 10), p. 125.

¹¹⁶ *Ibid.*, pp. 131f.; J.-C. Pressac, *op. cit.* (note 18), pp. 34f.

¹¹⁷ J.-C. Pressac, *op. cit.* (note 10), p. 253.

¹¹⁸ *Ibid.*, p. 183. Since he posits only some 630,000 victims of the gas chambers in his second book (*op. cit.*, note 20, French ed., p. 148) or even 500,000 (*ibid.*, German ed., p. 202), the corresponding figures

Crematoria IV & V:

Several hundred victims undressed outdoors when the weather permitted, otherwise in the morgue; the victims walked to the ‘gas chamber’ [passing heaps of corpses from the last batch which were awaiting their cremation...]. Zyklon B was thrown in through [cross-barred, hence blocked] input hatches, from a ladder. After 15 to 20 minutes the doors were opened. Bodies were removed to the morgue or outside to the burning pits behind Crematorium V, while the workers sometimes did and sometimes did not wear gas masks [which would be fatal, since there was no ventilation system to reduce the HCN concentration]. According to Pressac, the number of victims is difficult to estimate, presumably approximately 100,000 each.¹¹⁹ The same goes for the so-called Bunkers 1 and 2.¹²⁰

4.2.1.2. HCN Quantities and Execution Times

For the poison-gas concentrations allegedly used during mass gassings, Pressac repeatedly mentions a concentration of 12 grams of hydrogen cyanide per m³, or 1% by volume without backing it up with anything. As far as I know, only one witness ever made statements about the amount of Zyklon B allegedly used:¹²¹ former Auschwitz Camp Commandant Rudolf Höß while in British custody after the war. After having been tortured for three days straight,¹²² he “confessed”, among many other things, that seven one-kg cans were used in Morgue 1 of Crematoria II & III, and five one-kg cans for the “other rooms” (probably referring to the claimed ‘gas chambers’ in Crematoria IV and V). During cold weather, he stated, two to three more cans had to be used.¹²³ Since it is scientifically and legally unethical to use confessions obtained under duress, I abstain from using anything Höß stated for the present purposes.

Another indirect and surely the most conclusive source to determine the quantities of hydrogen cyanide allegedly used are the gassing times attested to by the witnesses. While there are many testimonies about this,¹²⁴ we need to limit ourselves to those who were in a position to know. This is important, because most witnesses – bystanders for the most part – could not possibly have known both when a gassing procedure had started (by throwing in Zyklon B) and when it was declared complete (after all victims had died). The only witnesses who could have had that knowledge with some reliability were the SS physicians who controlled the issuance of Zyklon B and who allegedly directed and supervised the mass murders. In this regard, statements of only four of the about twenty known physicians posted at Auschwitz are known. All of them mentioned execution durations of two to five minutes until the death of *all* victims, but made no statements as to the amounts of Zyklon B used.¹²⁵ Such a

for the individual facilities ought to be reduced further. Following F. Meyer, “Die Zahl der Opfer von Auschwitz,” *Osteuropa*, 52(5) (2002), pp. 631-641 (English online: www.vho.org/GB/c/Meyer.html), who claims only some 356,000 gas-chamber victims, that number would go down even further. However, none of these reduced death-toll figures has ever been accepted by the orthodoxy, so I will not use them here.

¹¹⁹ J.-C. Pressac, *op. cit.* (note 10), pp. 384-390. Since Crematorium IV was badly damaged and permanently shut down right at the start of operation, it is not credible that it was subsequently used for killings.

¹²⁰ I am not dealing in any detail with these phantom facilities here. The interested reader may consult C. Mattogno’s monograph on these figments of the imagination: *Debunking the Bunkers of Auschwitz: Black Propaganda versus History*, 2nd ed., Castle Hill Publishers, Uckfield 2016.

¹²¹ Figures given in works of secondary literature either give Höß as a source or no source at all; see J. Buszko (ed.), *Auschwitz, Nazi Extermination Camp*, Interpress Pub., 2nd ed., Warsaw 1985, p. 118, who mentions 6 to 12 kg without a source; Leon Poliakov, *Harvest of Hate*, Greenwood Press, Westport, Conn., 1971, p. 205, gives 5 to 7 kg, based on Höß; J.-C. Pressac, *op. cit.* (note 10), p. 253, gives 4 to 6 kg without a source.

¹²² On this see C. Mattogno, *Commandant of Auschwitz: Rudolf Höss, His Torture and His Forced Confessions*, 2nd ed., Castle Hill Publishers, Uckfield 2020.

¹²³ Nuremberg Documents NI-034 and NI-036; for details of his confessions see the previous footnote.

¹²⁴ I won’t list them here; see G. Rudolf, *The Chemistry...*, *op. cit.* (note 26), footnote 330 on p. 252 for the long list.

¹²⁵ See *ibid.*, pp. 256-260: Dr. Hans Münch, Dr. Friedrich Entress, Dr. Johann Paul Kremer, Dr. Horst Fischer.

relatively quick execution would require the use of correspondingly large quantities of Zyklon B. The approximate quantity shall be determined in the following.

4.2.2. Criticism of Eyewitness Testimony

I will not deal with thorough criticism of eyewitness testimonies here, which has been done already elsewhere,¹¹¹ but will focus on only two physical issues, and I will ignore the fact that there were no Zyklon-B-insertion shafts in the roofs of the Crematoria I-III (which is a bit grotesque, but otherwise one would have to stop any further analysis). In order to assess the degree to which eyewitness testimony and other accounts of the alleged gassing procedures approximate reality, one must consider the following factors:

1. Was the gassing procedure attested to physically possible, and if so, under what conditions?
2. What time would have been required to ventilate the facilities crowded with bodies? or: were the clean-up operations attested to in the chambers possible?¹²⁶

4.2.2.1. Necessary Quantities of Zyklon B

The challenge for an executioner trying to kill 1,000 victims in an enclosed space of the Auschwitz type using Zyklon B is multifold:

- As experience with executions in the U.S. shows, there are some individuals who do not cooperate with the executioners by staying relatively calm, by holding their breath repeatedly for extended periods of time, and also by having a tough physique which is difficult to overcome. Among one thousand victims, there are bound to be a few of those individuals. Hence, killing all 1,000 victims with certainty requires either an extended period of time or corresponding overdoses of poison. During U.S. executions, it took up to 18 minutes to kill the toughest and most-unruly subjects. Even if we set the moment as relevant where the executee becomes immobile and/or unconscious, this would still be around ten minutes after exposure to the poison gas (see Subchapter 3.1.).
- While the executee in U.S. execution chambers is instantly exposed to the full concentration of the poison gas – some 3,200 to 3,600 ppm – Zyklon B releases its poison only gradually, particularly in rooms filled with air saturated with humidity, and it spreads throughout the large chambers under consideration only slowly, reaching the person standing farthest away from the poison source only with considerable delay.
- The executions in Auschwitz – measured from the point Zyklon B was thrown in to the point when the last person was considered dead – are said to have lasted only between two and five minutes.
- If assuming conservatively that a person standing farthest away from the poison source is not exposed to any poison during the first minute of the execution, for him the effective execution times are between *one* and *four* minutes.
- Furthermore, if assuming that, for the first five minutes of an execution, the concentration rises linearly from zero to its end value after five minutes, this means that any person exposed to that rising concentration would be exposed only to half the end concentration, if averaged over the entire time. Hence, we actually have to *double* the end value at the end of the execution to reach aimed-at average concentration for the entire time.
- Applying Haber's Rule – that speeding up the effects of a poison requires increasing its concentration at an equivalent rate¹²⁷ – indicates that an execution time of one minute would require an *average* concentration in the remotest corner of the chamber that was ten times as high as applied in the U.S. execution chambers (hence 32,000 to 36,000 ppm), while an execution time of four minutes would require a concentration of 2.5 times the U.S. amount (8,000 to 9,000 ppm).
- This means that, for an execution lasting two minutes, at the *end* of those two minutes, the *average* concentration in the chamber must have reached values between 64,000 and

¹²⁶ The following calculations are based on probable assumptions and should be considered as extrapolations only, but this suffices to get an idea of some physical prerequisites to make the claimed scenarios at least nearly possible.

¹²⁷ Cf. Mario Sartori, *The War Gases: Chemistry and Analysis*, van Nostrand, New York 1939, pp. 3f.

- 72,000 ppm, or between 6.4 and 7.2 percent by volume (I continue below with 68,000 ppm for simplicity's sake). For an execution lasting five minutes, this value would amount to 16,000 to 18,000 ppm, or 1.6 and 1.8 percent by volume (I use 17,000 ppm below).
- The conversion factor from ppm to mg per m³ depends on the temperature and relative humidity of the air. Under the condition of interest here, it is around 1.1.¹²⁸ Hence, 17,000 ppm convert to 18,700 mg/m³, while 68,000 ppm convert to 74,800 mg/m³. Given a free air volume of some 444 m³ in the Morgues 1 of Crematoria II and III,¹²⁹ 17,000 ppm amount to 8.3 kg of HCN gas released after *five* minutes, while 68,000 ppm amount to 33.2 kg of HCN gas released after just *two* minutes.
 - Let's now look at Irmscher's Chart (p. 338). To release 8.3 kg of HCN from Zyklon B within *five* minutes under warm yet very-moist conditions would require the application of roughly ten times that amount, hence some 83 kg of Zyklon B, or 83 one-kg cans! To release 33.2 kg of HCN from Zyklon B within just *two* minutes under warm yet very-moist conditions would require the application of some 830 kg of Zyklon B, hence 830 one-kg cans!

While these rough calculations are rather sensitive to the temperature we assume for the chamber and the exact evaporation rates assumed for Zyklon B under these conditions (for which no empirical data exists), the end results remain clear no matter what: it wouldn't have worked. Zyklon B simply doesn't allow for quick executions, if no auxiliary devices are used such as hot air fans and air-circulation features which evaporate and dissipate the gas quickly throughout the entire chamber. While standard fumigation chambers had those devices, allowing for fumigations to last only just over an hour, the alleged homicidal gas chambers of Auschwitz (or anywhere else, for that matter) supposedly had none of these features.

4.2.2.2. Speed of Ventilation of the 'Gas Chambers'

While the morgue of Crematorium I had a very crude ventilation system that barely sufficed to evacuate the foul smell of corpses inevitably developing in such a place,¹³⁰ Crematoria II (and later its mirror image Crematorium III) in Birkenau were planned right from the planning start in late 1941 with a system that was well suited for morgues, at a capacity of just under 10 air exchanges per hour, which is standard for an intensely used morgue.¹³¹ Although the originally planned electric motors powering all ventilation systems of the entire building were upgraded in early 1942 when it was realized that the pressure loss due to friction in the ventilation ducts was greater than initially anticipated, the blowers themselves which defined the systems' capacities remained unchanged. Interestingly, the ventilation system of Morgue 1 had a smaller capacity than the systems of the other morgue (Morgue 2) and the autopsy room.¹³²

If any criminal remodeling of this building would have occurred in late 1942/early 1943, as the orthodox claims, the ventilation capacity for Morgue 1 would have been drastically increased, plus a means of switching the system to air circulation with some heating ability would have been included so Zyklon B could have been placed somewhere in the ducts, away from the victims, but right in the hot-air flow of a circulating ventilation system. But that never happened.

Considering the exorbitant amounts of Zyklon B that would have been needed for the quick executions claimed for these buildings (see previous subsection), any attempt at ventilating the room could not have been successful for hours, especially if the Zyklon B had

¹²⁸ For the exact math see G. Rudolf, *The Chemistry...*, *op. cit.* (note 26), pp. 235f.

¹²⁹ 30 m × 7 m × 2.4 m = 504 m³ of Morgue 1 minus 1,000 × 0.060 m³ (volume of victims including the presence of some children).

¹³⁰ On the history and features of this room's ventilation system see C. Mattogno, *Auschwitz: Crematorium I...*, *op. cit.* (note 38), pp. 17-23.

¹³¹ Wilhelm Heepke, *Die Leichenverbrennungs-Anstalten (die Krematorien)*, Verlag von Carl Marhold, Halle, p. 104.

¹³² For details see C. Mattogno in: G. Rudolf (ed.), *Auschwitz: Plain Facts*, *op. cit.* (note 21), pp. 173-176, and excessively detailed in C. Mattogno, "The Ventilation Systems of Crematoria II and III in Birkenau," *Inconvenient History*, 9(3) (2017).

simply been dumped into the room (as is claimed for Crematorium I and also for Crematoria II and III by some witnesses). This all the more so because the Zyklon-B pellets, trapped under corpses would have released their poison for at least an hour, and the noxious fumes would have been very difficult to remove from between the collapsed victims.

Fortunately for the orthodoxy, there are several witnesses who claim that Morgue 1 of Crematoria II and III had some wire-mesh columns protruding through the claimed (but non-existent) Zyklon-B-introduction holes. In these columns, it is alleged, a device could be inserted *and then removed* that contained the Zyklon B. Key witness for that claim is Michał Kula, a Polish Auschwitz inmate who has described this device twice, but in so doing contradicted himself. If we follow the description he gave under oath while testifying during the show trial against Rudolf Höß, then this devices consisted at its innermost layer of a removable sheet-metal column 2.5 m high and 15 cm wide and deep surrounded at a distance of just 1.5 cm by a green fly screen.¹³³ The Zyklon B is said to have been poured into the narrow space between the sheet-metal column and the fly screen. The problem with this is that pouring granules of 0.5 to 1 cm in size into such a narrow space would have led to the pellets jamming the slit.¹³⁴ Only pouring the Zyklon B in very slowly – almost grain by grain – could have prevented that. But once the first mass murder had been accomplished that way and the column was removed from the chamber, it would have been impossible to get the granules out of that slit, as these gypsum pellets, onto which the air's humidity would have condensed profusely, would have gotten very gooey, sticking to each other and to the fly screen. That column could have been used only once.

I abstain from discussing Crematoria IV and V as well as the sinister bunkers here, because none of them is said to have had any ventilation system (Crematorium V at least until late spring of 1944), and it is an insult to any thinking creature to suggest seriously that anyone in their right mind would ever consider using such a facility for the repeated, massive application of any kind of poison gas, in particular where the gas-emitting pellets are said to have been trapped under a pile of corpses, hence could not even have been removed to facilitate any natural ventilation. It never happened.

4.2.3. Evaluation of Eyewitness Testimony

Under the given technical conditions, the executions with Zyklon B as recounted by the witnesses would not under any circumstances have been possible as rapidly as some allege ('a few moments,' 'immediately'), and 'within a few minutes' only if enormous quantities of Zyklon B had been used – which would have been nonsensical (too costly), dangerous and awkward at once. In such a scenario, the walls of the chambers would have been exposed to high concentrations of hydrogen cyanide for long periods of time. Mass executions with HCN in huge rooms would have required the application of gaseous HCN, blown in and evenly distributed by fans, or pure liquid HCN, evaporated and distributed by a combined heating and ventilation device.¹³⁵

The alleged entering of the 'gas chambers' without safety measures, the hard work performed in them – sometimes done bare-chested and while eating and smoking – and the simultaneous claim that great quantities of poison gas were used, combine to prove these witnesses guilty of making false statements.

In the face of all this, anyone approaching this issue from a scientific and technical perspective cannot but conclude that the alleged murderers went to great lengths to devise the most-expensive, -complicated, -dangerous and -problematic way to kill people *en masse*. For example, the coal-refining BUNA works of I.G. Farbenwerke AG, only a few miles

¹³³ Höß Trial, *APMO*, Vol. 25, p. 498; see my discussion in G. Rudolf, *The Chemistry...*, *op. cit.* (note 26), pp. 148-156.

¹³⁴ There is actually an entire science surrounding the jamming of narrow openings by flowing granules, see for instance Dietmar Schulze, *Pulver und Schüttgüter: Fließeigenschaften und Handhabung*, 2nd ed., Springer, Berlin/Heidelberg 2009. On page 302, it gives a minimum size required for the smooth flow of items, indicating that, for rough surfaces such as a fly screen, a clear passage of six times the largest flowing grain size would be required, meaning 6 cm in our case.

¹³⁵ This is also the opinion of the French chemical expert on hydrogen cyanide B. Clair, *op. cit.* (note 24), who otherwise strongly disagrees with my conclusions; *i.e.*, he believes in the NS 'gas chambers.'

away, could easily have provided a cheap supply of coal gas high in carbon monoxide for poisoning, or bottled nitrogen for asphyxiation.¹³⁶ But in Auschwitz, of all places, it had to be the expensive, scarce and awkward-to-use Zyklon B, even though it was badly needed everywhere else for pest control.

One must realize that, at the time of construction of these alleged ‘gas chambers,’ the technology for fumigating material objects had advanced greatly, and the mass production of such facilities was in full swing. From everyday practical experience in delousing, the difference in time and material (Zyklon B) requirements between fumigations with and without air circulation will have been well-known. One might therefore expect the application of at least similar technological provisions for the alleged homicidal gassing facilities, but clearly nothing even remotely approaching such standards was in fact used.

I will only comment briefly on the widely held belief that the poison gas entered the alleged execution ‘gas chambers’ via showerheads. In Zyklon B the active substance hydrogen cyanide is adsorbed on the solid carrier substance, gypsum, and is released only gradually. Since the poison is neither a liquid nor a gas under pressure, the hydrogen cyanide from this product could never have been channeled through narrow water pipes and showerheads. Any showers, real or fake, could thus only have served to deceive the victims, but never to introduce the poison gas. Even with all the arguing and dissension that characterizes the overall subject, there is a general consensus on this particular point.

The fantastic, even surreal nature of the claims made about the alleged ‘gas chambers’ of Auschwitz should have become rather clear by now. Of course, there will always be individuals who prefer to believe those who claim to have been there and to have seen it with their own eyes, just as the thousands of witnesses centuries ago insisted that they had seen with their own eyes how the witches flew on broomsticks and had sex with the devil.

5. Evaluation of Chemical Analyses of Masonry

5.1. The Samples

Before taking sample material from the alleged Auschwitz ‘gas chambers’ one ought to verify that the material is in fact original, and to investigate its post-war history. The foundation walls of Crematoria IV and V visible today were erected after the war by the museum administration.¹³⁷ Since the origin of the material used is uncertain, it hardly makes sense to take samples here.¹³⁸ By incredibly good luck, however, the ‘gas chamber’ (Morgue 1) of Crematorium II has largely survived intact. Aside from the two holes in the ceiling discussed in 2.4.1. (Illustration 7, 8), the building materials are not only indisputably original and unaltered, but are also largely protected from weathering by the ceiling. Furthermore, according to Pressac, this room was allegedly the central site, so to speak, of alleged mass murder. This is where most of the gassings are said to have occurred. Taking samples here is thus appropriate not only by virtue of the original nature and history of the material, but also due to the results which an analysis may be expected to return. If iron-blue residue is to be expected in homicidal ‘gas chambers,’ then here is where one should strike pay dirt. To date there have been four samplings worth mentioning: by Leuchter,¹ Rudolf,^{18/26} Ball¹³⁸ and und Markiewicz et al.¹² The reader is referred to these sources for details on sample collection and characterization.

5.2. Analytical Methods

While Leuchter, Rudolf and Ball had their samples analyzed using a method that can reliably detect all cyanide components even in solid samples, including insoluble iron cyanides, Markiewicz and colleagues intentionally chose a method which cannot detect insoluble cyanides of the iron-blue type. I discuss this choice in Subchapter 5.4.

¹³⁶ A more detailed discussions of the pros and cons of different poisonous gases which could have served for mass murder can be found in G. Rudolf, *The Chemistry...*, *op. cit.* (note 26), pp. 295-298.

¹³⁷ Aside from the statements of J. Markiewicz *et al.*, *op. cit.* (note 12, 1994), cf. also J.-C. Pressac, *op. cit.* (note 10), p. 390.

¹³⁸ J.C. Ball, *The Ball Report*, Ball Resource Service Ltd., Delta, B.C., Canada 1993; now included in G. Rudolf (ed.), *Air-Photo Evidence*, *op. cit.* (note 78), pp. 113-117.

One major challenge when analyzing masonry samples is the presence of carbonate. Concrete, mortar and plaster samples that are several decades old are all carbonated to a high degree, hence contain major quantities of carbonates mainly in the form of calcium carbonate (CaCO_3). Meeussen *et al.* have determined that large amounts of carbonate mimic the presence of cyanide traces.¹³⁹ It also needs to be kept in mind that all the analytical methods used were designed for liquid samples, but are expected to be less sensitive and reliable when used for solid samples as in our case.

I had tested samples again – by a different lab – that, during a first analysis, had cyanide values close to the detection limit, meaning the lowest level at which the target chemicals can be detected reliably. The results came back negative, highlighting the fact that analytical results close to the detection limit – usually given as 1 mg per kg of sample material – are not reliable, be that due to the sample being solid (as opposed to liquid) or due to the interference of carbonates. Hence, concentrations of less than 10 mg/kg in samples rich in carbonates are unreliable and must therefore be considered null.

5.3. Results of the Analyses

Table 3 summarizes the most important results of the analyses of material samples for cyanide content (cyanides = hydrogen-cyanide compounds). The first part of the Table reflects samples taken from alleged 'gas chambers.' The second section pertains to samples from delousing chambers. The third shows the results of analyses of samples relating neither to 'gas chambers' nor to delousing chambers. This would actually also be the proper category for all samples taken from the reconstructed foundations and foundation walls of Crematoria IV and V as well as from the farmhouses ('bunkers'), whose building materials are of unknown origin. One can thus observe that the alleged 'gas chambers' exhibit the same concentrations of hydrogen-cyanide residue as any building selected at random – namely, none that is great enough to be reliably detected or interpreted. The unreliability of detecting low cyanide residues is additionally proven by a sample from a collapsed Bavarian farmhouse, my Sample No. 25, which has the highest cyanide level of all samples of this group (9.6 mg/kg, reproducible probably due to the low amount of CaCO_3 in bricks), and by Leuchter's Sample No. 28 from Crematorium I, which he erroneously took from a wall which until 1944 belonged to the washroom, that is, it was *not* part of the alleged 'gas chamber' (1.3 mg/kg). In contrast, the residual quantities in the delousing barracks range from 1,000 to 10,000 mg/kg, meaning that 0.1 to 1% of the plasterwork in fact consists of cyanides (not the entire wall, though, since bricks are rather inert).

5.4. Interpreting the Results

5.4.1. My Interpretation

In view of these unambiguous results and of the fact that they cannot be explained away by any disintegration processes of iron blue, which remains stable for great periods of time, the question which needs to be addressed is how these results are to be interpreted scientifically.

First of all, one has to be careful when comparing the analyses results of samples taken from the delousing chambers with those taken from the alleged homicidal gas chamber. The reason for this is that especially in case of the delousing facilities several factors are unknown which can affect the interpretation of the results:

1. In case of the delousing chambers inside Buildings 5a and 5b it is not known how much time passed between the time when their walls were plastered and when they started being used for their purpose.
2. We therefore cannot determine with certainty: a) the exact humidity: and b) the alkalinity of the walls when the facilities started being operated.

20	Delousing Room B1b BW 5a, inside	Rudolf	7,850.0
22	Delousing Room B1b BW 5a, inside	Rudolf	4,530.0
1	Delousing Room B1b BW 5b, inside and outside	Ball	3,170.0
2	Delousing Room B1b BW 5a, inside and outside	Ball	2,780.0
28	Crematorium I, Washroom	Leuchter	1.3
	Crematorium II, Morgue #2 ('undressing room')	Mattogno	1.2
	Crematorium II, Morgue #2 ('undressing room')	Mattogno	1.3
5	Inmate barracks	Rudolf	0.8
6	Inmate barracks	Rudolf	<0.1
7	Inmate barracks	Rudolf	0.3
8	Inmate barracks	Rudolf	2.7/0.0
23	Inmate barracks	Rudolf	0.3
24	Inmate barracks	Rudolf	0.1
25	Untreated brick from random Bavarian farmhouse	Rudolf	9.6/9.6

Concentrations are in mg of cyanide (CN⁻) per kg of building material (brick, mortar, concrete, plaster). Cyanide values of less than 10 mg/kg are uncertain, samples returning values of less than 1-2 mg are considered cyanide-free. If two values are given, the second value gives the result of a control analysis performed by a different company.

- a. Single layer brick walls, as used in case of the delousing facilities inside Buildings 5a and 5b, normally are quite cold and thus wet in winter time. So, if these facilities went into operation in autumn or winter 1942 immediately after having been plastered, their walls certainly would have absorbed enormous amounts of HCN and probably converted it in the long run into long-term-stable iron-cyanide compounds already after the very first gassing (comparable with the quoted construction damage cases⁹⁷). Fortunately, we can compare the results of samples taken from an internal wall (Nos. 12 & 13) with those of external walls (9, 11, 20, 22) of the delousing facility inside Building 5a, which clearly shows that even dry and warm walls do form high amounts of iron-blue residues.
- b. Furthermore, having enormous problems with a raging typhus epidemic, the SS certainly did not wait for fighting the lice until the plaster of the recently finished delousing gas chambers was pH-neutral.

On the other hand, the features of the walls of the Morgue 1 of Crematorium II can more easily be determined:

1. We do know that, due to its chemical composition, the cement mortar used for plastering the underground morgues remains highly alkaline for many months.
2. We do know that this cement mortar has generally a considerably higher tendency to absorb gaseous and liquid compounds than lime mortar as used in the delousing facilities.¹⁴⁰
3. We do know that walls in unheated underground rooms are relatively cold and damp, which increases absorption of HCN enormously (an estimated average wall temperature of 10°C and a relative humidity of the air at around 100% is reasonable, increasing the absorption of HCN by around a factor of 8 compared to a wall at 20°C and 45% relative humidity).¹⁴¹

¹⁴⁰ That is due to its larger inner-surface area, *i.e.*, like a fine sponge (here cement mortar) can absorb more water than a coarse one (here lime mortar). W. Czernin, *Zementchemie für Bauingenieure*, Bauverlag, Wiesbaden 1977, pp. 49f. (English: *Cement Chemistry and Physics for Civil Engineers*, *ibid.*, 1980).

¹⁴¹ K. Wesche, *op. cit.* (note 93) Vol. 1, p. 37.

It is therefore reasonable to assume that the massively higher and longer-lasting tendency of the wet and cold cement mortar of the morgues of Crematoria II and III to form long-term-stable cyanide compounds could easily compensate for the somewhat shorter time it was exposed to the poisonous gas, if compared to the scenarios in the warm, dry and short-lasting alkaline internal walls of the delousing chambers.

It is therefore the conviction of the author that the high humidity, the relatively long lasting alkalinity of the cement plaster used in these mortuaries of Crematoria II and III, in combination with the realistic homicidal gassing scenarios (high HCN concentrations, slow ventilation process) would have led to the formation of long-term-stable cyanide compounds in a amount that should be easily detectable still today, not least because the conditions of these morgues were very similar to those described in one of the construction-damage cases referred to earlier,⁹⁷ which is quoted entirely and then analyzed in Appendix 1 of this volume.

5.3.2. Critique of Different Interpretations

There are several retorts to my findings by representatives of the orthodoxy which in my eyes are aiming with weak arguments at the wrong points.¹⁴² E.g., Bailer,^{15,22} Markiewicz *et al.*¹² and Clair²⁴ have claimed that no iron blue could form in brickwork as a consequence of exposure of walls to hydrogen cyanide. This has been sufficiently refuted.¹⁴³ Instead, they explain the blue color of the delousing-chamber walls as paint that was allegedly applied during or after the war. However, this hypothesis fails to explain the following facts:

- why only those chambers in Auschwitz, Birkenau, Majdanek and Stutthof (!) which were used for HCN fumigation have a patchy blue color (where nobody could admire it),¹⁰² while all other walls in all the camps were just painted with white lime paint;
- why the blue discoloration on the inside of the walls of Building 5a and on the bricks of the *outside walls* of both buildings is irregular and patchy – unless the painters painted the inside as well as the outside by throwing brushes and other paint-bearing objects at the walls instead of painting normally;
- why the stains on the inside of the exterior walls of Building 5a at times reveal the brick structure lying beneath the plaster – unless the painter had some x-ray eyes and was told to imitate that structure with the blue paint;
- why the inside dividing walls that were added to Building 5a after this facility was discontinued as a hydrogen-cyanide fumigation center are white and free of hydrogen-cyanide compounds – unless someone decreed that these walls should not be painted to match the splotchy appearance of the other walls;
- why the superficially white, iron-poor material of the walls of the disinfestation wing of Building 5b exhibit high cyanide concentrations – unless one posits that these rooms were painted with an “iron white,” a wall paint that does not even exist;
- why the deeper, subsurface(!) layers of the walls of the delousing chamber in Building 5b are a greenish blue, and saturated with cyanide compounds – unless for some inexplicable reason Iron Blue was added to the fresh mortar before being applied, although that would have decomposed the pigment, because it is not stable in fresh, alkaline mortar;
- why none of the colored walls shows any pattern of brush marks and also no identifiable coat of paint, since wall paint consists not only of pigment, but also of a considerable proportion of binding agents to hold the pigment in place and other chemicals. The blue pigment is, however, simply one component of the lime paint and plaster.

The fact is that the walls of the delousing buildings are saturated clean through with hydrogen-cyanide compounds, of which only a part becomes visible as iron blue, predominantly in damp areas and at the surfaces due to accumulation processes. These facts can be explained only as a result of fumigations with HCN.

Another attempt at explaining the difference of the results between alleged execution ‘gas chambers’ and delousing chambers was somewhat more complicated. As mentioned before, humans are more sensitive to HCN than are insects. Proponents of the orthodox Holocaust narrative argue that the execution gassings were performed using only very little hydrogen

¹⁴² For a more detailed discussion see G. Rudolf, *The Chemistry...*, *op. cit.* (note 26), pp. 336-359.

¹⁴³ See Section 3.3.1. and in more detail in G. Rudolf, *ibid.*, pp. 181-184, 190-226.

cyanide, and that they did not take nearly as long as the delousing fumigations of material objects, which often took many hours.¹⁴⁴ These two factors – low concentrations of HCN and shorter fumigation times – were the reason for the fact that no residues could form.^{11,14-16,145}

If one recalls my previous findings regarding the quantities allegedly used (similar to, or even more than those for delousing fumigations) and the problems of ventilation, which would have taken hours, if not days, then it is quite clear that this assumption needs wrong premises. The results of the chemical analyses can therefore not be explained in this way.

G. Wellers posited that the victims had absorbed all the hydrogen cyanide by respiration.¹⁶ Considering the huge amounts of Zyklon B required to effect the swift executions claimed, this theory is simply absurd.

Ignoring the scientific facts as summarized here in Section 3.3.2., Markiewicz *et al.*¹² and van Pelt¹⁴⁶ have wrongly claimed that iron blue would disappear when exposed to environmental conditions.

Prof. James Roth from the Alpha Analytic Laboratories, Ashland, Massachusetts, added a particularly sad chapter to this discussion. In 1988, Roth's laboratory had analyzed the masonry samples taken by Leuchter in Auschwitz for their cyanide content. During the trial against Ernst Zündel in Toronto that same year, Prof. Dr. Roth himself was interrogated as an expert witness. Ten years later, US filmmaker Errol Morris interviewed Roth about this event.¹⁴⁷ This interview was then quoted by Dr. Robert van Pelt in his 1999 expert report prepared for the libel case of British historian David Irving against Deborah E. Lipstadt. In it, van Pelt wrote about Roth's statements in Morris's movie:¹⁴⁸

"Roth explained that cyanide will react on the surface of brick or plaster, penetrating the material not more than 10 microns, or 0.01 mm, or one tenth the thickness of a human hair [...]. In other words, if one wants to analyze the cyanide concentration in a brick sample, one should take a representative sample of the surface, 10 microns thick, and no more."

This is utter nonsense, and Dr. Roth knew this very well. Here are the reasons:¹⁴⁹

1. The analytical results of my samples prove that the walls of the disinfection chambers in Birkenau are saturated with cyanide compounds not just superficially, but into the depth of the masonry.
2. Expert literature is detailed in that hydrogen cyanide is an extremely mobile chemical compound that can easily penetrate thick, porous layers like walls.¹⁵⁰
3. It is generally known that cement and lime mortar are highly porous materials, comparable for instance with sponges.¹⁵¹ In such materials, no defined layer of 0.01 mm exists beyond which hydrogen cyanide could not diffuse.

¹⁴⁴ A. Breitwieser, Head of the Inmate Clothing Depot in Auschwitz, tells of round-the-clock fumigations at the *Deutsche Ausrüstungswerke* (German Equipment Works, an SS-owned company staffed with Auschwitz inmates), H. Langbein, *Der Auschwitz-Prozeß*, Europäische Verlagsanstalt, Frankfurt/Main 1965, p. 786.

¹⁴⁵ R.J. van Pelt, *Pelt Report*, *op. cit.* (note 54), p. 298, who is otherwise merely parroting what others have said, especially Markiewicz *et al.*, *op. cit.* (note 12, 1994).

¹⁴⁶ *Ibid.*, p. 306.

¹⁴⁷ Errol Morris, *Mr. Death: The Rise and Fall of Fred A. Leuchter, Jr.*, Fourth Floor Productions, May 12, 1999; VHS: Universal Studios 2001; DVD: Lions Gate Home Entertainment, 2003; <https://youtu.be/YOqhuDGCC04>.

¹⁴⁸ *Pelt Report*, *op. cit.* (note 54), p. 307. Also in van Pelt's book, *op. cit.* (note 27), p. 390. This claim played a role in the verdict which should not be underestimated, cf. Charles Gray, verdict in court case of note 54; www.hdot.org/judge_toc/, §13.79

¹⁴⁹ For more details see Section 8.4.3. in G. Rudolf, *The Chemistry...*, *op. cit.* (note 26), pp. 344-347.

¹⁵⁰ W. Braker, A. L. Mossman, *Matheson Gas Data Book*, Matheson Gas Products, East Rutherford 1971, p. 301; see in particular the actual tests of this penetrating power through masonry by L. Schwarz, W. Deckert, *op. cit.* (note 94).

¹⁵¹ DIN 4108, Parts 3 to 5, deals with diffusion of steam into building materials. The most important coefficient for building materials is the so-called coefficient of diffusion resistance; this is a dimensionless number indicating how much longer the diffusion of steam takes to penetrate a layer of certain materials compared to the time it takes to diffuse through the same layer of still air. This coefficient is valid not only for water vapor, but also for gaseous hydrogen cyanide as well as for any other gas. In the list of

4. Finally, the massive discolorations of the *outside* walls of the disinfestation chambers in Birkenau and Stutthof are clearly visible and conclusive evidence for the fact how easily hydrogen cyanide and its soluble derivatives can penetrate such walls.

Prof. Roth knew that his statement in the Morris interview was wrong, because during his testimony under oath as an expert witness during the above mentioned Zündel Trial he correctly stated:¹⁵²

“In porous materials such as brick or mortar, the Prussian blue [recte: hydrogen cyanide] could go fairly deep as long as the surface stayed open, but as the Prussian blue formed, it was possible that it would seal the porous material and stop the penetration.”

It is also revealing that Prof. Roth mentioned during this interview, if he had known where Leuchter’s samples originated from, his analytical results would have been different.¹⁵³ Such an attitude is exactly the reason why one should never tell an ‘independent’ laboratory about the origin of the samples to be analyzed.

Another strange story is that of Richard Green, a PhD Chemist with quite similar educational background as I have.²⁵ The layman would expect two experts with similar educational backgrounds to come to similar conclusions in questions relating to their expert knowledge. But this is only partly the case. The reason for this is that Dr. Green ignores many facts that are either supported by documental evidence – like the performance of the ventilation installed in Crematoria II and III, or the speed of executions in U.S. execution chambers – or by expert literature – like the higher tendency of cold, moist walls to adsorb HCN, and the longer lasting alkalinity of cement mortar compared to lime mortar.

However, Dr. Green makes some concessions which are important to note:

- a. He agrees that basically all witnesses attest to very short execution times, indicating a rather high concentration of HCN used.
- b. He also agrees “that Rudolf is correct or nearly correct regarding the formation of blue staining in the delousing chambers.”

What he does challenge, though, is the possibility of formation of any noticeable quantities of Iron Blue in the homicidal ‘gas chambers.’ One of his flawed and deficient arguments to support his thesis is that in his view, no noticeable amounts of cyanide could have accumulated in the walls of the morgues (‘gas chambers’). According to Dr. Green, one major factor for this is supposed to be the fact that masonry has a neutral pH value which prevents the formation of cyanide salts. But if that were true, how come huge amounts of cyanides did accumulate in the walls of the disinfestation chambers?

My argument in this regard is that particularly cement plasters and concretes, as used in Morgues 1 of Crematoria II and III, are noticeably alkaline for many weeks, months, or even years, which I documented thoroughly with expert literature on the chemistry of building materials.¹⁵⁴ Hence, I concluded that these walls would have been very much inclined to accumulate cyanide salts and to form Iron Blue, even more so than the lime plaster of the disinfestation chambers, which in turn provoked the following answer by Dr. Green:¹⁵⁵

100 different building materials compiled in DIN 4108 part 4, one can find lime and cement mortar with diffusion resistances from 15 to 35, in which case the resistance grows with increasing cement content, for gypsum plaster, the coefficient is 10, for brick walls 5 to 10, for glass wool mats it is 1. That means, if a gas diffuses through a layer of still air with a speed of 1 cm per second, it takes 15 to 35 seconds to diffuse through a 1 cm thick layer of lime or cement mortar and 5 to 10 seconds to diffuse just as deep into a brick wall. (I am grateful to Mr. C.H. Christmann for this reference.)

¹⁵² B. Kulaszka (ed.), *op. cit.* (note 5), p. 388 (protocol p. 33-9291).

¹⁵³ This passage of the interview was excised from the commercial version of Morris’s movie; cf. the statement by D. Irving during his court case against D. Lipstadt (note 54), Day 8, transcript p. 61; www.hdot.org/day08.

¹⁵⁴ See Section 6.7.2. of *The Chemistry...*, *op. cit.* (note 26), pp. 217-220.

¹⁵⁵ R.J. Green, J. McCarthy, “Chemistry is not the Science,” *op. cit.* (note 25); repeated in Richard J. Green, “Report of Richard J. Green,” introduced in evidence during the appeals procedure of the trial of Irving v. Lipstadt (note 54), 2001, p. 50, again without any attempt to address the issue raised by recourse to expert literature; <http://phdn.org/archives/holocaust-history.org/irving-david/rudolf/affweb.pdf>.

"[In 1993] *The IFRC* [Institute for Forensic Research, Krakow], *on the other hand measured the pH* [of mortar samples from the alleged gas chambers] *to be between 6 and 7* [i.e. neutral]."

Dr. Green obviously did not consult any literature on the chemistry of building materials, as he quotes none. He solely relies on the findings of the Krakow institute. In order to make the reader see how flawed Dr. Green's way of arguing is, let me say it in a parable:

By referring to a couple of Italian expert pizza baking instructions, I showed that a pizza, when taken out of the oven, is hot or warm for quite a while (one hour). Now, Dr. Green comes along claiming that I am wrong because a Polish friend of his has just now measured the temperature of a pizza which was baked a week ago, and which has been lying around somewhere since. And the Polish scientists found out that this pizza is indeed cold right now. Surprise, surprise!

Of course, samples taken from the surface of walls erected 50 years ago or more are now pH neutral! I documented this as well by referring to a PhD thesis showing how the front of neutralization slowly migrates into concrete and mortar.¹⁵⁶ So what does the pH value of samples taken 50 years after the erection of these buildings prove regarding their pH value shortly after they were built? Dr. Green's way of arguing is puerile in the highest degree.

In a desperate attempt to defend the claim that the blue stains in the disinfestation chambers are not the results of exposure to hydrogen cyanide, Dr. Green topped off his puerility by hypothesizing that these stains instead were the results of items "soaked with aqueous solutions of HCN" having leaned against these walls.¹⁵⁷ And in this way he seeks to explain that the blue stains are everywhere on the wall, from the floor to the ceiling, and all the way through the wall to the outside? I won't waste more ink on this "Dr."

5.4. A Serious Attempt at Deception

Many people, both experts and laymen, rely complacently upon the findings of the Jan Sehn Institute for Forensic Research in Krakow, *i.e.*, the study published in 1994 by Prof. Markiewicz and colleagues. These scientists, however, tested their samples with an analytical method that was unable to detect stable iron-cyanide compounds like Iron Blue. They did this because they claimed to be unable to imagine how such stable iron-cyanide compounds could form:¹⁵⁸

"It is hard to imagine the chemical reactions and physicochemical processes that could have led to the formation of Prussian blue [= iron blue, G.R.] in that place."

Has anyone ever heard that not understanding a phenomenon is a reason for a scientist not to examine it? For these Poles it obviously was. And even more: They did not even try to refute the theory I presented in one of my publications of spring 1993.¹⁵⁹ They knew of this publication, since they quoted it, but only as an example of the alleged evil deeds of the deniers and whitewashers of Hitler, whom they intend to discredit. That should be enough to show that the intention of these Poles was highly ideologically biased. If they were neutral scientists, they would not care about the dirtiness of Hitler's laundry.

Moreover, they did not even make an attempt to explain what might be responsible for the high iron-cyanide content of the wall's plaster, the inner mortar, and even the outside bricks as well as their patchy blue coloring – in the absence of any coat of paint.

Even though they had tampered with the analysis method, when testing their first series of samples, it turned out that only one sample taken from an alleged homicidal 'gas chamber' had minimal cyanide residues, in contrast to the samples taken from a delousing chamber. Hence, the Poles suppressed these findings¹⁶⁰ and took more samples, until they found what they were looking for. This time, the samples from both the delousing chambers and the alleged homicidal 'gas chambers' showed extremely low but comparable amounts of unsta-

¹⁶⁰ The first paper of J. Markiewicz, W. Gubala, J. Labedz, B. Trzcinska, was never published by themselves, but only by revisionists, as this paper leaked out of the Jan Sehn Institute in 1991; see note 12f.

Table 4: Orders of magnitude of analytical results of various samples, in mg CN⁻/kg

Author:	Markiewicz <i>et al.</i>	Leuchter	Rudolf	Ball
Detection of:	Cyanide without Iron Blue	————— Total Cyanide —————		
delousing chambers	0 – 0.9	1,025	1,000 – 13,000	2,780 – 3,170
“gas chambers”	0 – 0.6	0 – 8	0 – 7	0 – 1.2

ble cyanide residues (or maybe just lots of carbonate mimicking the presence of cyanide). But at least they, too, established that wet cement mortar absorbs much more than ten times as much HCN as dry lime mortar does, as I assumed in my extrapolations. In the following table, I compare the results as obtained by Jan Markiewicz and colleagues on the one hand, and by Fred Leuchter, John Ball and me on the other:

Even after confronting them with my arguments about their work,¹³ these Poles refused to give any explanation for their unscientific behavior. Dr. Markiewicz died in 1997. The remaining two co-authors, W. Gubala and J. Labedz, have always been silent about this.

It is also indicative that these Polish authors have an ardent supporter in Dr. Green. Although Dr. Green agrees with me that the Iron Blue found in delousing chambers could be the result of gassings with hydrogen cyanide, he refuses to acknowledge that the approach of the Krakow team to exclude Iron Blue from the analysis was fraudulent. No matter which results the Polish scientists produced and what their scientific opinion might have been: their behavior is extremely antiscientific, as **the most important task of a scientist is to try to understand what has not been understood so far, and to discuss the attempts of others to make it understandable**. The Polish scientists did just the opposite: they decided to ignore and exclude what they claimed not to understand.

The behavioral pattern exhibited by these Polish scientists – and of everyone relying on them – is not new. In fact, it is the same pattern as shown by the Pope’s Holy Inquisitor Cremonini when he refused to look through Galileo’s telescope to see Jupiter’s moons revolving around Jupiter, because he could not – or did not want to – understand what Galileo was saying – since he did not like the consequences for his worldview, which is: if moons revolve around Jupiter, then our Earth might revolve around the sun. Markiewicz, Dr. Green, and van Pelt do the same thing: They refuse to use a ‘telescope’ that enables them to see iron blue ‘revolving around the delousing chambers,’ because they do not like the impact this has on their worldview: if iron blue ‘revolves around the delousing chambers,’ then iron blue might be expected to ‘revolve around homicidal gas chambers’ as well. And they do not like that at all, because the lack of iron blue in these locations opens up doubts about the reality of the claimed homicidal gas chambers.

On closer inspection, the only ‘scientific’ attempt to refute Fred Leuchter’s most-intriguing thesis therefore turns out to be a simple scientific fraud. How desperate must those be who try to defend the orthodox Holocaust narrative that they resort to such obviously fraudulent methods?

5.5. The Limits of the Chemical Method

During the first decades after the war, it was quite common for “eyewitnesses” to speak of daily, even of continual homicidal gassings at Auschwitz,¹⁶¹ but ever since the Eastern Bloc collapsed in the early 1990s, the subsequent drastic reductions in the claimed numbers of gassing victims (first to roughly a million, then to 630,000, to some 500,000, or even to 356,000)¹¹⁸ have resulted in revised assumptions of considerably fewer gassings per ‘gas chamber.’

Some orthodox scholars moreover claim that only very small quantities of hydrogen cyanide were allegedly used, and others point out that the walls of the ‘gas chambers’ were allegedly hosed down with water after each gassing, even though the witnesses they can quote for this:

¹⁶¹ E.g., the testimony of Milton Buki in the Frankfurt Auschwitz Trial, H. Langbein, *Der Auschwitz-Prozess*, Europäische Verlagsanstalt, Frankfurt/Main 1965, p. 96.

a) merely spoke of the corpses being hosed down, not the walls; and b) these witnesses have lost all credibility in the face of revisionist criticism.¹⁶²

Taking all these made-up constraints into consideration – although they fly in the face of the only evidence we have – it would be possible to arrive at a point where the concentration of hydrogen cyanide getting in contact with the cool and damp walls of Morgues 1 of Crematoria II and III would have been so low, and the duration of this exposure so short that even a vague prediction of the results yielded by chemical analyses would no longer be possible.

All this is conceivable only because the orthodoxy turns a blind eye to the evidence demonstrating that Crematoria II and III had no holes through which the Zyklon B could have been introduced, and that no Zyklon B could have been introduced into the claimed 'gas chambers' of Crematoria IV and V either, because their hatches were closed off with iron bars. But do orthodox scholars care about facts? They evidently have their ironclad opinion, which they don't want to see shaken by facts.

While chemistry is an exact science, the results of chemical analysis aren't always exact, nor is their interpretation always straightforward. In the present case, there are many variables that need to be considered when interpreting the results of chemical analyses. These results do not give a definite, unimpeachable answer to the questions whether or not homicidal gassings took place in Auschwitz and Birkenau, but they suggest a high probability that the eyewitness statements about mass gassings are false.

6. Conclusions

Facing the revisionist challenge, the orthodoxy tampers with the evidence in order to maintain their narrative. They cherry-pick witness testimony to suit their purpose, ignore those that are obviously impossible or even embarrassingly ludicrous, misinterpret existing documents by ripping quotes out of their context or outright fabricating contents they don't have, and they intentionally use crippled forensic methods that amount to fraud.

Examining the design of the facilities allegedly used for the mass gassings has shown that the alleged main 'gas chambers' of Auschwitz – the morgue of the Main Camp crematorium, the Morgues 1 of Crematoria II and III, and the rooms equipped with hatches in Crematoria IV and V – had no way of introducing Zyklon B as claimed in testimonies. This alone renders any mass gassings, as these have been attested to, entirely impossible.

The examination of the formation and long-term stability of hydrogen-cyanide residue in the walls of the facilities in question ('gas chambers' and delousing chambers for material objects), as well as the interpretation of the results of analyses of masonry samples from these facilities in Auschwitz, have shown:

1. Hydrogen cyanide reacts in masonry by forming iron blue. This pigment remains stable for centuries. Its disintegration requires a time frame similar to that of the masonry itself. Therefore, cyanide residue – if formed during the war – would have been detectable in the 1990s when several authors drew samples from the facilities in question, regardless of weathering effects. The outside walls of the disinfestation wings of the

¹⁶² For instance, Miklós Nyiszli claimed: "The Sonderkommando group stands around the mountain of corpses in tall rubber boots and flushes it with powerful streams of water. There is great need of this, for the last act of death by asphyxiation, and thus death by gas, is the release of excrement from the bowels. All of the dead are filthy with it!," C. Mattogno, M. Nyiszli, *An Auschwitz Doctor's Eyewitness Account: The Bestselling Tall Tales of Dr. Mengele's Assistant Analyzed*, 2nd ed., Castle Hill Publishers, Uckfield 2020, p. 41; Mattogno demonstrates in this book what an unashamed liar and impostor Nyiszli was. Filip Müller, who plagiarized Nyiszli's book and added his own mendacious yarn to the tale (see C. Mattogno, "Auschwitz: A Case of Plagiarism," *JHR*, 10(1) (1990), pp. 5-24; *idem*, *Sonderkommando Auschwitz I*, Castle Hill Publishers, Uckfield, 2021, pp. 13-131), wrote: "When some room had been made behind the door, the corpses were hosed down. This served to neutralize any gas crystals still lying about, but mainly it was intended to clean the dead bodies. For almost all of them were wet with sweat and urine, filthy with blood and excrement, while the legs of many women were streaked with menstrual blood." *Auschwitz Inferno: The Testimony of a Sonderkommando*, Routledge & Kegan Paul, London 1979, p. 117. This hosing down of the corpses would have made the 'gas-chamber' walls even more wet and more susceptible to accumulate hydrogen cyanide during the next gassing, so that argument actually backfires on the orthodoxy.

Buildings 5a/b in Birkenau, which are still blue on their outer surfaces today, as well as being high in cyanide content, prove this, among other things.

2. In the rooms in question, and under such conditions as would have been possible, the attested-to mass gassings with hydrogen cyanide would have resulted in the formation of cyanide residues on a similar scale as is the case in the disinfestation chambers, including the resultant blue discoloration of the walls.
3. In fact, however, the alleged 'gas chambers' exhibit only insignificant, non-reproducible traces of cyanide residues on the same order of magnitude as can be found in any other building.

The only possible conclusion that can explain all phenomena and factors involved is that, in the facilities alleged, no mass gassings with Zyklon B can have occurred under the conditions attested to by the witnesses.

The Cremation Furnaces of Auschwitz

CARLO MATTOGNO AND FRANCO DEANA

1. Preliminary Remarks

The first version of this contribution was originally written in 1993 when I had just started collecting source material on cremation technology in general and on the cremation furnaces installed at Auschwitz in particular. Over the subsequent 15 years, my historical as well as technical knowledge of this topic has increased to such an extent that the English edition of my study on the cremation furnaces of Auschwitz, which appeared in 2015, was split into three volumes, the first consisting of the text (480 pages), the second of a collection of documents (300 documents, 476 pages), and the third of 364 color and 22 black-and-white photos (242 pages).¹ The following paper is still based on my initial 1993 article, but it has been updated to incorporate the knowledge gained through the years. The brief chapter on the cremation pits of Auschwitz would also require a radical revision as a result of new knowledge, but the topic itself is too complex to be summarized in just a few pages. The interested reader may instead consult a monograph I have written on that topic.² I therefore kept that chapter as it was, even though I am quite aware of its deficiencies. Although I have authored the present article, the late Dr. Ing. Franco Deana should really be considered a co-author, because the precious assistance he has always given me throughout the years must be recognized.

Carlo Mattogno

2. Introduction

If a monstrous extermination of many hundreds of thousands of people took place in gas chambers at Auschwitz and Birkenau during the Second World War, and if the bodies of most of these victims were disposed of in the cremation facilities in those camps, then the ‘murder weapon’ – the homicidal gas chamber – has an essential counterpart: the cremation furnace.

‘Eyewitnesses’ have tried to persuade us that the cremation furnaces of Auschwitz and Birkenau were satanic contraptions operating far outside the realm of physical laws,³ not ordinary cremation facilities subject to the same laws of chemistry, physics and heat engineering as all other such devices. Historians have chosen to trust blindly in these witnesses, and in the process have let themselves get carried away into making entirely erroneous claims.⁴

Aside from the revisionists, Jean-Claude Pressac is the only researcher to have approached the historical problem of the cremation of bodies in Auschwitz and Birkenau from a tech-

¹ *I forni crematori di Auschwitz: Studio storico-tecnico*, 2 Vols., Effepi, Genoa 2011; English: *The Cremation Furnaces of Auschwitz: A Technical and Historical Study*, 3 Vols., Castle Hill Publishers, 2nd ed., Uckfield 2021; if quoted, page numbers refer to the English edition.

² Carlo Mattogno, *Auschwitz: Open-Air Incinerations*, 2nd ed., Castle Hill Publishers, Uckfield 2016.

³ We limit ourselves to just one representative example: Miklós Nyiszli sets the daily cremation capacity of the crematoria of Birkenau at 20,000! M. Nyiszli, *Boncolórvósa voltam az Auschwitz-i krematóriumban*, Világ, Debrecen 1946, p. 38; cf. C. Mattogno, M. Nyiszli, *An Auschwitz Doctor’s Eyewitness Account: The Bestselling Tall Tales of Dr. Mengele’s Assistant Analyzed*, 2nd ed., Castle Hill Publishers, Uckfield 2020, p. 43; cf. pp. 199f.

⁴ In 1992, Franciszek Piper, at that time director of historical research at the Auschwitz Museum, claimed that the “factual capacity” of the four Birkenau crematoria had been “up to 8,000 bodies per day.” He based his assertion on the eyewitness testimony of Alter Feinsilber (aka Stanislaw Jankowski, Stanislaw Kaskowiak Alter Szmul Fajnzylberg): F. Piper, *Auschwitz. Wielec Juden, Polen, Zigeuner... wurden umgebracht*, Universitas, Krakow 1992, p. 21.

nical perspective.⁵ In his book *Auschwitz: Technique and Operation of the Gas Chambers* he comes to the following conclusions:

- The three double-muffle furnaces in Crematorium I of the Auschwitz Main Camp had a capacity of 340 cremations in a 24-hour period.⁶ In 1993, he reduced this figure down to 200-250 per day.⁷
- The five triple-muffle furnaces in Crematoria II and III at Birkenau each had a maximum capacity of between 1,000 and 1,500 cremations per 24 hours,⁸ but their normal capacity was 1,000 to 1,100 cremations each per 24 hours.⁹ In 1993, he reduced this figure down to 800-1,000 per day.¹⁰
- The two eight-muffle furnaces of Crematoria IV and V each had a capacity of 500 cremations per 24 hours.¹¹

Pressac thus puts the total capacity of the crematoria of Auschwitz and Birkenau at 3,540 cremations per day. From a technical perspective, this figure is completely unrealistic.¹²

Among the revisionists, it was particularly Fred A. Leuchter who, in his well-known *Leuchter Report*,¹³ turned his attention to the issue of the cremations. Relying primarily on the statements of Ivan Lagacé, the manager and operator of the Bow Valley Crematorium in Calgary, Canada,¹⁴ Leuchter erroneously arrived at a figure of 156 bodies per day as the total cremation capacity of the crematoria of Auschwitz and Birkenau. This figure is actually far below the actual capacity.

Pressac and Leuchter arrived at conclusions which, though diametrically opposed, are equally unfounded because no serious studies on the fundamental issue of the cremation furnaces at Auschwitz and Birkenau existed back then, neither by any orthodox nor any revisionist scholar. We have closed this debilitating gap with our three-volume study on the cremation furnaces of Auschwitz, the essential parts of which will be summarized in this contribution.

⁵ I ignore here the incompetent elaborations of professor of accounting(!) John C. Zimmerman in his book *Holocaust Denial: Demographics, Testimonies and Ideologies*, University Press of America, Lanham/New York/Oxford 2000; the section addressing cremation technologies were culled from parts of two internet articles which I have debunked elsewhere: "An Accountant Poses as Cremation Expert," in: G. Rudolf, C. Mattogno, *Auschwitz Lies: Legends, Lies, and Prejudices on the Holocaust*, 4th ed., Castle Hill Publishers, Uckfield 2017, pp. 89-197.

¹² Werner Wegner has devoted considerably more care to this problem than Pressac has, but the results of his study, which was published in very brief summary form, are even less well-founded in technical respects than the French historian's. Wegner writes that in the Birkenau crematoria it was possible to cremate three bodies in one muffle within half an hour, which would have amounted to a capacity of 6,624 bodies per 24-hour period: W. Wegner, "Keine Vergasungen in Auschwitz? Zur Kritik des Leuchter-Gutachtens," in U. Backes, E. Jesse, R. Zitelmann (eds.), *Schatten der Vergangenheit: Impulse zur Historisierung des Nationalsozialismus*, Ullstein-Propyläen, Frankfurt/M., Berlin 1990, p. 460. Another superficial study of this topic was published by Fritjof Meyer in 2002: "Die Zahl der Opfer von Auschwitz," *Osteuropa*, 52(5) (2002), pp. 631-641 (English online: www.vho.org/GB/c/Meyer.html); see Carlo Mattogno, "Auschwitz. The New Revisions by Fritjof Meyer," *The Revisionist*, 1(1) (2003), pp. 30-37.

3. Modern-Day Cremation

3.1. The Technology of Cremation Furnaces up to World War One

The cremation of dead bodies was practiced in Europe for more than a thousand years before Homer's time.¹⁵ This custom was carried on until 785 AD, when Charlemagne forbade it, on pain of death, in his Decree of Paderborn.¹⁶ In the following centuries, cremation disappeared entirely from Christian Europe.

The idea of cremation regained some popularity during the French Revolution, but only in the second half of the 19th Century did it gradually find general acceptance.¹⁷ The trend favoring cremation began to gain momentum only in 1849, when philologist Jakob Grimm gave a memorable lecture "on the cremation of corpses"¹⁸ at the Berlin Academy of Sciences. The idea was quickly picked up by eager pioneers, and enthusiastically promoted.¹⁹ The first cremation in a cremation furnace in Europe took place on October 9, 1874 in Dresden in a makeshift furnace designed by Friedrich Siemens. After a few cremations, this experimental procedure was banned by the Saxon government.²⁰

In those years, Italy was leading this modern movement for cremation, both legally and technologically. The first European crematorium was built in Milan in 1875, one year after cremation was recognized as a legal method for the disposal of the dead.²¹ The first German crematorium was put into operation in Gotha on December 10, 1878. This period saw a great fervor of studies and experiments that led to the construction of several types of furnaces. Modern cremation had to satisfy certain ethical, aesthetic and economic requirements, which were defined during a general conference on cremation technology held on June 7, 1876 in Dresden.

Many cremation facilities of the 1870s were as yet very unreliable and costly to operate – some had cremation times of up to five to six hours per corpse –, so that some were usually dismantled after just a few cremations. But much better capacities and fuel efficiencies were soon reached: The Gorini furnace at Riolo, for instance, which started operation on September 6, 1877, needed only 100-150 kg (220-330 lbs.) of coke and 1.5-2 hours per corpse. The furnace by Toisoul and Fradet needed ca. 100 kg and just one hour per corpse.²² In these

furnaces, the body was directly exposed to the flames, which were produced either by the incineration of the fuel or by combustion of the fuel gases from a gas generator.

A principle devised by Friedrich Siemens introduced the process of wholly indirect cremation using heated air, allowing only hot air but no flame gases to reach the body. This method dominated unchallenged in Germany until 1924. In this new procedure, cremation was performed by means of air heated to 1000°C (1830°F) in a regenerator or recuperator.²³ The experimental prototype of such a furnace was installed in 1878 in Gotha and was used for the cremation of animal carcasses only. A cremation took 135 minutes on average; the first cremation required 1,500 kg (3,300 lbs.) of brown coal (lignite), subsequent ones took from 250 to 300 kg (550 to 660 lbs.) or less, with the requirements decreasing step by step.²⁴

The Swedish Klingenstierna furnace was a distinct improvement over the Siemens furnace. Besides a main firing, it had an auxiliary firing that served mostly the post-combustion of the smoke gases; the combustion air fed into the furnace was heated in a recuperator consisting of metal pipes (heat exchanger between the furnace gas and the combustion air). The body was introduced into the incineration chamber on a small cart that remained there for the entire duration of the cremation cycle. In Germany, this system was perfected by E. Dorovius, and built by the Gebrüder Beck Company in Offenbach. The first models, which were installed in the crematoria of Heidelberg (1891) and Jena (1898), still had the corpse-introduction cart, but the 1899 model (Offenbach Crematorium) worked without a cart, and the floor of the incineration chamber was replaced by a refractory grate, beneath which two sloping surfaces, angled like a funnel, channeled the ash into the ash pit.²⁵ The metal recuperator was gradually replaced by one made of refractory brick, and the furnace took on the typical design of the German cremation furnaces with coke-fired gas generator.

A prototype of the Schneider furnace was installed in the crematorium of Hamburg in 1892. Its structure was similar to that of the Klingenstierna-Beck furnace with some improvements to the gas generator. It took approximately three hours to get this furnace to an operational temperature. The duration of a single cremation was between 45 and 90 minutes, with a coke consumption of 250-300 kg (550-660 lbs.) for the first and 50-100 kg (110-220 lbs.) for subsequent cremations. The Ruppmann furnace had already the typical structure of a modern coke-fired cremation furnace.²⁶ According to experimental data taken at the crematorium of Stuttgart during 48 cremations between July 20 and September 15, 1909, a cremation lasted on average 1 h 33 min, with a minimum of 1 h 10 min and a maximum of 2 h 30 min.²⁷

The furnace designed by the Swedish firm Knös introduced some more improvements to the Klingenstierna-Beck system. Its coke consumption for the pre-heating and the first incineration was 300 kg, and 50-90 kg for each subsequent cremation. In Germany, the company Gebrüder Beck of Offenbach produced this furnace under a license contract.

3.2. Technological Progress and Developments in the Inter-War Years

After the First World War, the peace dictate of Versailles forced Germany to give up coal-rich regions as well as to supply coal to the victorious powers. Hence, Germany saw herself forced to use the coal reserves left to her as efficiently as possible. For these reasons, German industry endeavored to redesign, in terms of heat engineering, all facilities consuming coal and coal products so as to maximize the return achieved per unit of fuel consumption.

Cremation furnaces and their operation were by no means exempt from this need for the thrifty use of coal. Consequently, a Prussian law dating from September 14, 1911 was amended in 1924. This law had permitted only the wholly indirect cremation of bodies, for aesthetic reasons, but this process required more time and fuel than its alternative.²⁸ The debate about this amendment was accompanied by at-times-heated arguments among the cremation experts, disputing which of the two methods was the more economical one.²⁹ This question could be resolved only by means of scientific cremation experiments. The most-significant experiments of this period were carried out in 1926 and 1927 in the crematorium of Dessau by Engineer Richard Kessler, who wrote a detailed scientific report on their results.³⁰ In the following, we will examine the results of these experiments.

The design of new furnaces took into account the decisive factors involved in the optimum use of combustion heat that Engineer Kessler had discovered in his experiments. As a result, the efficiency of the furnaces increased considerably. The most-important technological innovations of that time include the reduction of the horizontal cross-section of the gas generator; more-efficient recuperators; the installation of an afterburning grate; an air-intake system to allow for more-efficient afterburning; and the installation of appropriate measuring instruments.³¹

In the early 1930s, the coke-fired furnaces with gas generator had reached the pinnacle of technological perfection, yet at the same time their inexorable decline began as they were being increasingly replaced by significantly more-economical heating systems, particularly those using gas or electricity. From this point on, the existing coke-fired furnaces were either replaced³² or restructured to accommodate gas heating.³³ The new heating systems necessi-

tated additional studies on the structure of the furnaces as well as on the phenomenon of cremation *per se*, and these studies were presented in significant technical publications.³⁴

Even though the first German crematorium had already been built in 1878, cremation was not legally permitted until 1911, and it took until the 1930s before uniform legislation on this matter was enacted. The first real and complete Cremation Act was passed on March 15, 1934. Specific decrees pertaining to the cremation furnaces and the cremation process followed soon thereafter.³⁵

As the following table shows, the number of cremations in Germany rose astronomically between the time when the first crematorium was opened, and the beginning of the Second World War:³⁶

PERIOD	# OF CREMATORIA	# OF CREMATIONS	ANNUAL AVERAGE # OF CREMATIONS
1878-1887	1	496	50
1888-1897	2	2,192	219
1898-1907	15	12,382	1,238
1908-1917	51	88,687	8,869
1918-1927	81	283,976	28,398
1928-1937	118	628,600	62,860

In 1938, 84,634 cremations were performed in 120 crematoria;³⁷ in 1939, there were 102,112 cremations; in 1940, 108,130; in 1941, 107,103; and in 1942, 114,184.³⁸

3.3. J. A. Topf & Söhne, Erfurt

Regarding cremation furnaces, the company J.A. Topf & Sons of Erfurt began manufacturing operations at the start of the First World War,³⁹ and was most notably successful in the early 1920s. Their early models pioneered several innovations, particularly a system of exterior muffle heating.⁴⁰ This prevented the combustion products from entering the muffle, thus allowing for an entirely indirect cremation process.

This cremation furnace consisted of a coke-fired gas generator; a self-contained cremation chamber (muffle); a system of channels underneath (recuperator), which served to preheat the air required for the cremation; and the diversion of the carbon-monoxide gases around

the muffle.⁴¹ The Topf furnaces built during the 1920s needed 60 to 75 minutes per cremation, and consumed some 160 to 260 kg (350 to 570 lbs.) of coke per cremation.⁴²

During the 1920s, J. A. Topf & Sons became Germany's foremost commercial cremation-furnace manufacturer. Between 1922 and 1927, no less than 18 of the 24 furnaces installed in German crematoria were built by Topf.⁴³ In the early 1930s, Topf's commercial supremacy was consolidated.⁴⁴ By then, Topf & Sons had achieved a very advanced technological level. They deserve the credit for designing Germany's first fully functional gas-heated cremation furnace (1927, in Dresden), as well as the country's first electric cremation furnace, which came into service in Erfurt in 1933. The firm also pioneered improvements in cremation technology such as the afterburning grate and the rotating grate.

Even though the electric Topf furnaces had no competition in Germany, the company's supremacy in the furnace-manufacturing field was seriously threatened in those years by the newly developed gas furnace of the Volckmann-Ludwig type.⁴⁵ In technological respects, the Topf Company responded to the competition posed by the new furnace by designing a Model-1934 gas furnace.⁴⁶ In propagandistic terms, they responded with rather harsh polemics in the form of a most aggressive article by Engineer Kurt Prüfer,⁴⁷ the man who would design the three- and eight-muffle furnaces of Birkenau; the criticism advanced in that article, however, was refuted by Richard Kessler.⁴⁸

3.4. Structure and Operation of Coke-Fired Cremation Furnaces of the 1930s

This type of furnace consisted of a gas generator, an incineration chamber or muffle, a post-combustion chamber below it, and a recuperator thereafter. The gas generator, lined with refractory material, had the usual grill for the coke and openings to regulate air intake and to remove ashes and slag. A vertical or oblique channel conducted the combustion gases into the muffle. As a result of lack of oxygen, the coke burned only partly in the gas generator,

producing gases rich in carbon monoxide, which were led into the muffle, where they burned with additional pre-heated air coming in from the recuperator.

The muffle was a horizontal combustion chamber lined with refractory material. The German “Norms for the construction and operation of furnaces for the cremation of human corpses” enacted in 1937 prescribed the following minimal dimensions for such a muffle: width: 900 millimeters; height: 900 millimeters; length: 2500 millimeters.⁴⁹

At the front, the muffle was closed with a guillotine-like shutter made of fireclay. In front of this shutter was an outer steel door. The bottom of the muffle consisted of a grill made of fireclay, on which the coffin was placed. The remains of the body fell through the refractory grill into the post-combustion chamber with slanted walls narrowing down to a small cavity in which the container for the ashes was placed.

Openings in the post-combustion chamber led the combustion gases into the recuperator, which was a heat exchanger consisting of intertwined, counter-current fresh-air-intake and exhaust-gas-exit channels. As a result of this heat exchange, the recuperator had temperatures between 400 and 600°C. The furnace was a two-level structure: the gas generator and recuperator were at a lower level, while the incineration chamber was at an upper level.

The operation of this system was as follows: First, the shutter of the smoke flue was opened. Then, the coke fire in the generator was lit with the help of some wood. As soon as the combustion gases burning in the muffle had increased the muffle temperature to an operational level, the introduction shutter was opened, and the coffin was introduced into the muffle. Because of the high temperature of the muffle, the coffin caught fire already during the introduction. It burned quickly, leaving the corpse on the grill. First, the corpse dehydrated, then the combustible parts incinerated. The solid incineration products of the corpse fell into the post-combustion chamber and ultimately into the ash container, while the gaseous products moved into the side flues of the recuperator and down through them into the waste-gas flue, whence they rose up the stack. After the flame development had stopped, the incandescent ashes were scraped into the ash container. The furnace was operated with the help of various controls (fuel supply, recuperator and generator air intake, exhaust shutter).⁵⁰

3.5. Coke Consumption of a Cremation Furnace with Coke-Fired Generator

A cremation furnace’s fuel consumption depends considerably on the furnace’s design, the cremation process, the frequency of cremations, the composition of the bodies, and the operation of the furnace. For this reason, it is pointless to speak of a furnace’s fuel consumption without considering at least the following three factors: the furnace’s design, the manner of cremation (direct or indirect), and the frequency with which cremations are carried out.

The procedure during indirect cremations is much more fuel-intensive than that of direct cremations, since the former requires that the entire fireproof mass of the recuperator be heated to 1000°C (about 1830°F). The frequency of cremations has a very significant effect on fuel consumption, since the furnace’s fireclay absorbs most of the heat generated during the first cremations. For this reason, fuel consumption is lowest when the furnace is in thermal equilibrium at operating temperature.

The heat balance of a cremation furnace with coke-fired generator is a problem, very difficult to resolve in theory, since in practice the performance is affected by variables which cannot be predicted in theory, and to which the way the furnace is operated has to be adjusted from case to case.

⁴⁹ *Richtlinien für den Bau von Öfen zur Einäscherung menschlicher Leichen* aufgestellt vom Großdeutschen Verbands der Feuerbestattungsvereine, in: *Zentralblatt für Feuerbestattung*, 5(6) (1933), p. 4.

⁵⁰ See in particular E. Beutinger, *op. cit.* (note 24), pp. 94-127.

In the 1920s, this problem was discussed by scientists like Fichtl⁵¹ and Tilly,⁵² but the most important contribution to its resolution was Wilhelm Heepke's 1933 article on this subject.⁵³

Heepke's calculations showed that the coke consumption per cremation of a medium-sized furnace at thermal equilibrium amounts to 30 kg (66 lbs.) of coke (plus the wooden coffin weighing 40 kg, or 88 lbs.). However, Heepke's findings are marred by errors both in approach and in arithmetics, and his conclusions are thus questionable. If one takes his errors into account, one arrives at a coke requirement of just 20.5 kg (45.1 lbs.). This result is consistent with those of experimental origin. The experiment conducted by R. Kessler with coke fuel on January 5, 1927 resulted in the following fuel consumption:

– total consumption:	436.0 kg (960 lbs.) coke
– preheating of the furnace:	200.0 kg (440 lbs.) coke
– eight successive cremations:	236.0 kg (520 lbs.) coke
– consumption for one cremation, including preheating:	54.5 kg (120 lbs.) coke
– consumption for one cremation, without preheating:	29.5 kg (65 lbs.) coke

The fuel consumption relating to the eight cremations without preheating the furnace still includes the consumption producing the heat that is absorbed by the furnace's firebrick up to the point where thermal equilibrium is reached. A calculation taking into account the heat loss caused by radiation and conduction shows that the coke consumption for a cremation in a furnace at thermal equilibrium is about 20 kg (44 lbs.).

This confirms the correctness of this method of calculation, which can thus also be used to determine the thermal balance of the cremation furnaces at Auschwitz and Birkenau.

3.6. Duration of the Cremation Process with a Coke-Fired Generator

Cremation is a physical and chemical process requiring a certain minimum time that cannot be reduced beyond a certain point.⁵⁴ This minimum time depends mainly on the chemical composition of the body to be cremated. Special experiments conducted in England in the 1970s showed that the body's protein structure is of great importance. Due to its relatively high nitrogen content, its high ignition temperature, and the chemical transformations the proteins undergo at high temperatures, there is a considerable degree of resistance to combustion, which is amplified further by the fact that the protein substance is submerged, as it were, in body fluid and cannot ignite before this fluid has evaporated. In other words: A cremation carried out under optimum conditions cannot take less time than the time required by nature for this process to take place. Conversely, the duration of the cremation cycle increases, the more the actual conditions are removed from the optimum, regardless of whether this discrepancy is due to careless operation of the furnace or to a less-than-ideal furnace design.

Before raising the question of the length of the cremation process or the cremation cycle, we must clarify just exactly what we mean by that. In very general terms, we can say that a cremation is completely finished once the ashes remaining of the body have been removed from the furnace. For a furnace not equipped with an afterburning grate, the cremation time may be defined as the time between the introduction of the coffin into the muffle, and the transfer of the glowing ashes from the ash slope into the ash container, in which they grad-

⁵¹ Engineer Fichtl, "Rationelle Wärmewirtschaft in den Krematorien," *Die Wärme, Zeitschrift für Dampfkessel und Maschinenbetrieb*, 17(34) (1924), pp. 394-397.

This is a consolidated version of the study on thermal equilibrium which engineer Heepke had presented in his aforementioned book, *op. cit.* (note 24), pp. 60-63.

⁵⁴ Cf. Hans Kraupner, Franz Puls, *Die chemischen Vorgänge bei einer Einäscherung*, special offprint from *Städtehygiene*, Ulzen 8/1970.

ually collapse altogether. In a furnace equipped with an afterburning grate, such as the generator furnaces of Beck and Topf and the Volckmann-Ludwig gas furnaces of the 1930s, the end of the cremation process is set as the time at which the glowing ashes are removed from the ash slope, or transferred from the bottom of the muffle to the afterburning grate.

Even though it violated the ethical norms set by R. Kessler in 1932, it was common practice in some crematoria to introduce the next body into the muffle while the remnants of the previous were still burning on the ash slope, so that one muffle actually contained two bodies at the same time, albeit at different stages of the cremation cycle. This process was used in furnaces such as the Volckmann-Ludwig type in Stuttgart, which were equipped with a shutter in the ash settling chamber.

As we have already mentioned, scientific experiments were carried out in England in the 1970s to determine which factors influence the cremation process. The results were announced in July 1975 at the annual conference of the Cremation Society of Great Britain. The experiments were grouped into two series: an introductory series in Ruislip's Breakspear Crematorium, and the main series in Hull's Chanterlands Crematorium. The first group of project leaders selected the factors that, in their opinion, would affect the length of the cremation process. The influence of technical factors was equalized by using the same gas-fired furnace (Dowson & Mason Twin Reflux Cremator) and the same stoker for all experiments.⁵⁵

On the basis of these experiments, it was found that the truly decisive factors regarding the time required for a cremation are the maximum temperature of the furnace, and the sex of the deceased. Statisticians graphically summarized the results of the experiments. One of the analysts, Dr. E. W. Jones, commented as follows:⁵⁵

"From his graph he was able to tell us (we thought this rather interesting) that there is a maximum point, or rather a minimum point, of incineration time below which it is impossible to go, and our statistician defined this as a thermal barrier that, because of the make, the nature of human tissues, you cannot incinerate them at a rate which is below round about 63 minutes. Now some people will come up with readings of 60, 59, 58, they are the lower ends of this scatter of readings, and that this thermal barrier's optimum temperature is round about 800-900°C."

The graph shows that the time most closely approximating the thermal barrier is 60 minutes, given a temperature of 800°C (1470°F). If the temperature is increased to 1000°C (1830°F), the time required for cremation actually *increases* to 67 minutes, and at 1100°C (2010°F) it drops again to 65 minutes. At higher temperatures, which were not investigated, the time would presumably decrease further, and at extremely high temperatures it probably drops below the thermal barrier. Dr. Jones stated that, if one wanted to decrease the cremation time in this way to 20 or even to 15 minutes, one would have to construct a furnace capable of working at 2000°C (3630°F).⁵⁵

In reality, the cremation process must take place between fairly precise thermal boundaries. At temperatures of over 1100 to 1200°C (2010 to 2190°F), one encounters the phenomenon of sintering, where the bones of the corpse and the furnace refractory begin to soften and to fuse together, and at temperatures under 700 to 600°C (1290 to 1110°F), the body merely chars.⁵⁶ Dr. E. W. Jones then reports an observation of particular interest to us:⁵⁵

"Our statistician colleague did some work, he looked into the records of Crematoria in Germany during the last war, and it would appear that the authorities there were presented with a similar problem – that they came up against a thermal barrier. They could not design a furnace that reduced the mean incineration time to a very practical effective level. So we started to look at why there is this thermal barrier with human tissues."

It was found that the cause of this factor was that the proteins in the human body – when they are heated to 800 to 900°C (1470 to 1650°F) – undergo a chemical transformation. They dissociate and form compounds "that can only be described as a hard crust."⁵⁵

⁵⁵ E.W. Jones, R.G. Williamson, "Factors Which Affect the Process of Cremation. Third Session." *Verbatim Report of the 1975 Annual Conference Organised by the Cremation Society of Great Britain*, Cremation Society of Great Britain, Maidstone 1975, pp. 77-87, here p. 81.

⁵⁶ R. Kessler, *op. cit.* (note 30), issue 8, p. 140; P. Schläpfer, "Betrachtungen...", *op. cit.* (note 34), p. 151.

Naturally, the cremation process took longer in furnaces operating with a coke-fired gas generator. Regarding the time required for the cremation cycle, the data found in contemporaneous literature is not reliable at all, first and foremost because what is meant by ‘the time required’ is very rarely clearly defined, and secondly because one must expect that the data have been distorted for reasons of competition or propaganda.

This is why we shall take data supplied by the technical measuring instruments in the furnaces themselves as our objective and incontrovertible starting point. From this perspective, the diagram summarizing the cremations performed by R. Kessler with coke fuel on January 5, 1927 is especially significant. This was a case where one is completely justified in saying that the cremations were carried out under the optimum conditions for a furnace with a coke-fired gas generator, because:

- the furnace’s design was excellent;
- Kessler had taken every measure necessary to prepare the furnace in terms of heat engineering;
- the appropriate technical instruments were used to observe the cremation cycle in every phase;
- the operation of the furnace was particularly impeccable due to the skillful supervision of an expert engineer.

During these experiments, the average cremation time was 1 hour and 26 minutes, while the shortest cremation took 1 hour. The average temperature in the muffle was about 870°C (1600°F). We shall return to this point later. In this context it is important to stress that engineer Kessler was using the method of direct cremation. For comparison, we refer to a different series of eight cremations that Kessler performed in the same furnace, using briquettes instead of coke fuel. That time, the average cremation took 1 hour and 22 minutes. Two weeks later the same experiment, using gas heating for the furnace, returned an average cremation time of 1 hour and 12 minutes for each of the eight cremations.⁵⁷

4. The Topf Cremation Facilities for Concentration Camps

As of the late 1930s, Topf & Söhne as well as other manufacturers, especially the H. Kori Company in Berlin and the Didier-Werke (also in Berlin; see Subchapter 4.4.), began to design cremation furnaces for the concentration camps. These furnaces were of a simplified design compared to civilian furnaces. The Topf Company developed six projects for cremation furnaces of this type:

1. Coke-fired single-muffle furnace, never built.⁵⁸
2. Mobile, oil-fired two-muffle furnace, later converted into a stationary coke-fired furnace. This type of furnace was installed in Gusen (a subcamp of Mauthausen) and Dachau. The first one was ordered by the *SS-Neubauleitung* of the Mauthausen Camp on March 21, 1940, as a mobile, oil-fired furnace (“*fahrbarer Ofen mit Ölbeheizung*”), but on October 9, 1940, it was decided to convert it into a coke-fired furnace.⁵⁹ Topf shipped the furnace by railroad on December 12, 1940, and it arrived at its destination on December 19.⁶⁰ This same day, the *SS-Neubauleitung* of the Mauthausen Camp sent a telegram to Topf with an urgent request for an engineer.⁶⁰ The Topf Company sent its engineer August Willing to Gusen on December 27,⁶¹ who immediately began his work and finished it on January 22, 1941. The two coke-fired gas generators had been installed during the construction of the furnace, which went into operation at the end of January 1941.⁶²

⁶¹ Letter Topf to *SS-Neubauleitung* of KL Mauthausen, Dec. 23, 1940. *BAK*, NS 4 Ma/54.

⁶² Letter *SS-Neubauleitung* of KL Mauthausen to Topf, Feb. 14, 1941. *BAK*, NS 4 Ma/54.

According to a Topf letter to the *SS-Neubauleitung* of Dachau of July 25, 1940,⁶³ the furnace of the Dachau Camp had been delivered even earlier. The SS authority of the Dachau Camp decided also to convert this furnace's heating system by replacing the two oil burners with coke-gas generators. Both converted furnaces do still exist today in these former concentration camps. Initially, the decision of local authorities to convert the heating system of certain cremation furnaces was prompted by the sheer lack of liquid fuel, but on December 17, 1943, the Chief of *Amt CIII* (*Technische Fachgebiete*; Office CIII, technical subjects) of the SS WVHA issued a general decree stating:⁶⁴

"In the crematoria, the use of liquid fuel can no longer be permitted. The modification to solid fuel has to be done everywhere."

3. Coke-fired cremation furnace with two muffles placed opposite each other. This type of furnace appears solely on a drawing of the crematorium at the Płaszów Camp near Krakow. Whether it was ever built is unknown.⁶⁵
4. Coke-fired two-muffle furnace, installed at the Buchenwald Camp. On June 18, 1938, the Construction Office of the SS administration of Buchenwald-Sachsenhausen Camp sent a request to *SS-Gruppenführer* Theodor Eicke, head of the *Totenkopfverbände* and of the concentration camps, to authorize the construction of a crematorium at the Buchenwald Camp. Eicke forwarded this request to the head of the SS administration in Munich with a note in which he endorsed the request because, as a result of an increased number of inmates of this camp, Buchenwald was confronted with deceased inmates almost on a daily basis whose bodies had to be cremated in the Weimar municipal crematorium.⁶⁶ The request was granted, and the authorization was issued by the *Hauptamt Haushalt und Bauten* (HHB, Main Office Budget and Buildings) in early December 1939. For the construction of an "emergency crematorium" (*Notkrematorium*), as it is referred to in German administrative documents, a request was sent to the Topf Company. On December 21, 1939, Topf sent an estimate to the appropriate authorities for "1 oil- or coke-fired Topf incineration furnace with double muffle and compressed-air blowers, as well as forced-draft blowers" for 7,753 RM, plus 1,250 RM for the installation.⁶⁷

In its "Description of the structure of the new construction of an emergency Crematorium in the detention camp Buchenwald", the Buchenwald New Construction Office specified on January 10, 1940:⁶⁸

"Due to the high mortality rates in the Buchenwald Camp, the construction of an emergency crematorium with oil-fired cremation furnace (double-muffle furnace) has become necessary. For this, a location of 6 x 9 m and 4 m height is required."

In its estimate of December 21, 1939, the Topf Company also included a drawing of the furnace, edited the same day,⁶⁹ and a plan for a small crematorium of just 6 m × 9 m × 4 m.⁷⁰ The project was estimated to cost 14,200 RM.⁷¹ No documents regarding the realization of this project are known to me. A later, undated project, probably from 1940, shows a more sophisticated crematorium with outer dimensions of 14 m × 12 m, consisting of five rooms. The furnace room (6.50 m × 4.99 m), however, contains only

one single-muffle furnace.⁷² According to Kurt Prüfer, a Topf two-muffle furnace was installed at Buchenwald in 1940-1941,⁷³ which evidently was the subject of the estimate mentioned above.

5. Coke-fired two-muffle furnace type Auschwitz. Three furnaces of this type were built in the crematorium of the Auschwitz Main Camp between 1940 and 1942; another one was built in 1945 in the crematorium of Mauthausen.
6. Coke-fired triple-muffle furnace. Two furnaces of this model (one also equipped for oil-firing) were installed in the crematorium of Buchenwald in 1942, two in the crematorium of Groß-Rosen in 1942,⁷⁴ and ten in the Crematoria II and III of Birkenau in 1942-1943.
7. Coke-fired eight-muffle furnace. Two furnaces of this type were built in the Crematoria IV and V of Birkenau in 1942-1943, and one half of such a furnace (four muffles) was installed at Mogilew in 1942.

The furnaces of Auschwitz will be described in Subchapters 4.1. through 4.3.

4.1. Topf's Coke-Fired Double-Muffle Cremation Furnaces

The first furnace at Auschwitz was installed between July 5 and 25, 1940, and the first cremation took place on August 15.⁷⁵ The cost estimate for the second furnace is dated November 13, 1940. The Topf Company delivered the various components of the furnace to Auschwitz on December 20 and 21, 1940, and on January 17 and 21, 1941.⁷⁶ It was installed between January 26 and February 22, 1941.⁷⁷

Topf revised its cost estimate for the third furnace on September 25, 1941,⁷⁸ and sent the required material to Auschwitz on October 21, a total of 3,548.5 kg.⁷⁹ Construction of the foundation for the third furnace began on November 19, 1941, and was completed on December 3;⁸⁰ work was then discontinued due to a lack of fireproof material. The pertinent invoice issued by Topf is dated December 16, 1941.⁸¹ Due to a *Waggon Sperre* (railroad-car prohibition⁸²), however, construction of the furnace could not start because the Collmener Schamottewerke Company, supplying Topf with refractory material, had not been able to ship the required material. A railroad freight car with the refractory material, sent from the Plütsch Company, arrived at the camp on January 3, 1942,⁸³ but this furnace was installed only in March 1942.⁸⁴

The furnace for Mauthausen (near Linz, Austria) was ordered from the Topf Company on October 16, 1941, but the SS Construction Office hesitated for a long time before having it installed. The components of the furnace were shipped to Mauthausen between February 6,

⁸² *RGVA*, 502-1-312, p. 98. During the war, companies needed special permission to receive transportation space in railroad cars due to restricted capacity. At times, no cars were assigned for civilian purposes because all transportation was required for the military.

⁸³ *RGVA*, 502-1-312, p. 83.

⁸⁴ *RGVA*, 502-1-22, pp. 11ff.

1942 and January 12, 1943,⁸⁵ but the decision to assemble it was not made until late 1944.⁸⁶ The furnace was finally built in January-February 1945, which explains the fact that it is relatively well-preserved, as it was hardly used.

The two Topf double-muffle cremation furnaces presently on display in the crematorium of the Auschwitz Main Camp were reconstructed after the war, but in a rather awkward manner, using original parts that had been removed from the furnaces by the SS. It is thus entirely pointless to examine these structures in the hopes of gaining an understanding of this type of furnace. For this reason, our investigation is based wholly on the examination of the furnace at Mauthausen, and on the documents available to us relating to the furnaces of Auschwitz and that of Mauthausen – all of which were the same model.⁸⁷

The components of the furnace at Mauthausen are also included on Topf's shipment list of January 12, 1943.⁸⁸ The design of the double-muffle cremation furnace is shown on Plan "Topf D57253," which dates from June 10, 1940, and refers to the first furnace installed at Auschwitz. The furnace is made of solid brick and held together with a number of wrought-iron anchors. The dimensions of the Mauthausen furnace are virtually identical to those shown on Plan D57253, which correspond to the measurements of the anchor irons itemized on Topf's shipment list of January 17, 1941 with respect to the second furnace of Auschwitz. The furnace is equipped with two cremation chambers, or muffles.⁸⁹ The furnace's operation is explained in the "Operation Manual for the Coke-Fired Topf Double-Muffle Cremation Furnace."⁹⁰

The crematorium of Auschwitz was originally constructed in accordance with Plan "Topf D50042" of September 25, 1941, which had been drawn for the installation of the third furnace.⁹¹ Each furnace was equipped with its own compressed-air device; this consisted of an air blower that was operated with a 1.5-hp three-phase AC motor coupled directly to the blower shaft, and an appropriate duct. The square stack originally had an area of $500 \times 500 \text{ mm}^2$ (19.7" \times 19.7"). The forced-draft device, with a capacity of about 4,000 m³/h (141,200 cu.ft./h) of smoke gas, consisted of an exhaust blower powered with a 3-hp three-phase AC motor coupled directly to the blower shaft, with an air shutter separating the high- from the low-pressure side. The function of this installation is described in Topf's respective operation manual.⁹²

The furnace's corpse-loading system consisted of a carriage moving on special rails, and of a shunting carriage running above it, on which the coffin (or the plain corpse) was introduced.

On July 19, 1943, the crematorium was taken out of service,⁹³ and the furnaces were then dismantled.

After the end of the war, the Poles reconstructed Furnaces No. 1 and 2, for which purpose they used the original parts which had been removed by the SS and of which many were still

in the former coke storage room. The reconstruction was done in a remarkably slipshod manner, and the furnaces would not be functional in their present state.

4.2. Topf's Coke-Fired Three-Muffle Cremation Furnaces

Just like the eight-muffle furnace, this furnace was designed by engineer Prüfer during the last months of 1941. On October 22, 1941, the New Construction Office of Auschwitz ordered from the Topf Company five Topf triple-muffle furnaces with compressed-air blower for the "new crematorium" which they intended to construct in the Main Camp. These furnaces were later installed in Crematorium II of Birkenau. The final invoice for this was dated January 27, 1943, and the cost per furnace was RM 6,378.⁹⁴ The five triple-muffle cremation furnaces for Crematorium III were first ordered by the Central Construction Office on September 25, 1942 by telephone, then on September 30 by registered letter.⁹⁵ On October 28, the Topf Company sent the Central Construction Office Plan D59394 for the construction of the furnaces in Crematoria II and III. This plan has been lost.⁹⁶ The final invoice for the five triple-muffle cremation furnaces for Crematorium III of Birkenau is dated May 27, 1943. The cost per furnace was RM 7,830.⁹⁷

The first two triple-muffle furnaces supplied by Topf went into service in the Buchenwald Camp on August 23 and October 3, 1942.⁹⁸

The following description of the Topf triple-muffle cremation furnace is based on direct examinations of the furnaces of Buchenwald and on the documents available. Three photographs from SS sources confirm that the triple-muffle furnaces installed in Crematoria II and III of Birkenau were the same model as those in Buchenwald;⁹⁹ one of these Buchenwald furnaces, however, could also be fired with fuel oil.

Regarding its design, the triple-muffle furnace consisted of a furnace with two muffles, each with one coke-gas generator, and an additional third, central muffle plus other technical modifications which we have described elsewhere.¹

No document is known that clearly states the weight of the refractory masonry of the three-muffle furnace.¹⁰⁰ However, it is known that this furnace was practically nothing else but a double-muffle furnace with a third muffle inserted in the center (without the corresponding gas generator). Since the refractory material of a half double-muffle furnace weighed 5,000 kg (3,000 kg for the muffle and the ash compartment, plus 2,000 kg for the gas generator), the mass of the three-muffle furnace would have been $2 \times 5,000$ kg (two lateral muffles) plus 3,000 kg (center muffle), hence altogether about 13,000 kg.

Considering that the fireproof brickwork of the double-muffle cremation furnace of the type installed at Auschwitz weighed about 10,000 kg (22,000 lbs.),¹⁰¹ it is clear that the triple-muffle furnace was a more economical facility, as one can also infer from the considerably lower price: The third double-muffle furnace of Auschwitz cost RM 7,332 and included a compressed-air blower and a corpse-introduction cart, with the respective rails, to introduce the bodies into the muffles, while the furnaces of Crematorium II of Birkenau cost RM 6,378 each and included a compressed-air device. Considering that two corpse-introduction carts and the rails for five furnaces cost RM 1,780, the triple-muffle furnace with the same equipment actually cost less than a double-muffle furnace. The unit price for the

¹⁰⁰ The data hypothetically assumed in earlier versions of this contribution and also in the first, 2015 edition of our main work, which were based on an invoice of Jan. 27, 1943, seem to relate to material for the flues rather than the furnaces (see the explanation in note 1, Vol. I, p. 274).

¹⁰¹ "Aufstellung der Materialien zu einem Topf-Doppel-Einäscherungssofen" (list of materials for a Topf double-muffle cremation furnace) *BAK*, NS4/Ma 54.

furnaces for Crematorium III, on the other hand, was a little higher (RM 7,380, without the body conveyance), but still cheaper than one-and-a-half double-muffle furnaces.

Crematoria II and III of Birkenau had a large furnace room measuring 30 m × 11.24 m (98.4' × 36.9'). The five triple-muffle cremation furnaces were located along the longitudinal axis. Adjoining the furnace room was a chimney wing 10 m × 12 m (33' × 39') in size and split into two sections by a dividing wall. The smaller section directly adjoining the furnace room was in turn subdivided into three rooms: two engine rooms and a room for one of the three forced-draft devices with which the crematorium was initially equipped. The other section contained the chimney, the other two forced-draft devices and a garbage incinerator, which is why this room was labeled "garbage incinerator" on the corresponding blue-prints.¹⁰² The flue gases from the furnaces were sucked up by the forced-draft devices and blown into the chimney at high velocity.¹⁰³ In March 1943, the three forced-draft devices of Crematorium II overheated and were seriously damaged, so they had to be dismantled. As a result, the forced-draft devices originally intended for Crematorium III were never installed.

Unlike Crematorium II, Crematorium III was not equipped with the rails and a corpse-introduction cart; rather, these body carts were replaced with stretchers.¹⁰⁴ Such a stretcher – they were also used for the Topf double-muffle furnaces at Mauthausen and for the Kori furnaces in other concentration camps – consisted of two parallel metal pipes 3 cm (approx. 1") in diameter and some 350 cm (11.5') in length. At their front end, meant to be introduced into the muffle, a slightly concave metal sheet 190 cm (6.2') long and 38 cm (1.5") wide was welded between the two pipes. The two pipes of the stretcher were thus the same distance apart (41 cm) as the guiding rollers mounted beneath the muffle door, so that they could glide on them easily into the muffle. In March 1943, it was decided that this system would also be introduced in Crematorium II.¹⁰⁵

The operation of the coke-fired triple-muffle furnace is explained in Topf's corresponding operation manual for the coke-fired triple-muffle cremation furnace,¹⁰⁶ which was based on the manual for the double-muffle cremation furnace. The only significant difference relates to the heat tolerance of the muffles, which were not to be heated to more than 1000°C (1830°F), whereas the double-muffle furnace could be heated to 1100°C (2010°F). This lower heat tolerance was probably due to the lower quality of the materials used.

In Germany, cremation in concentration camps had been regulated at the beginning of World War Two by the "Decree regarding cremations in the crematorium of concentration camp Sachsenhausen," which Himmler had issued on February 28, 1940.¹⁰⁷ This decree was entirely in accordance with the legal stipulations in effect for civilian crematoria.¹⁰⁸ It is not known whether these legal regulations were later modified or rescinded, and/or whether other regulations applied to the concentration camps located in the occupied eastern territories than applied to those in the Reich itself, but it is certain that the Topf double- and triple-muffle cremation furnaces were designed along the same norms as civilian furnaces. The Topf cost estimates for these furnaces also list carriages or devices for the introduction of coffins into the muffle, which proves that cremation was originally intended to include a coffin. This is further established by the operating guidelines, which recommended starting the compressed-air blower immediately after the introduction of the body, and to leave it on for about 20 minutes. This recommendation is tailored toward the bodies being introduced

into the muffles in coffins, since the rapid and intensive combustion of the coffin requires a large quantity of air. During cremations without a coffin, on the other hand, this stipulation would be completely counterproductive, because adding a large quantity of cold air during the beginning stage of cremation, where moisture evaporates from the body – a process which deprives the furnace of a large amount of heat – would only have slowed the cremation process.

The operating instructions also indicate that the furnaces were designed for the cremation of one body at a time per muffle, since they specify that the bodies had to be introduced successively.

On July 3, 1940, in order to “put the crematorium into operation” (Crematorium I in the Main Camp), the Topf Company also offered “500 ash urns” and “500 fireclay markers” to the Auschwitz New Construction Office.¹⁰⁹ The latter were numbered plates of fireclay placed on the coffin or directly on the corpse in order to identify the ashes. In 1946, some of these markers were found near Crematorium II. They were handed over to Investigating Judge Jan Sehn,¹¹⁰ who, as far as I know, never mentioned them in his findings about his investigations on Auschwitz. This confirms that not even in Birkenau corpses were cremated anonymously in masses, but one at a time.

4.3. Topf’s Coke-Fired Eight-Muffle Cremation Furnace

This furnace, whose construction was probably shown on the Topf Company’s missing Plans D59555, D60129 and D60132,¹¹¹ was designed by engineer Prüfer, presumably in late 1941. In any case, it was designed along the lines of the triple-muffle furnace, whose design plan bears a lower number, namely D59394.

On December 4, 1941, the Main Office Budget and Buildings in Berlin ordered from the Topf Company, “4 pieces Topf double-4-muffle cremation furnaces” for Mogilew in Russia. The order was confirmed on December 9, but only half the furnace (four muffles) was shipped to Mogilew on December 30, while the rest remained in Topf’s storehouse for the time being. On August 26, in accordance with the suggestion engineer Prüfer had made on the occasion of his visit to Auschwitz on August 19, 1942, the SS Economic-Administrative Main Office ordered that two of the furnaces for Mogilew should instead be sent to Auschwitz. However, the Auschwitz Central Construction Office waited two-and-a-half months before requesting a cost estimate for this model of furnace. Topf sent the estimate on November 16. The total price of RM 55,200 – RM 13,800 for each furnace – included a 6% surcharge, because the company had had to revise the drafts and design new models for the furnaces’ fittings so often.¹¹²

The blueprints of Crematorium IV (and Crematorium V, in mirror image) at Birkenau showing the foundations and the vertical cross-section of the “eight-muffle cremation furnace,” the photos taken by the Poles in 1945 of the ruins of Crematorium V, and the direct examination of these ruins enable us to reconstruct this model of furnace with sufficient accuracy.¹¹³

The coke-fired Topf eight-muffle cremation furnace consisted of eight furnaces with one muffle each, as shown on Topf’s Plan D58173. Four furnaces together made up each of two groups. Each group consisted of two pairs of furnaces, set up in mirror image so that the back and two central walls of the muffle were shared. The two furnace groups were connected to four coke-gas generators and set up in pairs along the same lines, so that they ultimately formed one single furnace with eight muffles. In the corresponding invoice, this was referred to as the “large-area cremation furnace,” due to its size (its base covered an area of about 32 m², or 344 sq.ft.).

Construction Office Drawing No. 1678 of Aug. 14, 1942. *APMO*, neg. no. 20946/6; plan of Crematorium IV (and V) by the Construction Office, no. 2036 of Jan. 11, 1943. *APMO*, neg. no. 6234; *APMO*, neg.fot. nos. 620, 14283, 21334/81, 21334/82, 21334/83, 21334/141; J. A. Topf & Söhne Erfurt Drawing D58173 of Jan. 6, 1941. Single-muffle cremation furnace. SS New Construction Office of the Mauthausen Concentration Camp. *BAK*, NS 4 Ma/54.

The furnace was encased in a solid brick structure containing a series of anchor irons. These are clearly visible on the Polish photographs of 1945, and are still present today in the ruins of this crematorium.

The gas-generator grates were also designed to burn wood, as one can see from Topf's invoice of April 5, 1943, where "wood heating" is mentioned. The system for introducing the bodies into the muffles used a stretcher like the one used in Crematoria II and III; it rolled on two simplified rollers bolted to the anchor irons underneath the muffle doors.

The furnace was probably not equipped with compressed-air blowers, since none are mentioned on the invoice of April 5, 1943. The chimneys were designed without forced-draft devices. The base unit of the Topf eight-muffle cremation furnace consisted of two muffles and one coke-gas generator, and the flue system for the smoke gases corresponded to that of the "single-muffle cremation furnace" shown on Topf Plan D58173.

4.4. The Cremation Furnaces of H. Kori, Berlin, and Ignis Hüttenbau, Teplitz

Regarding the supply of cremation furnaces to German concentration camps, the Berlin manufacturer H. Kori was Topf's major competitor. Kori's coke- or oil-fired furnaces were installed at Dachau, Mauthausen, Majdanek, Stutthof near Danzig, Natzweiler-Struthof, Ravensbrück, Groß-Rosen and Neuengamme, among other places.

Strictly speaking, these furnaces have no immediate significance to a study of the crematoria at Auschwitz and Birkenau. However, since we shall eventually use some data from Kori furnaces to draw certain conclusions about characteristics also present in the Birkenau furnaces, we have also analyzed these Kori furnaces in detail. Since these analyses would go beyond the scope of the present study, we refer the reader to the relevant sources.¹¹⁴

In the course of 1942, a crematorium was built for the Terezín Ghetto, which was called Theresienstadt at that time. A detailed cost estimate exists for this installation dated April 2, 1942 from the firm Ignis Hüttenbau A.G. of Teplitz-Schönau in what was then the Protectorate of Bohemia and Moravia (today's Teplice in Czechia).¹¹⁵ Because of the rapid increase of the mortality in the Theresienstadt Ghetto – from 256 deaths in April 1942, to 2,327 in May and 3,941 in June¹¹⁶ – the crematorium was equipped with four oil-fired furnaces by Ignis Hüttenbau (see Subchapter 6.5.).

5. Coke Consumption of Topf Cremation Furnaces of Auschwitz & Birkenau

5.1. Heat Balance of Topf Double-Muffle Cremation Furnaces at Gusen

The decisive factor influencing the fuel consumption of a cremation furnace is the frequency of cremation: the higher the frequency, the less fuel is required for each individual cremation. For example, the diagram "Subsequent cremations" published by Prof. P. Schläpfer in 1936 based on practical experiences shows a consumption of over 400 kg of coke for the first cremation, starting with a cold furnace, of about 200 kg for the second, and little more

¹¹⁴ In addition to our elaborations in our main work, *op. cit.* (note 1), cf. the following documents: letter from the Didier-Werke, Aug. 25, 1943, to Herrn Boriwoje Palitsch, Belgrade, regarding SS cremation facility in Belgrade. ¹¹⁶ Terezínská Iniciativa (ed.), *Terezínská Pamětní Kniha*, Terezínská Iniciativa, Melantrich, 1995, Vol. I, p. 33.

than 100 kg for the fourth cremation.¹¹⁷ After the eighth cremation, the graph becomes more or less horizontal, reaching a value of 37.5 kg of coke at the twentieth and last cremation.¹¹⁸ This means that 20 discontinuous cremations separated from each other by a day or more would have required more than $(400 \times 20 =)$ 8,000 kg of coke, while 20 consecutive cremations in a warm furnace would have required only $(37.5 \times 20 =)$ 740 kg. From the tenth consecutive cremation onward, the fuel consumption was steady because by then the refractory material was warmed up and absorbed only as much heat as was necessary to compensate for heat losses due to radiation, conduction and convection, *i.e.*, the furnace was in a thermal equilibrium. Therefore, in order to find out the minimal fuel consumption of any cremation furnace, it is necessary to establish the conditions when the furnace is in a thermal equilibrium, *i.e.*, when the furnace gives off as much heat to the surroundings as it gets back from the burning fuel.

Among the few relevant surviving documents on the Gusen Crematorium exists a list compiled by *SS-Unterscharführer* Wassner, head of that crematorium, which documents the number of inmates cremated, and the coke consumption per corpse for the period from September 26 to November 12, 1941. According to this document, 677 corpses were cremated in this crematorium between October 31 and November 12, 1941.¹¹⁹ This amounts to an average of 52 corpses per day, or 26 corpses per day and muffle, with a total consumption of 20,700 kg of coke, or 30.6 kg of coke per corpse.

Since these consumption figures are based on practical data, they are a precious point of departure for the calculation of the heat balance of the Topf furnaces of Auschwitz and Birkenau. Mathematically, the heat balance of a furnace is expressed by an equation consisting of all losses of heat, split up into various factors (heat sinks, for instance loss by radiation, conduction, hot exhaust gases), and all contributions of heat (heat sources, *e.g.*, burning fuel, coffin, corpse).¹²⁰ Except for the volume of air going through the furnace, which depends on how the furnace is operated, all factors can be calculated. But because in the specific case of Gusen the fuel consumption is known by empirical data, all factors can be determined.¹²¹

5.2. Heat Balance of Topf Double-Muffle Cremation Furnaces at Auschwitz

The heat balance of the Topf double-muffle furnaces at Auschwitz can be calculated following this approach by taking into consideration the slightly different operating temperature, cremation time, and surface area of the furnace.¹²² Our calculations for the coke required for a single cremation in this type of furnace in thermal equilibrium resulted in the following:¹²³

¹¹⁷ Diagram entitled “Einäscherungen hintereinander,” in P. Schläpfer, “Über den Bau und den Betrieb von Krematoriumsöfen,” *op. cit.* (note 34), p. 36.

¹¹⁸ Naturally it is necessary to always add the heat produced from the coffin.

¹¹⁹ *ÖDMM (Öffentliches Denkmal und Museum Mauthausen, Public Memorial and Museum of Mauthausen)*, Archiv, B 12/31.

¹²⁰ The calculation of the heat balance was conducted according to the method developed by W. Heepke in his article “Die neuzeitlichen Leicheneinäscherungsöfen mit Koksfeuerung, deren Wärmebilanz und Brennstoffverbrauch,” in: *Feuerungstechnik*, 21(8/9), 1933.

¹²¹ Based on W. Heepke’s model, *ibid.*, the fundamental equation of the Gusen Furnace that expresses the average coke consumption of a cremation is:

$$\frac{L + W2 + W2a + W3 + Vls - W7}{\eta Hu} = 30.6 \text{ kg}$$

with L = heat difference of combustion gases between entry and exit + small losses; W2 = vaporization heat of water of the corpse; W2a = heat required to bring water steam up to the temperature of the exiting combustion gases; W3 = heat of the ashes when extracted from the furnace; Vls = loss of heat of the furnace by radiation and conduction; W7 = calorific value of the body (and coffin, if applicable); ηHu = efficiency of coke.

¹²² In our calculation (note 1), we also made some adjustments to W. Heepke’s equation for losses he did not take into consideration, see there.

¹²³ C. Mattogno, F. Deana, *op. cit.* (note 1), pp. 353-375, here p. 375. It is assumed: for normal corpses a weight of 70 kg; for moderately thin corpses a weight of 55 kg, with loss of 25% of protein and 30% of body fat; for the emaciated corpse 40 kg, with loss of 50% of protein and 60% of body fat.

- normal corpse: 23.3 kg (51.4 lbs.) coke;
- moderately thin corpse: 27.8 kg (61.3 lbs.) coke;
- emaciated corpse (“*Muselmann*”): 32.3 kg (71.2 lbs.) coke.

5.3. Heat Balance of the Topf Three- and Eight-Muffle Cremation Furnaces

The triple-muffle furnace was derived from a double-muffle furnace by inserting a third muffle in between. The two outside muffles behaved like those of a double-muffle furnace, but gave off high-temperature smoke gases to the center muffle. In order to allow the cremation of a body in the center muffle, an excess of combustion air went through the outside muffles, so that their exhaust gases would contain oxygen in sufficient quantities to cremate a body in the center muffle. For this reason, the amount of combustion air was not proportional to the air of the double-muffle furnace, which prevents us from making an exact calculation of this furnace’s heat balance. All we can say for certain is that the coke consumption of the triple-muffle furnace must have been slightly higher than that of a double-muffle furnace due to increased heat losses resulting from a slightly higher air flow, and that there were additional radiation and conduction losses of the center muffle, which can be calculated. Therefore, the equation for calculating the theoretical minimal value of coke consumption for a triple-muffle furnace type Auschwitz is:

$$\left(C2 + \frac{V_{ls3} - V_{ls2}}{2 \times \eta_{Hu}}\right) \times \frac{2}{3} = C3$$

C2 = coke consumption per corpse of a double-muffle furnace;

$V_{ls3} - V_{ls2}$ = difference of heat losses by radiation and conduction between a double-muffle and a triple-muffle furnace;

C3 = coke consumption per corpse of a triple-muffle furnace;

η_{Hu} = coke efficiency.

Thus, the minimal theoretical coke consumption per corpse in a triple-muffle furnace was $\frac{2}{3}$ the value of a double-muffle furnace plus the amount of coke to compensate for the additional heat losses of the third muffle by radiation and conduction. Our results are:

- normal body: ≥ 17 kg (37.5 lbs.) coke;
- moderately thin body: ≥ 20 kg (44.1 lbs.) coke;
- emaciated body (“*Muselmann*”): ≥ 23 kg (50.7 lbs.) coke.

The eight-muffle furnaces consisted of two pairs of connected double-muffle furnaces. Since the combustion gasses of the first muffle passed across to the second muffle, similar considerations apply to this type of furnace: the smoke gasses of the first muffle needed to contain a minimum quantity of oxygen sufficient for the combustion of the corpse in the second muffle. As a theoretical minimum of coke consumption per corpse for this type of furnace, we assume half of that of the double-muffle furnace:

- normal body: $23.3 \div 2 \approx 12$ kg (26.5 lbs.) coke;
- moderately thin body: $27.8 \div 2 \approx 14$ kg (30.9 lbs.) coke;
- emaciated body (“*Muselmann*”): $32.3 \div 2 \approx 16$ kg (35.7 lbs.) coke.

5.4. Observations on the Coke Consumption of the Triple- and Eight-Muffle Furnaces

In a file memo (*Aktenvermerk*) of March 17, 1943, edited by civil employee Jährling “based on data by the Topf & Söhne Company,”¹²⁴ the coke consumption of the four crematoria of Birkenau is estimated to be 7,840 kg coke per day. This document deserves a closer analysis. Regarding the coke consumption, it refers to “10 Feuerungen = 350 kg/stdl.” (10 fireplaces = 350 kg/h), which means that each fireplace of the five triple-muffle furnaces of both Crematorium II and III was expected to consume 35 kg/h of coke;¹²⁵ the same figure of 35 kg/h per fireplace is given for the two eight-muffle furnaces located in the Crematoria IV and V. This document also states that the amount of coke required during continuous operation

¹²⁴ APMO, BW 30/7/34, p. 54.

¹²⁵ Each crematorium had five furnaces with altogether ten fireplaces, two in each furnace.

(“*bei Dauerbetrieb*”) is only $\frac{2}{3}$ as compared to a discontinuous operation, which is explained by the fact that the furnace is in thermal equilibrium, as explained above.

The reduction of coke consumption during 12 hours of activity by $\frac{1}{3}$ from 4,200 to 2,800 kg means that during discontinuous cremations, (4,200 – 2,800 =) 1,400 kg of coke were necessary to reheat the five furnaces,¹²⁶ whereas the remaining 2,800 kg were used for the actual cremations. This results in the following figures:

	COKE THROUGHPUT RATE OF HEARTHES	COKE PER HOUR, MUFFLE & CORPSE	CONTINUOUS OPERATION: $\frac{2}{3}$
triple-muffle furnace	70 kg/h	23.3 kg/h	15.6 kg/h
eight-muffle furnace	140 kg/h	17.5 kg/h	11.7 kg/h

The data in the last column for continuous operations are very close to those calculated above for normal corpses¹²⁷ and confirm the accuracy of our heat balance calculations for both the triple- and the eight-muffle furnaces. The challenge here was in operating the hearths in such a way that they actually consumed less coke per time during continuous operations. Reducing the chimney’s draft was hardly possible, and reducing the amount of coke put on the grate, or fine-tuning the amount of air flowing into the gas generator in the absence of any measuring instruments, required skill, experience and good will on the part of the inmate operators, which could not be relied upon.

6. Time Required for Cremation in the Topf Furnaces of Auschwitz & Birkenau

6.1. The Documents

The highly controversial issue of the time required for a single cremation in the Topf cremation furnaces is addressed in three documents, but they give quite contradictory data.

A letter sent on November 1, 1940 by the Topf Company to the SS New Construction Office of the Mauthausen Camp contained the cost estimate for a “Topf coke-fired double-muffle cremation furnace with compressed-air device” and for a “Topf forced-draft device.”¹²⁸ The letter states:¹²⁹

“Our Herr Prüfer has already informed you that, in the previously offered furnace, two bodies can be cremated per hour.”

Since the furnace at issue is a double-muffle furnace of the Auschwitz type, this information by Prüfer’s means that one body could be cremated per hour and muffle. The furnace’s theoretical capacity was therefore 48 bodies per 24 hours.

The second document is a letter dated July 14, 1941, in which Topf replied to a specific inquiry of the SS New Construction Office of the Mauthausen Camp:¹³⁰

“30 to 36 bodies may be cremated in about 10 hours in the coke-fired Topf Double-Muffle Cremation Furnace.”

Based on this claim, the cremation of one corpse in one muffle would have taken on average 33 to 40 minutes, and the furnace’s theoretical capacity was 72 to 87 bodies per 24 hours.

The third document is a letter dated June 28, 1943 under the name of SS-*Sturmabführer* Bischoff, the Chief of the Auschwitz Central Construction Office, intended to be sent to SS-*Brigadeführer* Kammler, the Chief of the Economic-Administrative Main Office’s Office

¹²⁶ All the refractory material to the point of thermal equilibrium.

¹²⁷ Since the relative consumptions of double-muffle furnaces – and the two outside muffles of the triple-muffles furnaces – are known, the consumption of 15.6 kg per hour and muffle can only refer to a normal corpse; if it referred to a moderately thin corpse, the center muffle of the triple-muffle furnace would not only consume no energy, but it would actually save energy worth almost 11 kg of coke; if it referred to an emaciated corpse, the energy saving would amount to almost 20 kg of coke. Thus, neither of these two cases can be true.

¹²⁸ Topf cost estimate for concentration camp Mauthausen, Nov. 1, 1940. *BAK*, NS 4 Ma/54.

¹²⁹ Letter from the Topf Company to the SS New Construction Office of the concentration camp Mauthausen, Nov. 1, 1940. *BAK*, NS 4 Ma/54.

¹³⁰ Letter from the Topf Company to the SS New Construction Office of the concentration camp Mauthausen, July 14, 1941. Weimar State Archives, LK 4651.

Group C. In this letter, the following 24-hour capacities of the crematoria of Auschwitz and Birkenau are mentioned:¹³¹

– old Crematorium I:	340 persons
– Crematorium II:	1,440 persons
– Crematorium III:	1,440 persons
– Crematorium IV:	768 persons
– Crematorium V:	768 persons
Total:	4,756 persons

Based on this document, the time required for a cremation in the double-muffle furnace was about 25 minutes, and 15 minutes in the three- and eight-muffle furnaces.

In order to determine to what extent the data provided by these three documents are technologically founded, and in order to estimate the minimum time required for the cremation process in the Topf furnaces at Auschwitz, we shall apply four objective test criteria, all of which are based on practical experience:

1. The results of cremation experiments with coke performed by the engineer R. Kessler on January 5, 1927.
2. An excerpt from the cremation lists of the crematorium at Gusen Camp.
3. Numerous excerpts of such lists relating to the crematorium of Westerbork.
4. Finally, the cremation lists of the crematorium at the Terezín Ghetto, containing four oil-fired furnaces made by Ignis Hüttenbau, which were without any doubt the most efficient furnaces built during the Second World War, will allow us to determine the lowest time limit required for the cremation process in the cremation furnaces built during the 1940s in German concentration camps and ghettos.

6.2. Richard Kessler's Cremation Experiments

As indicated in Subchapter 3.6., the time required for the cremation process depends mainly on the structure and chemical composition of the human body, but to a significant extent also on the design and operation of the cremation furnace.

Since the cremation furnaces of Auschwitz and Birkenau were coke-fired, it is appropriate to compare, for a better understanding of the cremation process, the experiment with coke-fired cremations performed by engineer Richard Kessler on January 5, 1927 in the crematorium of Dessau.¹³²

Of course, in order to arrive at a realistic assessment, it is necessary to keep in mind that the furnace by Gebrüder Beck used by Kessler was technically superior to the Topf furnaces of Auschwitz-Birkenau, both due to the higher weight of refractory material and the presence of a recuperator, and because Kessler's furnace was equipped with many monitoring devices permitting effective control during every phase of the cremation. Finally, Kessler's cremations were performed with special caution under the surveillance of an expert engineer, so that the entire process was optimized.

The influence of a coffin – present during Kessler's experiments, but absent in Auschwitz – is considered to have had no influence on the duration of the cremation, because the disadvantage of a slightly delayed beginning of the corpse's cremation was compensated by the advantage of additional heat provided by the burning coffin.

Now to Kessler's experimental results. On average, the initial temperature of the cremation was 800°C (1472°F); the highest temperature during the combustion of the coffin of about 1000°C (1832°F) was reached after 12 min. The highest temperature of combustion of the bodies of about 900°C (1652°F) was reached after 28 min. The average duration of evaporation of body fluids was 27 minutes, while the main combustion process within the muffle lasted some 55 minutes. After that, the intensity of combustion decreased gradually until it stopped after another 31 minutes. Thus, the average duration of the entire cremation was 86 minutes.

¹³¹ *APMO*, BW 30/42, p. 3; *RGVA*, 502-1-314, p. 14a.

¹³² R. Kessler, "Rationelle Wärmewirtschaft in den Krematorien nach Maßgabe der Versuche im Dessauer Krematorium," *op. cit.* (note 30).

It is important to realize that Kessler's cremation process was different from the process applied in Auschwitz-Birkenau: For legal reasons, Kessler had to wait until the glowing ash from the cremated body no longer gave off any flames before he transferred it into the ash container. By contrast, in the Topf cremation furnaces of Auschwitz and Birkenau, the next body was introduced into the muffle as soon as the remains of the first had dropped through the muffle grate into the ash chamber, where the cremation process then concluded. Thus, the main part of the cremation in the Topf furnaces was finished at the point where the remains of the first body dropped through the muffle grate into the afterburn chamber, where they then continued to burn for another 20 minutes. This follows from Topf's guidelines.

In Kessler's case, the average time between introducing the body and attaining maximum temperature was 55 minutes. At the point where the maximum heat was attained, the body was still in the muffle, as the increase of the muffle temperature to almost 900°C (1652°F) shows. Therefore, the duration of the cremation process up to the point where the remains of the body dropped through the muffle grate into the ash chamber was necessarily longer than 55 minutes. As a point of reference, we conclude that the average duration of the main process of a single cremation in a coke-fired muffle was not shorter than 55 minutes.

6.3. Cremation Lists of the Crematorium at Gusen

This list is subdivided in four columns.¹¹⁹ The first one ("*Uhr*") gives the time and the number of wheelbarrows of coke; the second column ("*Datum*") indicates the date of cremation, the third one ("*Leichen*") the number of corpses cremated, the fourth ("*Karren Koks 1 K. = 60 kg*") the total number of wheelbarrows of coke (1 cart = 60 kg), which means that the first column lists the numbers of carts progressively, so the last figure of the first column corresponds to the figure in the fourth column. However, the first column (time) does not give the time of beginning and end of the cremation, but the times when coke was taken from the coke storage, or the time when the relevant numbers of coke carts were unloaded near the furnace.

The only objective criterion that allows establishing the duration of the cremation with some approximation is the combustion capacity of the fireplaces, namely the amount of coke burned in one fireplace in an hour. With natural draft, this capacity was 90-120 kg of coke per hour and square meter. According to the above-quoted memo of March 17, 1943,¹²⁴ the combustion capacity of the fireplaces of the triple- and eight-muffle Topf furnaces of Auschwitz were 35 kg of coke per hour. Since the surface of the fireplaces was 0.3 m², the combustion capacity per m² was $(35 \div 0.3 =) 116.7 \text{ kg/h} \approx 120 \text{ kg/h}$.

The combustion capacity is increased – within certain limits – by the chimney's draft, pulling oxygen through the grate. For coke-fired furnaces, the highest acceptable draft with forced-draft devices (*Saugzug-Anlage*) was 30 mm of water column,¹³³ corresponding to the combustion of about 180 kg of coke per hour and square meter of grate.¹³⁴ Since each fireplace grill of the Gusen furnace had a surface of $(0.5 \times 0.5 =) 0.25 \text{ m}^2$, the maximum capacity, with a draft of 30 mm of water column, was $(180 \times 0.25 =) 45 \text{ kg}$ of coke per hour, or 90 kg for both fireplaces together.

Also, the three forced-draft devices initially installed in Crematorium II at Birkenau worked with a pressure of 30 mm of water column, with a gas volume of 40,000 m³/h, each driven by a 380-Volt/15-HP motor. The standard forced-draft blowers installed in the Gusen Crematorium were also installed in the crematorium at Auschwitz with a gas volume of 4,000 m³/h and an engine of 3 HP. The pressure difference it produced is not known, but it sure was not higher than 30 mm water column.

We return now to the problem of the duration of the cremation. We assume that cremations at Gusen began at 7 am on October 31, 1941, and ended at 23 pm on November 12, 1941, which would have been 304 hours or 18,240 minutes.¹³⁵ The duration of the combustion of 20,700 kg of coke actually consumed (see Subchapter 5.1.) depends of course on the combustion capacity of the fireplaces. As shown above, the maximum combustion capacity of

¹³³ W. Heepke, *op. cit.* (note 24), p. 71.

¹³⁴ G. Colombo, *Manuale dell'ingegnere civile e industriale*. Ulrico Hoepli, Milan 1916, p. 366.

¹³⁵ 12 days plus 16 hours, or 12.67 days.

the two Gusen fireplaces with forced-draft blowers at a pressure of 30 mm water column was about 90 kg/h of coke. This results in a total combustion time of the coke of $(20,700 \div 90 =) 230$ hours or 13,800 min., an average time of activity of the furnace of $(230 \text{ hours} \div 12.67 \text{ days} \approx) 18$ hours per day, and an average incineration time per corpse of $(30.6 \div 45 \times 60 \approx) 41$ minutes. This is the lowest theoretical value.

According to operation instruction of the Topf Company for the double- and triple-muffle furnace, the post-combustion of the corpse residues lasted about 20 minutes; adding this time to the main combustion – 40 minutes – results in a total cremation time of 60 minutes, which represents the limit Dr. Jones called “thermal barrier,” that is to say the lower time limit which cannot be undercut. This duration, as will be explained subsequently, is valid for the Gusen furnace, but cannot be attributed directly to the double-muffle furnace of the Auschwitz type, to which the Topf letter of July 14, 1941, referred to explicitly.

6.4. Cremation List of the Crematorium at Westerbork

The crematorium at Westerbork Camp (Holland) was equipped with a coke-fired Kori furnace, which went into operation on March 15, 1943, at a moment when the mortality was increasing rapidly.¹³⁶ Several documents on the activity of this crematorium have been preserved. Those of interest here are:

- the “Crematorium Operation Book” (*Crematorium Betriebsbuch*) containing the names of the deceased between June 23, 1943, and March 31, 1944, (numbered from 277 to 510, corresponding to the numbers on the urns used) with date of birth and date of death;¹³⁷
- various cremation lists giving the number of corpses cremated, the time each cremation took, and the amount of coke used;¹³⁸
- also, a “List of names of Jewish persons deceased in the Westerbork and Buchenwald Camps and buried in Dutch cemeteries” exists, edited by the Dutch Red Cross, in which all of the names of the dead Jews of Westerbork are recorded in alphabetical order, giving, *i.a.*, the date of birth, date of death and cremation, as well as the urn number.¹³⁹

According to this, cremations did not take place every day, but only after a sufficient number of corpses had accumulated in the morgue of the Crematorium in order to save fuel.

In the Westerbork Camp, a high percentage of the deceased were newborn babies, with 25% in May and June 1943, and 40% in August.¹⁴⁰ Most of these babies were only a few months old, and sometimes only a few days. Usually, two of these corpses were cremated together, and in some cases one baby corpse together with an adult. In a few cases, the corpses of little children were put into the furnace in between the cremation of two adult corpses, so their cremation coincided with the final phase of the preceding and the initial phase of the succeeding cremation. The average duration for cremating an adult corpse individually was 50 min, whereas the cremation of a baby (average age: one year) together with an adult corpse (average age: 70 years) lasted 57 min.

Here, as for the Topf furnaces at Auschwitz-Birkenau, the end of the cremation is defined by the moment when the residues of the corpse(s) fell into the post-combustion chamber, enabling the introduction of a new corpse into the muffle.

6.5. Cremation List of Ignis Hüttenbau Oil-Fired Furnace in Terezín

The Ignis Hüttenbau furnaces in Terezín were by far the most modern and efficient of all those ever installed in German concentration camps. Their design had been inspired by the gas-fired Volckmann-Ludwig furnaces. Additionally, they were equipped with a powerful forced-draft blower and an adjustable oil burner. We will later return to these special installations.

The examination of 717 cremations performed in these furnaces between October 3 and November 15, 1943 (41 days), results in the following:¹⁴¹

- The minimal average cremation time on a single day was about 32 min. in Furnace No. III (November 9, 1943, with 23 cremations) and about 31 min. in Furnace No. IV (October 10).
- The average duration of all cremations was about 36 min. in both furnaces.
- 491 of the 682 cremations, for which the duration is indicated, lasted 35 minutes or less (72%); 22% lasted between 40 and 45 min., 42 lasted between 50 and 60 min., 1 lasted more than 60 min.
- On average, it took some 35 min. to cremate a female corpse, and around 36 min. to cremate a male corpse.

In order to save fuel, cremations were performed only in one furnace at a time, so that it would be kept in thermal equilibrium. After a certain number of cremations, operation was passed on to the other furnace; this was continued in a cyclic manner.

6.6. Conclusions

1) The shortest time required for a cremation of a corpse resulting from experimental data referred to in this chapter is that of the Ignis Hüttenbau furnace in Terezín: 35-36 min. However, it is necessary to keep in mind to what this duration refers, and what made it possible. The Ignis Hüttenbau furnaces were much larger and bulkier than the Topf furnaces. In particular, their muffles were 100 cm high, 90 cm wide, and 260 cm long, while the respective dimensions of the Topf triple-muffle furnaces were 80, 70, and 200 cm. The Terezín furnaces allowed a procedure which was impossible with the Topf furnaces: the body was introduced into the front of the muffle in a light coffin of unfinished boards, which was exposed to the combustion air injected from eight nozzles and the flame of the oil burner, thus quickly burning up. Generally after 30-35 minutes, when the body was basically dehydrated and started to disintegrate, it was pushed into the back part of the muffle. There, the main combustion took place and the remains fell into the post-combustion chamber. This way, another corpse could already be introduced after the last one had barely dehydrated.

2) Such a procedure was impossible with the Topf furnaces, both because they were coke-fired and because the dimensions of its muffles rendered it impossible. In the Topf double-muffle furnace at Gusen, the theoretical minimal duration of 40 min. depended first of all on the special structure of the muffles' refractory grate (consisting of transversal and longitudinal beams forming eight rectangular openings of 30 cm × 25 cm), which allowed huge body parts to fall into the post-combustion chamber pretty early, completing the main combustion in there and freeing the muffle for the next corpse. The muffles of the Topf furnaces at Auschwitz, on the other hand, had only transversal beams with a gap of ca. 20 cm between them. Second, the forced-draft blowers in Gusen were much more efficient than those installed in Crematorium 1 at Auschwitz, where the same type of installation served six muffles instead of just two like in Gusen, while none of the Birkenau crematoria had any forced-draft devices. Thus, the cremation capacity alleged in the Topf letter of July 14, 1941, was based on experiences with the furnace at Gusen, but not with those of Auschwitz: the claimed capacity of 30 corpses in ca. 10 hours (= 40 min. for each main cremation phase in the muffle) assumed the highest obtainable forced-draft pressure. In light of the results obtained with the Ignis Hüttenbau furnaces, a capacity of 36 corpses in ca. 10 hours (= 33 min. for each main cremation phase in the muffle) was impossible to achieve as an *average cremation time*, a value that could be attained only in exceptional cases. The duration of 40 min. represents a minimum limit, which could not be achieved with the Topf furnaces of Auschwitz-Birkenau.

3) The average duration of cremations performed at Westerbork was 50 min., which was confirmed by experiments performed by engineer Kessler. We must consider, however, that the Kori furnace of Westerbork could provide more heat than the Topf furnaces at Auschwitz due to a bigger fireplace area (0.8 m × 0.6 m, capacity of ca. 58 kg/h of coke),¹⁴² and that

¹⁴¹ For details and sources see our study, *op. cit.* (note 1), Vol. 1, pp. 400-405.

¹⁴² Drawing H. Kori J.No. 9239.

the Topf letter of November 1, 1940, cited above, speaks of an average duration of a cremation in the Auschwitz type furnace of 60 min.¹²⁹

4) The 60-minute duration for cremating a single body in the furnaces at Birkenau was confirmed by the Topf engineers Kurt Prüfer and Karl Schultze during their interrogation by the Soviet counter-espionage service *Smersh*. During the interrogation on March 4, 1946, K. Schultze stated:¹⁴³

“Five furnaces were located in the two crematoria, and three corpses were introduced in each furnace [one in each muffle], i.e., there were three openings (muffles) in each furnace. In one crematorium with five furnaces [and fifteen muffles], one could incinerate fifteen corpses in one hour.”

During the interrogation on March 5, 1946, K. Prüfer explained why the cremation lasted so long in the Birkenau crematoria:¹⁴⁴

“In civilian crematoria, pre-heated air is blown in with the help of special bellows, due to which the corpse burns faster and without smoke. The construction of the crematoria for the concentration camps is different; it was not possible to pre-heat the air, as a result of which the corpse burned slower and with smoke developing. In order to reduce the smoke and the smell of a burning corpse, a fan is used.

Question: How many corpses would be cremated per hour in a Crematorium in Auschwitz?

Answer: In a crematorium that had five furnaces and fifteen muffles, one cremated fifteen corpses in an hour.”

Thus, these two engineers also confirmed that the cremation furnaces of Auschwitz-Birkenau could incinerate one corpse per hour and muffle. Now that we have determined the average duration of a cremation in these furnaces, we must address the question of whether the simultaneous cremation of several corpses in a muffle of the Topf furnaces would have saved any time and fuel. This question will be discussed in Subchapter 7.2.

7. Cremation Capacity of the Auschwitz Cremation Furnaces

7.1. Uninterrupted Operation of the Furnace

Even though the duration of the cremation process is an important factor contributing to the capacity of a cremation furnace, it is not the only factor, because it is also influenced greatly by two other factors: the time span during which cremations can be carried out without interruptions, and whether two or more corpses can be cremated concurrently. In this Subchapter, we will consider the first factor.

Like any furnace fired with solid fuel, the functionality of a coke-fired furnace depends on the working conditions of the fireplace grill, which decreases inevitably as a result of the formation of slag. For this reason, Topf's operation manual for the double- and triple-muffle furnaces stated:¹⁰⁶

“Every evening the generator grill must be cleaned of coke cinders and the ash must be removed.”

7.1.1. Formation and Removal of Cinders

The formation of slag in the fireplaces of the coke-gas generators is an inevitable phenomenon, because every solid fuel contains incombustible ingredients that melt at high temperatures, which drain down through the layer of fuel and solidify on the grill due to the cooling caused by the fresh air fed into the generator, eventually blocking the gaps between the grill bars.¹⁴⁵ The melting point of coke slag fluctuates between 1,000 and 1,500°C, but is usually

¹⁴⁴ *FSBRF*, Fond N-19262J, p. 33a; cf. Mattogno/Graf, *op. cit.* (note 73), p. 129.

¹⁴⁵ Hans Schulze-Manitius, “Moderne Feuerungsroste,” *Feuerungstechnik*, 23(8) (1935), pp. 86-90, here p. 89.

around 1,100-1,200°C,¹⁴⁶ whereas the temperature of coke fireplaces is ca. 1,500°C.¹⁴⁷ To give an idea about the quantity of slag produced on the fireplace grill, we refer to the cremation experiments by R. Kessler of January 5, 1927, during which 436 kg of coke resulted in 21 kg (4.8%) of slag.¹⁴⁸

The removal of slag from the surface of the grill, to which it was sintered firmly, required special tools and was an arduous task. It required, of course, that the grill was free of coke, which means that the furnace was shut down. Thus, the time required for the entire procedure included the time to shut down the furnace and to reheat it afterwards.

7.1.2. Duration of Consecutive Operations

In a letter by the Kori Company to *SS-Sturmbannführer* Lenzer of the Lublin POW Camp (Majdanek) of October 23, 1941, the warm-water production for 50 showers by using the excess heat of the Kori five-muffle furnace was considered for “a daily operation of 20 hours” (“*täglich bei einem 20 Stundenbetrieb*”).¹⁴⁹ Since in this project engineer Kori aimed to obtain the highest efficiency possible, it is clear that he expected an interruption of the furnace’s activity for four hours each day, which was probably the time required to clean the fireplaces. We can therefore assume that these furnaces normally operated uninterruptedly for 20 hours a day. This does obviously not mean that the furnaces were unable to operate for more than 20 hours continuously, but only that they worked more efficiently when subject to a 20/4 hours operating/cleaning cycle.

In his testimony during the trial against Rudolf Höß, engineer Roman Dawidowski assumed a period of “3 hours of interruption per day for extracting the slag from the gas generator and for various smaller activities.”¹⁵⁰

7.2. Simultaneous Cremation of More Than One Corpse in One Muffle

To complete the study of the cremation capacity of the Topf furnaces, it remains to be examined whether it was possible to increase the capacity of the furnace by increasing the load, that is to say, by introducing two or more adult corpses into a single muffle. Such a practice was forbidden by law for civilian crematoria. As described above, in the Westerbork crematorium this practice was applied only for the simultaneous cremation of adult corpses with the corpses of babies. In the crematorium of Terezín with its four huge oil-fired furnaces, the simultaneous cremation of two corpses in one muffle was common practice, but the corpses were introduced consecutively, one in front of the other. This procedure required a completely different furnace design than that of the Topf furnaces designed for the concentration camps, so the experiences with the Terezín crematorium cannot serve as a point of reference for the controversial problem analyzed in this chapter.

7.2.1. Experiences with Incineration Furnaces of Animal Carcasses

From a practical point of view, the technical approach to simultaneously cremate several corpses is the operation of incineration furnaces for animal carcasses. The following table summarizes the results of the operation of eight furnace models for the incineration of animal carcasses by the Kori firm,¹⁵¹ with the following data in the respective column numbers:

- 1: type of furnace
- 2: maximum load of the furnace with organic substance
- 3: relative consumption of fossil carbon¹⁵²
- 4: duration of combustion process
- 5: quantity of fossil carbon required to incinerate 1 kg of organic substance

¹⁴⁶ A.J. ter Linden, “Feuerräume und Feuerraumwände,” *Feuerungstechnik*, 23(2) (1935), pp. 14-20, here p. 14.

¹⁵⁰ *AGK*, NTN, 93, p. 47.

¹⁵¹ W. Heepke, *Die Kadaver-Vernichtungsanlage*, Verlag von Carl Marhold, Halle/Saale 1905, p. 43.

¹⁵² This is a theoretical figure assuming carbon that has no other components in it, neither combustible nor incombustible. This way, the influence of coal and coke of various caloric values is eliminated.

6: time required to incinerate 1 kg of organic substance
7: quantity of organic substance incinerated in 1 min. (in kg)

1	2	3	4	5	6	7
1a	250 kg	110 kg	5.0 h	0.440 kg	72 sec	0.83 kg
1b	310 kg	130 kg	6.0 h	0.419 kg	70 sec	0.86 kg
2a	370 kg	150 kg	7.0 h	0.405 kg	68 sec	0.88 kg
2b	450 kg	170 kg	8.0 h	0.377 kg	64 sec	0.94 kg
3a	540 kg	200 kg	9.5 h	0.370 kg	63 sec	0.95 kg
3b	650 kg	225 kg	10.5 h	0.346 kg	58 sec	1.03 kg
4a	750 kg	265 kg	12.0 h	0.353 kg	58 sec	1.04 kg
4b	900 kg	300 kg	13.5 h	0.333 kg	54 sec	1.11 kg

These data are valid points of reference for the subject of this chapter, because these furnaces really performed simultaneous cremations of several animal carcasses, or parts of them, in the same muffle.

In the furnace with the highest capacity, Model 4b, the simultaneous incineration of 900 kg of organic substance, which equates to almost 13 human bodies of 70 kg each (an average adult human), required 54 seconds per kg of organic substance, and consumed 0.333 kg of fossil carbon per kg of organic substance. For a 70-kg body, this corresponds to 63 minutes and 23.3 kg of fossil carbon.

The furnace Model 2b had a muffle with a surface area (1.38 m²), which was quite comparable to that of the Topf triple-muffle furnace (1.4 m²). In this furnace model, the cremation of several corpses of a total weight equal to the greatest load (450 kg) would have resulted in a cremation time of 75 minutes and a fuel consumption of coke equal to 28.2 kg for each corpse of 70 kg. However, since the Kori furnace had been specially designed for the mass incineration of animal carcasses, these data cannot be transferred directly to the Topf furnaces, which means that, with the same load, the Topf furnaces would have required more time and fuel. In other words: It is feasible to state that simultaneous cremations of multiple corpses, instead of their subsequent cremation, would not have resulted in any savings in the furnaces of Auschwitz-Birkenau, neither in time nor in fuel. In fact, such a procedure would have backfired big time, because several effects of piling multiple corpses into the small Auschwitz muffles have to be considered:

1. Introducing numerous cold corpses would have reduced the temperature at the beginning of the cremation so strongly that the cremation process would have slowed down tremendously. The fireplaces were not designed to supply the heat needed for such a situation.
2. Reducing the free volume in the muffle by cram-packing it with corpses would have led to a drastically increased speed with which the combustion gases flowed through the muffle. The heat produced by the burning coke-gas, rather than being transferred to the muffle walls and corpses, would have been lost in the flue and chimney.
3. Once the corpses burned (after dehydration), the flow rate of the gasses would have increased even further by several corpses producing smoke gasses instead of just one. This means that the combusting gases would have rushed very quickly through the muffle, entering the flue while still burning, thus overheating and damaging the flue and chimney.
4. The muffles of the Birkenau triple- and eight-muffle furnaces were interconnected with openings in the muffle walls, through which the hot combustion air flowed. If too many corpses were piled up in the muffle, these holes would have been partly or completely blocked, slowing down or completely stopping the cremation process in all muffles.

In addition, the muffle doors of these furnaces were so small – 60 cm wide and high, with the upper half forming a semi-circle, and the lower 10 cm being taken up by the rollers and stretcher used for introducing the corpse(s) – that it may have been possible to squeeze two corpses through them, but certainly not more.

7.2.2. The Experiences of the Westerbork Crematorium

Experiences from consecutive cremations in the Westerbork crematorium confirm this conclusion. As indicated in Subchapter 6.4., the corpses of two adults were never cremated together in this crematorium. The only kind of simultaneous cremation was that of an adult corpse together with the corpse of a baby. As shown, this prolonged the average cremation time by 14% (from 50 to 57 minutes), which is at least equal to, if not considerably more than, the percentage of the baby's weight compared to that of the adult ($5\text{--}10\text{ kg} \div 70\text{ kg} = 7\text{--}14\%$). This indicates that the simultaneous cremation of two adults would have at least doubled the duration of a single-corpse cremation.

7.3. Soviet Claims about the Kori Furnaces at Lublin-Majdanek, Sachsenhausen, and Stutthof

After the occupation of the eastern concentration camps by the Red Army, the Soviets established various 'Investigative Commissions' that investigated, among other things, the technical features of the cremation furnaces at the Stutthof Camp (May 1945),¹⁵³ the Sachsenhausen Camp (June 1945)¹⁵⁴ and the Majdanek Camp (August 1944).¹⁵⁵ The Soviet experts established the duration of a cremation on the base of a "Guiding diagram for the determination of the time of combustion of corpses in various cremation furnaces as a function of the temperature," claiming the following relation between temperature and the duration of cremation:

1. Klingenstierna furnace:	800°C:	120 min
	900°C:	105 min
2. Siemens furnace:	1,000°C:	90 min
	1,100°C:	75 min
	1,200°C:	60 min
3. Schneider furnace:	1,300°C:	45 min
	1,400°C:	30 min
	1,500°C:	15 min

The source of the data used to edit the diagram is unknown, but it must be assumed that all data with temperatures above 1000°, which were not reached by any crematorium at that time, must have been extrapolated linearly, which is utterly inadmissible because at a theoretical temperature of 1,600°C, this would lead to a cremation time of zero minutes – and even of negative times beyond that!¹⁵⁶ As described in Subchapter 3.1., all three furnaces listed here were extremely old models. They all operated with the indirect firing method, where only heated air of up to 1000°C was employed for the cremation, which took between 45 and 90 minutes.

The Soviet experts performed another inadmissible extrapolation regarding the load of the furnaces. Since simultaneous cremation were outlawed in civilian crematoria, as a result of which there were no empirical data in this regard, the Soviet experts simply took the data relating to individual cremations, but attributed the cremation times to a muffle loaded with two to twelve bodies. But as was shown in the previous subchapter, increasing the load of a muffle designed for a single corpse unavoidably leads to a progressive increase of the incineration time. Therefore, this diagram of the Soviet experts is lacking scientific foundation.

The coke-fired Kori furnaces at Sachsenhausen, Majdanek, and Stutthof with an average operating temperature of 800°C and an average duration of a single cremation of 50 minutes (like the Kori furnace at Westerbork) could incinerate 144, 115, and 58 bodies in 24 hours, respectively. This means that the Soviet experts calculated capacities which were five times higher than the actual capacity of the Sachsenhausen crematorium, thirteen times higher than

¹⁵³ "Protocol about technical features of the SS concentration camp of Stutthof," May 14, 1945. *GARF* (Gosudarstvenni Archiv Rossiskoi Federatsii, Moscow), 7021-106-216, pp. 5f.

¹⁵⁴ *GARF*, 7021-104-3, pp. 26-31.

¹⁵⁵ *GARF*, 7021-107-9, pp. 245-249. The original report in Russian has been reproduced in J. Graf, C. Matogno, *Concentration Camp Majdanek: A Historical and Technical Study*, 3rd ed., Castle Hill Publishers, Uckfield, 2016, p. 318.

¹⁵⁶ Cf. also Richard Kessler, *op. cit.* (note 30), p. 136.

that of the Majdanek crematorium, and ten times higher than that of the Stutthof crematorium! What needs to be pointed out, however, is the fact that not even the Soviet experts dared to attribute cremation times lower than 60 minutes to cremation furnaces: even to the highest temperature, 1100°C, occurring only for a few moments, they assigned a substantial duration of 75 minutes.

7.4. Auschwitz Furnace Capacity for Normal Bodies

Therefore, given the capacity of one body per hour and 20 hours of operation per day, the actual theoretical maximum capacity of the Topf cremation furnaces of Auschwitz and Birkenau per 24 hours was as follows:

CREMATORIUM	# MUFFLES	OPERATION	CAPACITY
Crematorium I	6	× 20 h/day =	120 normal bodies/day
Crematorium II	15	× 20 h/day =	300 normal bodies/day
Crematorium III	15	× 20 h/day =	300 normal bodies/day
Crematorium IV	8	× 20 h/day =	160 normal bodies/day
Crematorium V	8	× 20 h/day =	160 normal bodies/day
Total	52	× 20 h/day =	1,040 normal bodies/day

This cremation capacity is, however, purely theoretical, because it ignores an important fact: according to the memo of March 17, 1943,¹²⁴ the normal activity of the crematoria was only 12 hours per day, of which the first hour was probably needed to bring the furnaces back to operational temperature, meaning that only 11 hours were left for actual cremations. Hence, the actual capacity was only 60% of the values given above:

CREMATORIUM	# MUFFLES	OPERATION	CAPACITY
Crematorium I	6	× 11 h/day =	66 normal bodies/day
Crematorium II	15	× 11 h/day =	165 normal bodies/day
Crematorium III	15	× 11 h/day =	165 normal bodies/day
Crematorium IV	8	× 11 h/day =	88 normal bodies/day
Crematorium V	8	× 11 h/day =	88 normal bodies/day
Total	52	× 11 h/day =	572 normal bodies/day

7.5. The Reason for Extending the Cremation Facilities in Birkenau

Originally, only one new crematorium with 15 muffles was planned to be constructed in Birkenau (Crematorium II), but this plan was extended in 1942 to four crematoria with altogether 46 muffles. There were two related reasons for extending the cremation facilities at Birkenau. The first reason was an order given by Himmler during his visit to Auschwitz on July 17 and 18, 1942, to enlarge the camp so it could hold 200,000 inmates.¹⁵⁷ The second factor was the inmates’ mortality, caused by a terrible typhus epidemic that got out of control also in July 1942.

August 1942 was the month with the highest mortality in the entire history of the Auschwitz Camp.¹⁵⁸ Some 8,600 inmates died during that month alone, almost twice as many as during the previous month (about 4,400 deaths). The first known evidence for the decision to erect three more Crematoria is dated August 14, 1942 (which is the date given on the Blueprint No. 1678 for the Crematoria IV/V¹⁵⁹). By August 13, 2,593 inmates had already died during that month, with an average mortality of almost 200 deaths per day. During the six days of August 14 to 19 – the day which is referred to in the discussions summarized in a memo of August 21¹⁶⁰ –, the mortality was even higher: 2,486 deaths, on average ca. 415 per day. The maximum was reached on August 19 with 542 deaths. On August 1, 1942, 21,421 inmates were incarcerated in the men’s camp. Just 18 days later, on August 19, almost 20% of them had died – 4,113, to be accurate. That is on average 216 per day; 1,675

¹⁵⁷ Letters Bischoff to Amt CV of SS WVHA, Aug. 3 and 27, 1942. *GARF*, 7021-108-32, pp. 37 and 41.

¹⁵⁸ See my study *The Real Auschwitz Chronicle*, Castle Hill Publishers, Bargoed, 2023, Part 2, pp. 188-191. All the mortality data mentioned below were taken from this book.

¹⁵⁹ *APMO*, negative n. 20946/6

¹⁶⁰ *RGVA*, 502-1-313, pp. 159f.

of them had died between August 14 and 19 (279/day). Between August 1 and 19, 1942, the average strength of the men's camp was 22,900. If already such a small population could result in a mortality of 500 corpses per day, what would have happened if a similar epidemic had erupted with a camp holding 200,000 inmates?

8. Days of Operation of the Birkenau Crematoria

The following table shows from when and until when the crematoria of Birkenau existed:

	TIME IN EXISTENCE	DAYS
Crematorium II	March 15, 1943 – November 27, 1944	624
Crematorium III	June 25, 1943 – November 27, 1944	522
Crematorium IV	March 22, 1943 – October 7, 1944	566
Crematorium V	April 4, 1943 – January 18, 1945	656
Crematoria II and III together		1,145
Crematoria IV and V together		1,222

However, the Topf cremation furnaces of Birkenau suffered constantly from defects, which interrupted their activity frequently and sometimes for long periods of time.

Crematorium II was subjected to the first serious repairs a little more than a week after it started operating. On March 24 and 25, 1943, the Topf engineers Prüfer and Schultze came to Auschwitz to verify the extent of the damage.¹⁶¹ At the beginning of April, it was discovered that the damage was not limited to the three forced-draft units, which had burned out, but that parts of the refractory material of both flue and chimney had collapsed,¹⁶² so that the Auschwitz Central Construction Office asked Prüfer during his visit (between April 4 and 9) for a “new suggestion regarding the chimney lining.”¹⁶³ From a drawing of the Central Construction Office, it turns out that the damage had affected parts of the walls delimiting the chimney's center smoke channel.¹⁶⁴ Thus, this crematorium remained inactive from May 17¹⁶⁵ to September 1, 1943,¹⁶⁶ and was doubtlessly operated only at reduced load between the beginning of April and May 16.

Crematorium III was in service from June 25 to December 31. Crematorium IV quickly suffered irreparable damage, and could operate only from March 22 to May 10.¹⁶⁷ As for Crematorium V, it was most likely in service at least until Crematorium III was put into operation, in other words for less than three months, from April 4 to June 24.¹⁶⁸

Thus, the following picture emerges of the service and downtime periods of the four crematoria of Birkenau in 1943:

¹⁶¹ *APMO*, BW 30/25, p. 8.

¹⁶² *APMO*, BW 30/34, p. 17.

¹⁶³ Memo of Kirschnek from Sept. 14, 1943. *RGVA*, 502-1-26, p. 144.

¹⁶⁴ The chimney of Crematoria II & III was subdivided into three smoke channels with a cross-section of 80 cm × 120 cm.

¹⁶⁵ Between May 17 and 19, Topf engineer Messing disassembled the three forced-draft blowers of Crematorium II (*RGVA*, 502-1-306, pp. 91-91a). A few days later, the Koehler company began the repair job (*RGVA*, 502-1-313, p. 37).

¹⁶⁶ The work was probably finished toward the end of August, because on August 30, the Central Construction Office requested various painting products from the Supplies Administration for Crematorium II (*RGVA*, 502-1-314, p. 23).

¹⁶⁷ This date is also only approximate. Cracks already appeared in the eight-muffle furnace of Crematorium IV as early as April 3 (*APMO*, BW 30/34, p. 42); the SS Construction Office's telegram to the Topf Company, dated May 14, 1943, requests “calculations re. heat engineering for stacks of Crematoria II and IV” (*APMO*, BW 30/34, p. 41). This means that the Chimney of Crematorium IV had also been seriously damaged before this date.

¹⁶⁸ Pressac claims that Crematorium IV was no longer used after September 1943 (J.-C. Pressac, *Les crématoires...*, op. cit. (note 7), p. 81), but does not document his claim. According to R. Höß, the crematorium had to be “had to be repeatedly shut down, since after its fires had been burning for from four to six weeks, the ovens or the chimneys burned out” (R. Hoess, *Commandant of Auschwitz: The Autobiography of Rudolf Hoess*, Weidenfeld & Nicolson, London 1959/The World Publishing Company, Cleveland, OH, 1959, p. 215).

	TIME PERIOD	EXISTENCE	IN SERVICE	OUT OF SERVICE
Crematorium II	March 15 – Dec. 31	292 days	166 days	126 days
Crematorium III	June 25 – Dec. 31	190 days	190 days	–
Crematorium IV	March 22 – Dec. 31	285 days	50 days	235 days
Crematorium V	April 4 – Dec. 31	272 days	82 days	190 days
TOTAL:		1,039 days	488 days	551 days

Furthermore, from October 21, 1943 to January 27, 1944, in other words for 98 days, several furnaces of Crematoria II and III were probably out of service due to repairs on 20 furnace doors.¹⁶⁹

The data available for 1944 are less complete. On February 2, 1944, the Central Construction Office asked the camp commandant again for permission to allow the engineers Prüfer and Holick access to the camp “in order to inspect and repair the damages to the large disinfection facility in the POW camp and in the crematoria.”¹⁷⁰ On February 22, 1944, the garrison administration (*Standortverwaltung*) ordered the Central Construction Office to supply 400 refractory bricks “for urgent repairs of the crematoria.”¹⁷¹

On April 3, 1944, an order was issued for the “repair of 20 furnace doors” for the furnaces of Crematoria II and III. These repairs were completed on October 17, *i.e.*, 196 days later.¹⁷²

By beginning of May 1944, some refractory lining of the crematoria’s smoke flues and chimneys were damaged again, because on May 9, the head of the Central Construction Office of the Birkenau Camp asked the camp commandant for a “permission to enter the Crematoria I-IV” (II through V in today’s numbering system) for the Koehler Company,¹⁷³ because it had been “commissioned to make urgent maintenance works at the crematoria.”¹⁷⁴

Between June 20 and July 20, a further “two large and five small furnace doors” were repaired.¹⁷⁵ In 1943, Crematorium IV sustained irreparable damage, and Crematorium V was also seriously damaged. In early June 1944, there was an attempt to repair them, as the order of June 1 to “repair 30 furnace doors” in these crematoria shows.¹⁷² The repairs were completed on June 6, 1944, and that very same day another order was issued for “repairs” to Crematoria II through V. These repairs were completed on September 6.¹⁷²

However, if we take Pressac’s word, Crematorium IV was used as a dormitory from late May 1944 on for the prisoners making up the *Sonderkommando*.¹⁷⁶ One can thus assume that Crematorium IV was not in service at all in 1944, whereas Crematorium V was functional from early June 1944 until January 18, 1945, *i.e.*, for 230 days.

We summarize. In 1943, Crematorium II worked at least from April 9 to May 16 at reduced load, *i.e.*, for at least 38 days. The damage to the chimney of Crematorium I in the summer of 1942, which subsequently had to be torn down and rebuilt, no doubt made the Central Construction Office somewhat careful, so that it is reasonable to assume a 50% work load, hence operation time for Crematorium II for this period of time (= 10 h per day), which is equivalent to 19 days of 100% operation. From May 17 to August 31, Crematorium II remained closed for 107 days. In addition to this, some individual furnaces were out of service as a result of repairing individual furnace doors (20 doors for 294 days and 7 doors for 30 days, which is equivalent to 10 furnace doors for ca. 600 days). If taking into account that each triple-muffle furnace had ten furnace doors of various kinds, and that Crematoria II and III had ten such furnaces altogether, this amounts to 60 more days of inactivity for these crematoria.

On February 2, 1944, damages to the refractory material of Crematoria II and III were discovered, which was repaired by February 22. These damages affected at least two furnaces (one in each crematorium), leaving them inactive for at least 25 days, which is equivalent to (25÷5=) 5 days of activity for each crematorium as a whole.

¹⁷⁵ D. Czech, *op. cit.* (note 80), p. 637.

¹⁷⁶ J.-C. Pressac, *Auschwitz...*, *op. cit.* (note 6), p. 389.

At the beginning of May 1944, the flues and/or chimneys of Crematorium II, III, and V had to be repaired again. In lack of any sources, we assume that the ensuing intensive repairs took only three days to complete for each crematorium.

In 1944, therefore, Crematoria II and III remained inactive for at least $(60+5+5+3+3=)$ 76 days, or on average 38 days per crematorium, and Crematorium V for at least 3 days.

Thus, the service times for the cremation furnaces of Birkenau for the year 1944 (and for January 1945) may be summarized as follows, although this does not take into account the downtime of individual furnaces as mentioned earlier:

	TIME PERIOD	DAYS	IN SERVICE	OUT OF SERVICE
Crematorium II	Jan. 1 – Oct. 30	304	266 days	38 days
Crematorium III	Jan. 1 – Oct. 30	304	266 days	38 days
Crematorium IV	–	–	–	–
Crematorium V	Jan. 1 – Oct. 30	304	144 days	160 days
TOTAL:		912	676 days	236 days

For the present considerations, the operational period of all crematoria will end on October 30, 1944, because the alleged mass murders in the crematoria are said to have ceased on that day. Now we can calculate the total number of days on which the crematoria of Birkenau were in service:

- Crematoria II and III together: 888 days in Service
- Crematoria IV and V together: 276 days in Service

From March 15, 1943, to October 30, 1944, ca. 50,000 registered inmates died a ‘natural death’ in the camp according to the *Auschwitz Death Books*,¹⁷⁷ of whom some 3,050 were cremated in Crematorium I.¹⁷⁸ Assuming that the remaining 46,950 corpses were cremated in proportion to the days of activity and the number of muffles of the crematoria (Crematoria II & III = 86%, Crematoria IV & V = 14%), this means that some 40,400 corpses were cremated in Crematoria II & III and some 6,650 in Crematoria IV & V. In case of 20 hours of activity per day of the cremation furnaces (see table Subchapter 7.4.), the cremation of these bodies required thus:

- Crematoria II & III: $(40,400 \text{ corpses} \div 300 \text{ corpses/day}) =$ 135 days
of both crematoria together
- Crematoria IV & V: $(6,650 \text{ corpses} \div 160 \text{ corpses/day}) =$ 42 days
of both crematoria together

So, for further cremations there would have remained:

- Crematoria II & III: $(888 - 135 =)$ 753 days of both crematoria together
- Crematoria IV & V: $(276 - 42 =)$ 234 days of both crematoria together

Taking into account the presence of children, the number of bodies that could be cremated daily increases by about $\frac{1}{6}$. Hence, there was theoretically enough time to cremate the following number of corpses of alleged gassed victims:

- Crematoria II & III: $(753 \times 360 \text{ corpses/day}) =$ 271,080
- Crematoria IV & V: $(234 \times 192 \text{ corpses/day}) =$ 44,928
- In Total: 316,008

Even though these figures are based on real data, they are merely theoretical, and not just because there was no coke to cremate these hypothetical gassing victims. In reality, another factor influenced the number of possible cremations in a decisive manner: the duration of the muffles’ refractory material.

9. Durability of the Cremation Furnaces’ Firebrick

As a result of thermal stresses, the fireproof brick of a cremation furnace inevitably wears out, and eventually this becomes a serious hazard. In the civilian cremation furnaces which had been constructed in the usual manner and with the building materials normally used in

¹⁷⁷ From March 14 to December 31, 1943, some 22,800 inmates died according to the *Sterbebücher*; some 30,000 more inmates died in 1944, roughly 27,000 to 28,000 of them until the end of October 1944.
¹⁷⁸ *Leichenhallenbuch*. Statistical analysis by Jan Sehn. AGK, NTN, 92, p. 143.

the 1930s, the lifespan of the fireproof lining was about 2,000 cremations, but the Topf Company claimed to have managed to extend its durability to 3,000 cremations,¹⁷⁹ but this referred to the electric furnace in the crematorium of Erfurt, in which the temperature was distributed more evenly, and the stress on the masonry was correspondingly lower than in coke-fired furnaces, resulting in a longer service life.

For the cremation furnaces in the concentration camps, the problem of wear and tear on the fireproof brick was greater, not only because of the lesser mass of this fireproof material and its lower quality, but also because of the greater rate of use of the facility, and also due to its operation by untrained inmate personnel whose hostile attitude to their work may very well have been reflected in the carelessness they showed in performing that work.

The very real impact of these factors is demonstrated by the case of the Topf double-muffle cremation furnace at Gusen. This furnace went into service on January 29, 1941¹⁸⁰ but was already damaged only eight months later. On September 24, the SS Construction Office of the Mauthausen Camp requested the Topf Company to “immediately dispatch one of your furnace specialists to repair the cremation furnace in the Gusen Labor Camp.”¹⁸¹ Topf sent the fitter August Willing, who arrived in Gusen on October 11, and went to work the next day. From the relevant “receipts for special billing re. day-rate jobs” we know that this work took from October 12 to November 9, 1941. During 68 work hours in the week of October 16 to 22, he replaced the fireproof brick of the furnace (“dismantling the furnace, and rebuilding inside”). During 68 work hours the following week, he finished lining the outside brickwork and performed a test cremation. Willing remained at Gusen until November 9 to tune the furnace properly and to supervise its operation.¹⁸²

From February 1 to October 15, 1941, the day of the last cremations before repair works commenced, 2,876 inmates died and were cremated in the Gusen Camp during these 260 days. There were another 14 deaths between January 29 and 31, bringing the number up to 2,890.¹⁸³ This means that 1,445 cremations took place in each muffle – indicating that the life span of the refractory material of a muffle was about 2,000 cremations at best.

Thus, the 46 muffles in the cremation furnaces of Birkenau could have cremated a maximum of $(46 \times 2,000 =) 92,000$ bodies. After that, they would have had to be dismantled in order to replace the firebrick.

If in Crematorium II alone 500,000 people were gassed and burned, as van Pelt would have us believe,¹⁸⁴ the 15 muffles during the period in question $([500,000] \div [15 \times 2,000] =)$ would have had to be renewed 16 times! All this would have generated an immense number of documents, yet the extensive correspondence between the Topf Company or any other competent company and the Auschwitz Construction Office contains no trace of such paperwork. There are not even any indirect references or other clues that would hint at such a mammoth task – with one single exception: a letter from Topf to the SS Construction Office about a wagonload of fireproof material, dated December 9, 1941, indicates that the Construction Office had ordered “one wagonload of firebrick” from Topf.¹⁸⁵ This material, which was enough “for the new construction of one furnace,” was to be used “as replacement material for repair work.” Due to its early shipping date, this material could have been intended only for repairing a furnace at the old crematorium of the Main Camp.

Taking into consideration this restoration of the fireproof brick of two muffles, the six muffles of the Auschwitz I (the Main Camp) were able to cremate a total of 16,000 bodies.

From all this it follows that the furnaces of Auschwitz I and Birkenau (Auschwitz II) altogether were able to cremate an absolute maximum of about $(92,000 + 16,000 =) 108,000$

bodies during the period of their existence. This figure agrees quite well with the number of known, deceased registered inmates.

Thus, the cremation of the supposed gassing victims was physically impossible in technological respects as well.

10. The Number of Cremations in the Crematoria of Birkenau

10.1. The SS Estimate

As quoted before, civil engineer Jährling calculated the coke requirements of the four crematoria of Birkenau in a memo of March 17, 1943, “based on data by the Topf & Söhne Company (builder of the furnaces) of March 11, 1943,” to be 7,840 kg of coke per day, assuming a daily operation time of 12 hours.¹²⁴ The Topf letter mentioned by Jährling has not been located. Since the coke consumption is also a function of the type of corpse cremated, it is preferable to consider the furnaces’ activity times.

On average, the cremation of a corpse took an hour, and it took an additional hour to heat the furnaces to operational temperatures in the morning. This means that 506 bodies could have been cremated within 12 hours in the four Birkenau crematoria (see Subchapter 7.4). From January 1 to March 10, 1943, ca. 14,600 inmates died in Auschwitz, on average 212 per day. In February 1943, the mortality was ca. 7,600 inmates, on average 271 per day.¹⁵⁸ In the same period, according to the *Auschwitz Chronicle* of Danuta Czech, the number of the alleged gassing victims was ca. 72,700, on average 1,054 per day. Therefore, if there had been any homicidal gasings, calculations for coke consumption and hours of operation would have been based upon 1,265 corpses per day. This figure corresponds to 17,963 kg of coke per day¹⁸⁶ compared to the actual estimate of 7,840 kg per day. Furthermore, this would have required an impossible daily operation of (1,265 h ÷ 46 muffles =) 27.5 hours! This shows that Jährling’s calculations referred exclusively to corpses of registered inmates who died a ‘natural’ death. But even this calculation was enormously exaggerated, because between March 15 and October 25, 1943 (224 days), only 607 tons of coke were supplied to the crematoria of Auschwitz-Birkenau, on average 2.7 tons per day, which is only slightly more than a third of Jährling’s estimate. This will be the topic of the next subchapter.

10.2. The Number of Cremations in 1943: Coke Fuel Consumption

The archives of the Auschwitz Museum contain hundreds of receipts documenting deliveries of coke fuel to the crematoria.¹⁸⁷ A member of the museum staff has compiled a per-month list of the quantities specified on each of these receipts, covering the time from February 16, 1942 to October 25, 1943. By means of a calculation, J.-C. Pressac has shown that these deliveries are complete as listed.¹⁸⁸ Since Crematorium II became operational on March 14, 1943 (the other three crematoria followed successively), this date is the starting point of my calculations. The following table lists the monthly coke deliveries starting with March 1943:

MONTH	COKE [METRIC TONS]	MONTH	COKE [METRIC TONS]
March	144.5	July	67.0
April	60.0	August	71.0
May	91.0	September	61.0
June	61.0	October	82.0

¹⁸⁶ See table on page 379 of this article: 15.6 kg/h for Crematoria II & III, 11.7 kg/h for Crematoria IV & V, weighted average: (15.555×30+11.666×16)/46=) 14.2 kg/h; 1,250 × 14.3 =17,754.
¹⁸⁷ Receipt. *APMO*, segregator 22a, sygn. D-Aul-4, No. 12025-12031.
¹⁸⁸ J.-C. Pressac, *Auschwitz...*, *op. cit.* (note 6), p. 224. Piotr Setkiewicz, the current head of the Auschwitz Museum’s historical research department, has shown that this coke documentation may have minor gaps (“Zaopatrzenie materiałowe krematoriów i komór gazowych Auschwitz: koks, drewno, cyklon” [“The Supply of Materials to the Crematoria and Gas Chambers at Auschwitz: Coke, Wood, Zyklon.”], in: *Studia nad dziejami obozów koncentracyjnych w okupowanej Polsce*, Państwowe Muzeum Auschwitz-Birkenau, Auschwitz 2011, pp. 46-74), but the have hardly any effect on our consideration here (see C. Mattogno, *Auschwitz: Le forniture di coke, legname e Zyklon B*, Effepi, Genoa, 2015).

Thus, from March 15 to October 25, 1943, a total amount of 607 tons of coke was delivered to the crematoria. Furthermore, a total of 96 m³ (3,390 cu.ft.) of wood was delivered in the months of September and October. From other documents located by Piotr Setkiewicz we can glean that another 69 m³ of wood were delivered in 1943.¹⁸⁹ These 165 m³ of wood correspond to about 78 metric tons. Since the caloric value of one kilogram of wood is at best that of half a kilogram of coke, 78 metric tons of wood correspond at most to 39 metric tons of coke. Hence, we can equate the caloric value of the coke and wood supplied with a total of (607 + 39 =) 646 metric tons of coke.

From March 15 to October 25, 1943, ca. 16,000 registered inmates died,¹⁵⁸ which means that the coke consumption per corpse was (646,000 ÷ 16,000 =) 40.4 kg. This figure also includes the quantity of coke necessary to preheat the furnaces. In Subchapter 6.3., the importance of this factor on the coke consumption was shown. It will be emphasized here with an example from the furnace at Gusen.

At Gusen 2,890 corpses were incinerated with 138,430 kg of coke over a period of 260 days between January 29 to October 15, 1941, or an average of 47.9 kg of coke per corpse. These cremations were carried out every other day, and in each cycle of cremations 22 bodies were incinerated on average.

Between October 26 and 30, within five days, 129 corpses were cremated, yet this time on a daily basis, with an average of 26 corpses in each cycle and a consumption of 37.2 kg of coke per corpse.

Between October 31 and November 12, in 13 days of operation, 677 corpses were cremated, again with cremations taking place every day, with 52 corpses being incinerated in each cycle; the fuel consumption was 30.6 kg of coke per corpse.

Thus, when going from a discontinuous operation (cremations every other day) with (relatively) few incinerations (22 per day)¹⁹⁰ to a continuous operation (daily) with many cremations (52 per day), coke consumption dropped from 47.9 to 30.6 kg per corpse, *i.e.* to [(30.6 ÷ 47.9) × 100 =] 63.9%, with coke savings of a little over one third,¹⁹¹ an amount used to heat up the furnace when operated discontinuously.

Applying this factor to the coke consumption of the furnaces at Auschwitz-Birkenau for emaciated corpses, so that we obtain the coke consumption per corpse for a discontinuous operation (operation only every second day), leads to the following results:

- Crematorium I: $32.3 \div 0.639 = 50.5$ kg
- Crematorium II & III: $23.0 \div 0.639 = 36.0$ kg
- Crematorium IV & V: $16.0 \div 0.639 = 25.0$ kg

Between March 14 and July 19, 1943, when Crematorium I was shut down for good, 3,050 detainees died in the Auschwitz Camp and were registered in the *Leichenhallenbuch* (the ledger of the morgue in Block 28 at Auschwitz).¹⁹² From March 14 to October 25, 1943, Crematoria II and III were in service for 257 days, Crematoria IV and V for 132 days. From the weighted average of the availabilities of the muffles we obtain an availability of 78% for Crematoria II and III and of 22% for Crematoria IV and V. If we use these figures for a distribution of the cremations, then we get:

- Crematorium I: $16,000 - \approx 3,050 \approx 12,950$ bodies
- Crematoria II & III: $12,950 \times 0.78 \approx 10,100$ bodies
- Crematoria IV & V: $12,950 \times 0.22 \approx 2,850$ bodies

The consumptions of coke were therefore as follows:

- Crematorium I: $3,050 \times 32.3 = 98,515$ kg
- Crematoria II & III: $10,100 \times 23 = 232,300$ kg
- Crematoria IV & V: $2,850 \times 16 = 45,600$ kg
- Total: $376,415$ kg

¹⁸⁹ On this, see my book *Le forniture di coke...*, *ibid.*, p. 32.

¹⁹⁰ It must be kept in mind that this furnace had two muffles, so 22 cremations per day correspond to ca. 11 loadings.

¹⁹¹ $30.6/47.9 = 0.639$. In the intermediate case – numerous, but not many cremations each day, – coke saving would be a little more than ca. $1/5$.

¹⁹² AGK, NTN 92, pp. 141f. (statistic recapitulation by Jan Sehn).

This total corresponds to $(376,415 \div 646,000 \times 100 =) 58.3\%$ of the total supplies during this time, a percentage that is very close to that calculated above for the furnace at Gusen (63.9%). The quantity of coke delivered to the crematoria was therefore fully compatible with a discontinuous cremation of the corpses of the registered inmates who had died a ‘natural’ death.

We will now examine the assumption of homicidal gassings. According to Czech’s *Auschwitz Chronicle*, 116,794 persons were gassed between March 14 and October 25, 1943, or rounded up 116,800. As F. Piper confirms,¹⁹³ no cremations took place in burning pits in the open in 1943 after Crematorium II had been put into service. This means that all corpses of alleged gassings had to be cremated in cremation furnaces.

As shown above, at least 376,415 kg of the total delivery of 646,000 kg of coke was required to cremate the corpses of the 16,000 registered inmates who died a ‘natural’ death during this time, which left $(646,000 - 376,415 =) 269,585$ kg of coke for the cremation of the claimed gassing victims. We assume the most favorable case for the orthodoxy that these cremations were evenly spread out over time (which is very doubtful from a historical point of view), that all victims had normal bodies, and that the consumption decreased by $\frac{1}{6}$ due to the presence of children. This results in the following:

– Crematoria II & III:	$116,800 \times 0.78 \approx 91,104$ bodies $\times (17 \times \frac{5}{6}) =$	1,290,640 kg
– Crematoria IV & V:	$116,800 \times 0.22 \approx 25,696$ bodies $\times (12 \times \frac{5}{6}) =$	256,960 kg
Total:	116,800 bodies	1,547,600 kg

Hence, the cremation of the claimed 116,800 gassing victims would have required at least 1,547,600 kg of coke, but only a maximum of 269,585 kg was available, which would have resulted in $(269,585 \text{ kg} \div 116,800 =) 2.3$ kg of coke per corpse, a quantity that would have been absolutely insufficient to carry out any cremation.

All this points to a plain and simple conclusion: the coke deliveries from March to October 1943 prove indisputably that only the bodies of the inmates who had died of “natural” causes could be cremated in the crematoria.

Therefore, no mass murders took place in Auschwitz and Birkenau in the time from March to October 1943!

11. The ‘Burning Pits’ of Birkenau

11.1. Chief Witness Filip Müller

The most prominent ‘witness’ for this manner of body disposal is Filip Müller, who speaks of five pits located in the northern yard of Crematorium V. His account is quite long-winded; we shall quote the most important points:¹⁹⁴

“[...] the two pits [that had been dug] were 40 to 50 meters long, about 8 meters wide and 2 meters deep. However, this particular place of torment was not yet ready for use by any means. Once the rough work was finished, there followed the realization of the refinements thought up by the arch-exterminator’s [Otto Moll’s] warped ingenuity. Together with his assistant, Eckardt, he climbed down into the pit and marked out a 25 centimeters by 30 centimeters wide strip, running lengthways down the middle from end to end. By digging a channel which sloped slightly to either side from the center point, it would be possible to catch the fat exuding from the corpses as they were burning in the pit, in two collecting pans at either end of the channel.”

After this work was finished, Moll allegedly climbed into the pit to test the slope of the drain channel with a bucket of water. The slope turned out to be inadequate. It is made steeper, and during the next test, the water runs along the channel and flows into a container placed at its end.¹⁹⁵ Müller continues:¹⁹⁶

¹⁹³ F. Piper, “Gas Chambers and Crematoria,” in: Y. Gutman, M. Berenbaum (eds.), *Anatomy of the Auschwitz Death Camp*. Indiana University Press, Bloomington/Indianapolis 1994, p. 164.

¹⁹⁴ Filip Müller, *Auschwitz Inferno: Testimony of a Sonderkommando*, Routledge & Kegan Paul, London 1979, p. 130.

¹⁹⁵ *Ibid.*, pp. 131f.

¹⁹⁶ *Ibid.*, pp. 136f.

“As it began to grow light, the fire was lit in two of the pits in which about 2,500 dead bodies lay piled one on top of the other. Two hours later all that could be discerned in the white-hot flames were countless charred and scorched shapes, their blackish-phosphorescent hue a sign that they were in an advanced stage of cremation. At this point the fire had to be kept going from outside because the pyre which at first protruded about half a meter above the edge of pit had, in the meantime, gone below this level. While in the cremation furnaces, once corpses were thoroughly alight, it was possible to maintain a lasting red heat with the help of fans, in the pits the fire would burn only as long as the air could circulate freely in between the bodies. As the heap of bodies settled, no air was able to get in from outside. This meant that we stokers had to constantly pour oil or wood alcohol on the burning corpses, in addition to human fat, large quantities of which had collected and was boiling in the two collecting pans on either side of the pit. The sizzling fat was scooped out with buckets on a long curved rod and poured all over the pit causing flames to leap up amid much crackling and hissing. Dense smoke and fumes rose incessantly. The air reeked of oil, fat, benzene and burnt flesh.

[...] Some twenty-five bearers were employed in clearing the gas chamber and removing the corpses to the pits. [...] About fifteen stokers had to place the fuel in the pit and to light and maintain the fire by constantly stoking in between the corpses and pouring oil, wood alcohol and liquid human fat over them. There were approximately thirty-five men in the ash team. Some had to dig the ashes from the pits and remove them to the ash depot. The others were busy pulverizing the ashes. [...]

In order to prepare the third pit for cremation old railway sleepers, wooden beams, planks, and sawdust were arranged in layers and covered with a layer of dry fir branches. Then the bearers laid about 400 corpses face upwards in four long rows on top of the fuel. The next layer again consisted of fuel covered, as before, with fir branches. Then followed another layer of corpses. This sequence was repeated once more until, in the end, there were some 1,200 dead bodies in three layers. Meanwhile the stokers had soaked pieces of material and rags in oil and wood alcohol and stuffed them in between the fuel in many places.”

The cremation allegedly took five to six hours:¹⁹⁷

“The process of incineration took five to six hours. What was left barely filled a third of the pit.”

11.2. Scooping up Liquid Human Fat

The flashpoint of animal fats is 184°C (363°F).¹⁹⁸ This means that in the presence of fire or embers, animal fats – and human fat also belongs in this category – ignites at 184°C (363°F). Therefore, burning wood would inevitably ignite any fat exuding from the corpses. This effect is familiar to anyone who has ever barbecued and had major amounts of fat drip from his steak into the charcoal: the entire grill is quickly ablaze. Thus, the set-up described by Filip Müller is outrageous nonsense and would not allow for any scooping of the fat whatsoever.¹⁹⁹

11.3. Real Outdoor Cremations

John C. Ball demonstrates in the present volume that the air photos taken of Auschwitz by the Allies show no traces of mass incinerations outdoors. Aside from the above arguments, we have also explained other reasons that would show mass incinerations alleged to have taken place in deep pits outdoors to be impossible, such as the high groundwater level in Birkenau.²

However, this is by no means to say that no outdoor incinerations were carried out in Birkenau – on pyres or in rudimentary open furnaces.

¹⁹⁷ *Ibid.*, p. 138.

¹⁹⁸ J. H. Perry, *Chemical Engineer's Handbook*, Wilmington, Delaware, 1949, p. 1584.

¹⁹⁹ For more see my monograph on open-air incineration, note 2.

One may reasonably assume that in late 1941, when the mortality rate in Auschwitz rose to frightening proportions, many bodies were taken to Birkenau and buried there in mass graves. According to the Mortuary Book and the Auschwitz *Death Books*, 1,358 inmates and 3,726 Soviet prisoners-of-war died in November 1941, a total of 5,084 people, 169 per day on average. At that time, the crematorium of the Main Camp had only two furnaces whose maximum capacity altogether was 84 bodies per day and which, on top of everything else, had sustained some damage.²⁰⁰ The coke deliveries to the crematorium also prove that only a portion of the deceased inmates could have been cremated. In the following months, the crematorium could just barely handle the cremation of the people who died in the Main Camp. On March 1, 1942, the Soviet prisoners-of-war were taken to Birkenau.²⁰¹ On August 6, the inmates of the Women's Camp, which had been opened on March 26, were also transferred there.²⁰² From March 1, 1942, to February 28, 1943, 14,515 male inmates died in the Main Camp and were registered in the Mortuary Book, and several thousand female inmates also died, but during this same time, only 399.5 metric tons of coke were supplied to the crematorium, which would have sufficed for the cremation of at most some 13,000 bodies. All the bodies of inmates who died in Birkenau were buried in mass graves.

In the following months, the mortality rate rose sharply due to the dreadful typhus epidemic that had gotten out of control in July 1942. As a consequence of this epidemic, the camp commandant, Rudolf Höß, ordered the camp "completely closed off" on July 23, 1942.²⁰³

In other words, bodies buried in mass graves also included many thousands of typhus victims, which made sanitary conditions in Birkenau even more catastrophic, especially if one considers the high groundwater level at Birkenau, which must have swamped the graves quickly. It is easy to believe Pery Broad when he writes – albeit with propagandistic embellishments – that the body toxins of the buried bodies had contaminated the groundwater in the entire area,²⁰⁴ which resulted in the massive death of fish in the lakes surrounding Birkenau, particularly in Harmense.²⁰⁵ And in fact, the pollution by body toxins – not only of the groundwater but also of the soil and the air²⁰⁶ – had been one of the main arguments of the proponents of cremation in the late 19th Century!²⁰⁷

The SS in Auschwitz countered this dreadful sanitary problem in the long run by planning the four crematoria of Birkenau (one of which – the one that was to become Crematorium II – had already been planned in October 1941, but for the Main Camp) and by the installation of efficient disinfestation and delousing facilities (mainly the so-called Zentralsauna), but in the short term by exhuming and burning the bodies.

Little is known about the opening of mass graves and incineration of bodies contained therein. On September 17, 1942, SS-*Untersturmführer* Walter Dejaco, who together with his colleague Hößler had accompanied Camp Commandant Rudolf Höß to Litzmannstadt (Łódź), drew up a "travel report" in which he mentioned that the purpose of the trip had been the "visual inspection of the special facility, and discussions with SS *Standartenführer* Blobel about the implementation of such a facility." If we follow the orthodox interpretation,

²⁰⁰ The Dec. 9, 1941, letter from the Topf Company to the SS Construction Office of Auschwitz mentions "a repair of the two coke-fired double-muffle cremation furnaces" which had already been carried out. *APMO*, BW 11/1, p. 4.

²⁰⁵ Pery Broad, "Reminiscences," in Jadwiga Bezwińska, Danuta Czech (eds.), *KL Auschwitz Seen by the SS: Höss, Broad, Kremer*, 3rd ed., Howard Fertig, New York 1984, pp. 170f. Broad makes the anachronistic claim that the mass graves were opened after the discovery of the graves of Katyn (Feb. 1943).

²⁰⁶ Ptomaines – discovered by Prof. Selmi in Bologna, Italy – are toxic alkaloids forming in dead bodies during putrefaction.

²⁰⁷ "Ground water is even better suited than soil and air to spreading the products of putrefaction; it is all the more dangerous in that the underground watercourses can undergo changes which are not noticeable at the surface." – "The hazards of earth burial increase when the bodies are those of victims of infectious diseases." M. Pauly, *op. cit.* (note 16), pp. 24f.

which I did for a while in the past, this special facility is said to have been a means for incinerating bodies outdoors. Dejaco also reported that the construction materials ordered from the *Ostdeutsche Baustoffwerke* in Posen via “special order by Staf. Blobel” had to be delivered to Auschwitz immediately; and that the firm of Schriever & Co. in Hannover had to supply a “ball grinder for substances.”²⁰⁸ This was supposedly a device for grinding up cremation residues.

On the other hand, the Auschwitz camp authorities were in constant contact with one of Germany’s leading cremation companies and its experts. It is therefore more likely that they would have asked the Topf engineers for help in these matters rather than some SS man (Blobel). In addition, these “special facilities” were evidently solidly built structures – which were never claimed to have been built and used for the outdoor cremations claimed for Auschwitz or any other camps (Belzec, Sobibor, Treblinka). For these and numerous other reasons not to be discussed here, the argument can be made that this “special facility” had nothing to do with corpse cremations at all.²⁰⁹

But be that as it may. According to Danuta Czech’s *Auschwitz Chronicle, 1939-1945*, incineration of exhumed bodies began on September 21, 1942,²¹⁰ which seems quite credible, and ended in November 1942. It is not known how these bodies were burned, but most definitely not in deep burning pits. Mass graves were almost certainly located to the southwest of the “sewage treatment plant,” about 650 ft. west of what was to become Sector BIII of Birkenau, since the air photos from 1944 – specifically those from May 31 – show traces of four huge, parallel trenches in that area. (See the chapter by J. C. Ball, this volume.)

The majority of the inmates who died between September 23, 1942 and the opening of the crematoria were most likely also burned outdoors.

If traces of mass cremations of human beings are in fact found in the vicinity of the former Birkenau Camp,²¹¹ this does not in any way demonstrate that the camp was the site of mass murders.

²¹¹ Udo Walendy, *Historische Tatsachen*, No. 60, Verlag für Volkstum und Zeitgeschichtsforschung, Vlotho 1993, pp. 7-10, discusses an expert report of the Polish firm Hydrokop which conducted some explorative drillings in Birkenau soil and allegedly found such traces.

The Gas Chambers of Majdanek

CARLO MATTOGNO

Introduction

It was in August of 1944 that a Polish-Soviet investigation committee announced the existence of homicidal gas chambers in the Lublin concentration camp known as “Majdanek.” The Polish historians who were responsible for giving credence to ‘findings’ of that committee were confronted with some highly perplexing difficulties; for one thing, the gas chambers which are mentioned in the extant documentation of the Central Construction Office of the Majdanek Camp are invariably designated as “Delousing Chambers” or “Disinfestation Chambers,” and secondly, there are almost no eyewitness reports of human beings being homicidally gassed. Polish historiography ‘solved’ the first problem by presupposing the use of ‘camouflage’ language, which means that documents referring to delousing and disinfestation were said to be referring to homicidal gassings of human beings. Deliveries of Zyklon B to the camp were interpreted in the same way.

As for the other problem, although Polish historiography was not able to offer even one eyewitness to describe the alleged homicidal gassing procedure in a reasonably concrete manner, they managed to cook up an atmosphere of homicidal mass gassings by means of short and extremely vague descriptions of (alleged) homicidal gassings. In this manner, a refined system of argument was created in which the decisive proof of the existence of homicidal gas chambers at Majdanek consisted of merely the existence of facilities which are alleged to have been gas chambers. This principal item of material proof is supported by two auxiliary proofs: eyewitness testimonies (in the sense mentioned above) and deliveries of Zyklon B.

The material proof should in no way be underestimated, since the larger of the alleged homicidal gas chambers, which – according to Polish historiography – was the one most intensively used for criminal purposes, was an authentic Zyklon-B gas chamber, indeed. To this day (or as of this writing), it can be proven easily that cyanide gas was indeed used in these chambers, as their walls exhibit intensive blue staining. Two of the alleged homicidal gas chambers contain special installations which appear to have been used for the introduction of carbon monoxide (CO). The problem is therefore an extremely serious one and requires a thorough investigation of both the remaining documents as well as of the locations concerned.

This present paper,¹ addressing this topic, is intended to provide a definitive answer to the question: **Were there homicidal gas chambers at Majdanek?**

1. Number and Purpose of the Gas Chambers: Polish-Soviet Claims

On August 4, 1944, hardly two weeks after the liberation (*i.e.*, the Soviet occupation) of Majdanek, a Polish-Soviet committee carried out their technical and chemical examination of reported mass-homicidal-gassing installations in that camp. The work was finished on August 23. The Polish-Soviet committee claimed to have located seven gas chambers on the grounds of the camp, accurate drawings of which were prepared.² The most important infor-

¹ This article is an abridged and modified version of Chapters VI to VIII of the book by Jürgen Graf and Carlo Mattogno on the *Concentration Camp Majdanek: A Historical and Technical Study*, 3rd ed., Castle Hill Publishers, Uckfield 2016, pp. 119-209. It is the result of documentation gathered by myself during my second visit to Lublin with Jürgen Graf in June 1997, and takes my original conclusions, expands them, and corrects them as necessary. The photographs were taken by myself.

² Illustration 1 shows Chambers I through IV, prepared by the Polish-Soviet Committee. Source: *Gosudarstvennyj Archiv Rossiskoj Federatsii*, Moscow (henceforth GARF); 7021-107-9, p. 251.

mation on these premises is summarized in the following table, with designations supported by documents in italics:

LOCALITY	POSITION & DESIGNATION	DIMENSION [M]	SURFACE Area [m ²]
Chamber I	Hut 41, <i>Disinfestation installation</i> SE	4.50 × 3.80	17.1
Chamber II	Hut 41, <i>Disinfestation installation</i> NE	4.50 × 3.80	17.1
Chamber III	Hut 41, <i>Disinfestation/Delousing</i> W	9.27 × 3.80	35.2
Chamber IV	Hut 41, <i>gas chamber</i> adjacent to shower room		72.2 ³
Chamber V	Hut 28, Drying installation	11.75 × 6.00	70.5
Chamber VI	Hut 28, Drying installation	11.75 × 6.00	70.5
Chamber VII	New crematorium, room between morgue and dissection room	6.10 × 5.62	34.9
Cell 14	Hut 41, <i>Disinfestation installation</i> , cell fronting Chambers I and II	2.15 × 1.73	3.7

In their conclusions, the committee stated that Chambers I, II, III, IV and VII, had been planned and built for mass homicidal extermination, while Chambers V and VI could have been used as disinfestation chambers, but were used exclusively to disinfest the clothing of murdered camp inmates. Furthermore, in barracks used for stocking chemical products, the committee found the following 52 objects:

- a. five empty steel cylinders for carbon monoxide;
- b. one can with a carbon monoxide filter from AUER Company A.G. of Berlin;
- c. 135 Zyklon B canisters with a capacity of 500 grams each, as well as 400 cans, each with a capacity of 1500 grams; 90% of these cans were empty.

The committee also prepared a chemical report on these objects in order to establish what they actually contained. Chemical reaction tests showed that the contents did actually correspond to what the labels stated: carbon monoxide in the cylinders and hydrogen cyanide in the cans.⁴

2. Planning, Construction, and Purpose of the Gas Chambers

The remaining documents prove exactly the opposite of the conclusions put out by the Polish-Soviet Committee: *all* gas chambers of Majdanek Camp were planned and built exclusively for sanitary purposes as disinfestation chambers.

A blueprint of the Central Construction Office of March 23, 1942,⁵ provided for three delousing installations. One was an H-shaped installation in the center of the Majdanek PoW Camp (Majdanek was originally known as a “Prisoner of War Camp,” and was called “Lublin Concentration Camp” after April 1943). The H-shaped installation was designated “Delousing” and is located next to the large laundry. A second one was a barracks, also designated “Delousing,” and was located outside the camp on the north-west side. The third was located in that part of the camp which was designated as “Clothing Factory for the Waffen SS,” as may be seen from the detailed plans.⁶

The H-shaped installation in the Lublin Camp was planned in October 1941, which was the month when the first prisoners arrived at Majdanek. The plan drawn up by the Hans Kori Corporation projected a large hygienic-sanitary complex which was to consist of two exactly identical delousing installations; one for the prisoners lay on the left wing; the other, consisting of eight clothing delousing chambers, stood on the right.

³ Without vestibule (6.7 m²) or interior area (28.2 m²).

⁴ GARF; RF, 7021-107-9, 229-243.

⁵ Józef Marszałek, “Geneza i początki obozu koncentracyjnego na Majdanku,” in *Zeszyty Majdanka* (*Magazine of Majdanek*, hereinafter *ZM*) I, 1965, “Kriegsgefangenenlager Lublin” (POW camp Lublin), camp map of 23 March 1942 (table without page numbers).

⁶ *Ibid.*, “Bekleidungswerk der Waffen-SS Dachau Außenstelle Lublin,” March 1942 (table without page numbers).

The inmate delousing installation appears on drawing J.-Nr. 9082 which is dated October 23, 1941, and is prepared by the Kori Corporation.⁷ It is described in a letter that was sent by that corporation on that same date to SS *Sturmbannführer* Lenzer.⁸

As may be seen from the description and the annexed plan, the left wing of the structure was planned for inmate delousing, and provided for the following procedure: undressing room with acceptance of clothing – vestibule – shower room – drying room – vestibule – disinfection. After complete disinfection,⁹ the inmates entered the right wing where they received deloused clothing.

The delousing installation, which was projected as per the Kori letter cited above, was to consist of eight delousing chambers. Each of them was to be two meters wide, 2.10 meters high, and 3.5 meters long. They were to be heated by a coke-fueled air heater located behind the two outside walls between every pair of chambers. A warm air outlet was to be built into the upper part of every interior wall and linked to the air heater. In front of the opposite wall in the floor of every pair of chimneys was to be a ventilation opening also linked to the air heater through an underground air shaft, thus providing air circulation. These delousing chambers were planned only for the use of hot air and not for Zyklon B. However, this delousing installation planned by the Kori Corporation was never built.

A plan from the Central Construction Office of March 31, 1942, showing the “Provisional Delousing Installation of Lublin PoW Camp”¹⁰ shows eight delousing chambers of considerably smaller size and without air heaters. In all probability these are disinfestation devices made of steel such as were installed in Buildings BW 5a and 5b at Birkenau.

This plan shows the eight small cells next to each other in a room labeled “Delousing” measuring 13.5 m × 4 m and located inside a hut measuring 40.76 m × 9.56 m. This cell block separated the “clean” side of the building adjacent to the showers from the “unclean” side facing the outside. The processing of the inmates provided for the following sequence: entry/registration – undressing/shower room – showers – dressing rooms – exit. The clothing followed this cycle: surrender of clothing – delousing (“unclean” → “clean”) – the acceptance of clean clothing. The shower room was designed for 40 showers; the hot water

⁷ “Entlausung und Krematorium” (Delousing and crematorium), Drawing J. No. 9082 of the H. Kori corporation, Berlin, October 23, 1941. *Archivum Panstwowego Muzeum na Majdanku* (hereinafter APMM), sygn. VI-9a, Vol. I, p. 9.

⁸ *Ibid.*, p. 1.

⁹ The disinfection was carried out with water containing chemical substances in solution. See Walter Dötzer, *Entkeimung, Entseuchung, und Entwesung*, working instructions for clinics and laboratory of the Hygiene Institute of the Waffen SS, Berlin. Published by the SS *Standartenführer* Dozent Dr. J. Murgowsky. Verlag von Urban und Schwarzenberg, Berlin and Vienna 1943, pp. 48 ff.

¹⁰ Zentralbauleitung der Waffen-SS u. Polizei Lublin/GG., Prov. Entlausungsanlage K.G.L. Lublin, March 31, 1942, *Wojewodzkie Archiwum Państwowe w Lublinie* (hereinafter WAPL), Zentralbauleitung, 41, p. 5.

came from a boiler room. This is what the delousing installation located outside the camp looked like on the original plan dated March 23, 1942. As far as one can tell by looking through a window of the building, which has (otherwise) been made inaccessible to visitors,¹¹ the plan – with a few modifications – was actually carried out in Hut 42 (BW XII). This building contains the boiler room as well as a chamber finished in concrete which is much bigger than the building shown on the plan.

According to a report from the Central Construction Office, BW XII was 40% completed on July 1, 1942. The report states:¹²

“BW XII Delousing and Bath – to this, a second horse-stable hut with shower bath installation was added.”

This second installation, to which I will return in the following section, was Hut 41, which was built to the east, next to Hut 42.

On June 19, 1942, SS *Sturmbannführer* Lenzer, who was head of the Central Building Inspection Office of the SS WVHA,¹³ forwarded a request dated May 27 from Office BII of the SS WVHA, to the Building Inspection of the Waffen SS and Police of the General Government regarding the construction of a delousing installation for the Garment Workshops in Lublin “according to the system of disinfestation with hydrogen cyanide.”¹⁴

On July 10, 1942, the head of the Central Construction Office sent all the administrative documentation to the Building Inspection of the Waffen SS and Police of the General Government. The documentation included in particular: the initial assignment, the explanatory report, the construction notice, the cost calculation, the situation map scaled to 1:500, and the drawing of the disinfestation barracks. The cover letter states:¹⁵

“Following the instructions of the decree of 27 June 1942, the supplement to the planning application for the construction of a disinfestation installation as Building XII in the Fur And Garment Workshops Lublin for the sum of 70,000 RM (Reichsmark), with a request for review and allocation of the funds and raw material quotas is hereby enclosed as an attachment. The basis of the cost calculation were the prices of Polish contractors.”

Of the documentation accompanied by this letter, only the explanatory report and the cost calculation remain, which were both drawn up dated July 10, 1942, by the head of the Central Construction Office. The first document, given here in its entirety, explains the purpose of the installation:¹⁶

“Explanatory Report

*on the Construction of a Disinfestation Installation
for the Fur and Garment Workshops Lublin.*

A disinfestation installation for the disinfestation of all incoming fur and garment materials is to be built in the area of the Fur and Garment Workshops Lublin according to the drawings sent by the SS Economic and Administrative Main Office. The disinfestation chamber is to be built solidly with a reinforced concrete ceiling, as may be seen from the enclosed drawing. A so-called flying roof has yet to be built above this delousing chamber. The flying roof is to cover a surface area of 60.0 × 18.0 m, so the disinfested materials can be laid out and stored. The stove as well as other devices will be made available by Office BII.

Everything else can be gleaned from the drawing.”

The “cost estimate on the construction of a disinfestation hut for the Fur and Garment Factories of Lublin” consists of 27 sections, and lists a total cost of 140,000 Zloty (Polish currency). Section 18 states:¹⁷

“Install 4 pieces of air-tight iron doors, to be delivered by client, with the help of the locksmith, including all mortise and plaster work.”

¹¹ This barrack is closed off by a padlock, so the curious must peep through windows.

¹² WAPL, Zentralbauleitung, 8, p. 3.

¹³ Amt C/V, Zentralbauinspektion.

¹⁴ WAPL, Zentralbauleitung, 141, p. 3.

¹⁵ *Ibid.*, p. 2.

¹⁶ *Ibid.*, p. 5.

¹⁷ *Ibid.*, pp. 7f.

The original plan, of which an as-finished drawing has survived – the Construction Office drawing “PoW Camp Lublin Disinfestation facility, Building XII A”¹⁸ – shows a rectangular block measuring 10.76 m × 8.64 m × 2.45 m in size, containing two disinfestation chambers measuring 10 m in length, 3.75 m in width, and 2 m in height. Every chamber has two doors in opposite walls measuring 0.95 m in width and 1.80 m in height, so that both of the building’s shorter walls contains a pair of doors three meters apart. Above the block with the two disinfestation chambers there is a flying roof, also rectangular in shape and measuring 18 m × 60 m in surface area and divided in the middle into two large halves, equal in size, and corresponding to the “unclean” and “clean” sides. The “clean” half, on the smaller side of the block between the two doors of the disinfestation chamber, contains a coke-fueled stove installation structurally resembling the Kori air heaters described earlier. The stove is sunk to a depth of 0.66 m, and on the lower part exhibits a filling door and firing door which is accessed by means of 4 steps. The smoke exhaust pipe has been installed in the upper part. Since the disinfestation installation utilized hydrogen cyanide, this stove warmed the air and sped up the circulation of the air-gas mixture.

Construction of the installation followed this plan, except for the heating system:¹⁹ the stove in the middle was replaced by two hot-air devices which were manufactured by the firm Theodor Klein Maschinen- und Apparatebau Ludwigshafen, and were ordered by the Central Construction Office on September 11, 1942.²⁰ One was installed in the western exterior wall of the disinfestation chamber (designated as Chamber III in the Polish-Soviet report); the other, as we shall see in the following chapter, is associated with the “gas chamber” in Hut 41.

The Klein hot-air apparatus was a coke-fueled air heater capable of generating heat at 80,000 Kcal/h, raising the air temperature to 120 degrees Celsius. The air temperature was regulated by the air throttle as well as by specially designed air intakes, bringing cool air from the outside into circulation.²¹ For delousing with Zyklon B gas, if the air temperature was adjusted to a lower level, the air heater fulfilled the same function as the DEGESCH circulation system.

An air heater very similar to the one described above was installed in the autumn of 1942 in BW 20 of the Auschwitz Concentration Camp (protective custody camp).²²

On October 22, 1942, the head of the Central Construction Office sent a report to the SS Economist of the Superior SS and Police Leaders (*SS-Wirtschaftler des Höheren SS- und Polizeiführer*) in the General Government on the state of progress of the work in the various construction projects at the camp. Among the projects carried out at Lublin PoW Camp was the construction of:

“2 delousing huts with baths, built partly on wooden poles and partly on solid foundations.”

With regards to the construction project for the Fur and Garment Workshops Lublin, the report presents “the construction of a disinfestation installation” among the completed projects. The “installation of four disinfestation chambers” is mentioned among the projects remaining to be completed after 1 November.²³ The disinfestation facility was installed next to Hut 41 and consisted of two disinfestation chambers, *i.e.*, BW XII^A.

As may be seen from the previously quoted Central Construction Office report on “completion of the construction in % [*i.e.*, expressed as a percentage of completion] on July 1, 1942,” these two delousing huts mentioned among the PoW-camp construction projects involved Huts 42 and 41. However, this document refers to Hut 41 as merely a “horse-stable

¹⁸ Bauleitung des KGL Lublin, *Entwesungsanlage Bauwerk XII^A*, Lublin, August 1942. WAPL, Zentralbauleitung, 41, p. 4.

¹⁹ The dimensions of the other rooms were also changed: the Polish-Soviet Committee gives them as 9.70 m × 3.70 m, while the Polish reports give them as 9.27 × 3.80 m.

²⁰ Józef Marszałek, “Budowa obozu koncentracyjnego i ośrodka masowej zagłady na Majdanku w latach 1942-1944,” in *ZM*, IV, 1969, pp. 21-90, here p. 53, footnote 117.

²¹ Instytut Technicki Ciepłej, Ekspertyza dotycząca konstrukcji i przeznaczenia pieców zainstalowanych przy komorach gazowych w Obozie na Majdanku w Lublinie, Łódź 1968, APM.

²³ WAPL, Zentralbauleitung, 8, p. 22.

hut with shower bath installation,” which means that a delousing installation must have been installed there over the following months.

This installation is also referred to in a cost estimate dated November 18, 1942, from the Polish firm Michael Ochnik Construction Contractors Lublin for brick work on two large chimneys measuring 0.75 m × 0.70 m × 1.70 m “in the Gas Chamber,” including piercing a hole (*aushauen*) in the concrete ceiling, for the Fur and Garment Workshop at a cost of 285 Zlotys.²⁴

On January 8, 1943, Michael Ochnik sent the Central Construction Office a corresponding invoice relating to the “Waffen SS Garment Workshop in Lublin”:²⁵

“For laying brick work for chimney, and connecting ducts from two sides to the chimney in the gas chamber inside the brick building. Piercing two openings in the concrete ceiling, brick work for chimney measuring 0.75 × 0.75 × 1.70 m.”

In fact, two openings measuring approximately 60 cm × 60 cm and 40 cm × 40 cm, located 4 m apart, are still in existence in the ceiling of the above-mentioned room today. According to the invoice mentioned above, two ducts were installed in these two openings leading to a central chimney measuring 0.75 m in diameter and 1.70 m in height.

The disinfestation facility inside BW XII^A obviously proved insufficient for the requirements of the Fur and Garment Workshops Lublin, since, as already stated, the Central Construction Office planned the construction of four additional disinfestation chambers for this same construction project. Two civilian firms, the above-mentioned Michael Ochnik Construction firm in Lublin, and Polstephan Bauunternehmung GmbH (constructing contractors), a Warsaw corporation, were assigned by the Central Construction Office to complete the work consisting of converting an already existing building into a disinfestation installation.

Both firms presented a “cost estimate for the construction of four disinfestation chambers in an existing building of the former Army Motor Pool.” The cost estimate of the Ochnik firm, dated November 7, 1942, quoted a total of 8,855 Zlotys,²⁶ while Polstephan’s estimate, submitted on November 10, 1942, quoted a total of 10,345 Zlotys.²⁷ It is clear from both documents that the four disinfestation chambers were to be equipped with “cast-iron doors” measuring 0.83 m × 1.93 m. Each chamber was to be connected to a “disinfestation furnace” – also called a “gas furnace” – to be protected by a catslide roof.²⁸

3. The Use of the Gas Chambers for Homicidal Purposes

In the section above, I have shown that the actual gas chambers of Majdanek were planned and built exclusively for hygienic-sanitary purposes. It would of course have been theoretically possible to convert them to homicidal purposes at a later time. That possibility will be examined in this section from a technical point of view.

In his response to the *Leuchter Report*,²⁹ Jean-Claude Pressac provided a detailed and, in parts, rather astute analysis of the gas chambers at Majdanek.³⁰ That analysis represents an excellent starting point for the discussion below. The following discussion will, however, adopt the numbering of the premises used by the Polish-Soviet Committee, with the addition of Chamber IIIa. The term “Chamber IIIa” is intended to refer to the eastern delousing chamber in BW XII^A before it was divided into Chambers I and II.

3.1. Chambers I-III

Jean-Claude Pressac, who demonstrates no expert knowledge about the origins and development of this installation, presents historically unfounded hypotheses. He believes that the second air heater was initially installed in the other room of the disinfestation installation (i.e., Chamber IIIa), and that both chambers originally functioned as hot air disinfestation chambers. They are assumed to have been converted into hydrogen-cyanide gas chambers at a later time, due to practical difficulties in use.³¹

As seen in the section above, however, the disinfestation chambers of the installation adjacent to Hut 41 were initially designed “according to the hydrogen-cyanide disinfestation system,” so that, in reality, there was never any question of converting a hot-air installation into an HCN installation, but rather, at most, the other way around. We will return to this question later.

According to J.-C. Pressac:³²

“A final conversion of the block led to the creation of gas chambers in which people were killed with carbon monoxide. There cannot be the slightest doubt that this installation served criminal purposes, since carbon monoxide is, of course, deadly to warm-blooded animals, including human beings, but it is totally useless in fighting lice.

Location B [= Chamber IIIa] was divided into two rooms equal in size, which I have called B1 [= Chamber I] and B2 [= Chamber II]. Only B1 possessed a system for the introduction of carbon monoxide. This system consisted of perforated metal pipes running along three sides of the room 30 cm above the floor. These pipes were originally connected to steel cylinders containing liquid carbon monoxide. An exterior side room was built in the middle of the western [correct: southern] side of the block. This room contained two cylinders of carbon monoxide (the second container was intended for Room A [= Chamber III]), as well as a glass peephole protected by an iron grid. Homicidal gassings could only be observed in Room B1. No corresponding installation was built in Room B2. An opening was made in the ceiling of both chambers, newly obtained with the above division. The stove formerly used to heat Room B [= Chamber IIIa] was now no longer needed, and was removed and re-installed on the southern [correct: eastern] wall of Room C. That this Room B was only divided after its use as a Zyklon B gas chamber is shown by the fact that its walls, one of which is divided in two parts by the partition, are saturated with blue stains. The partition itself exhibits no blue pigmentation at all.

As to Room A, it was also equipped for the introduction of carbon monoxide, which came from the second steel cylinder located in the exterior room. The installation consisted of a pipe (smaller in diameter than in room B1), running along the southern wall [= eastern wall] and 30 cm above the floor. The gas flowed through perforated metal plates at both ends of the pipes, located in the corners of the room. No openings were made in the ceiling, and it was not possible to view the inside of the chamber from the side room.

Whether rooms A, B1, and B2 were used as hydrogen-cyanide gas chambers for homicidal purposes, is a question which is difficult to answer and must remain open. In rooms B1 and B2, the Zyklon B granules were supposed to have been poured through the openings pierced in the ceiling. In so far as I have been able to determine, no eyewitness has ever reported seeing an SS man climb up onto the roof by ladder. The ventilation of these two rooms, measuring 36 m³, must have been very time-consuming due to the absence of any openings, apart from the opening in the ceiling as well as the doors, and because of the absence of artificial ventilation.

The introduction of Zyklon B into Room A would have involved difficulties, described by one historian of the Majdanek Museum as follows: ‘The Zyklon was introduced, not through an opening in the ceiling as in the previous chamber [B1] – there was no such opening – but rather through the doorways before closing the doors.’ Frankly speaking, it is unrealistic to imagine an SS man wearing a gas mask and with a can of Zyklon B in his hand, throwing the granules in the 30 cm space between the heads of the victims and the ceiling (involving the risk of the granules falling on to the floor at the front of the room)

³¹ *Ibid.*, pp. vii, viii.

³² *Ibid.*, pp. vii-ix.

while attempting to close the door, without causing desperate escape attempts on the part of the victims.

For this reason, I do not believe that Room A could be used for homicidal purposes using Zyklon B. Although this does appear technically possible in Rooms B1 and B2, it is unlikely that these premises were really used for this purpose. It rather appears that the SS wished to have two different carbon monoxide gas chambers available (A and B1), which were used for different-sized groups of victims: Chamber A (36 m²), for groups of 250 to 350 people, and Chamber B1 (18 m²), for groups of 125 to 175 people. These figures are repeatedly mentioned by survivors giving the strength of the transports sent into the gas chamber. Finally, the openings in the ceiling of Rooms B1 and B2 probably served to accelerate ventilation, rather than for the introduction of Zyklon B. This assumption only applies to B1. B2, despite the opening in the ceiling, appears to have played merely a passive role as a 'dead room' in the division of the block for homicidal purposes.

Upon the liberation of the camp, the flying roof protecting the block was partially damaged. The side room was empty. Zyklon B cans were initially piled up there to give the impression that their contents could have been poured into the pipes of room B1 (instead of through the opening in the ceiling). Five carbon-monoxide steel cylinders were found in the camp. After chemical analysis of their content, two of them were housed in the side room."

Let us stress once again that Pressac of course considers the use of Zyklon B for homicidal purposes to be possible in theory, but in practice however, he rules out this possibility for Chamber III, and considers it "unlikely" for Chambers I and II.

I have no choice but to concur with Pressac's arguments, with the following additional considerations. If the camp authorities had wished to use both disinfestation chambers *also* – but not exclusively – for homicidal purposes, they would have made an opening in the ceiling for the introduction of Zyklon B in both rooms. The absence of such an opening excludes utilization of Chamber III for such purposes for the reason stated by Pressac. In Chambers I and II, the existing openings are so small (26 cm × 26 cm and 29 cm × 33 cm respectively; see Illustrations 2 and 3), that they would have been hardly able to accelerate the ventilation, contrary to the view expressed by J.-C. Pressac. Furthermore, these openings were broken through the ceiling in an extremely unprofessional manner, especially in Chamber II, where there is not even a wooden frame for the introduction of Zyklon B. Everything indicates that these openings were hastily broken through the ceiling simply for purposes of the Polish-Soviet Committee.

It is highly revealing that the Soviet journalist Constantin Simonov, correspondent for the Red-Army newspaper *Red Star*, who visited Majdanek immediately after the liberation, mentions the openings in the ceiling of the delousing chamber in Hut 42, but not the opening in Chamber I, which he examined immediately afterwards.³³ The inevitable conclusion is that this opening did not exist at that time.

We must now turn to the division of Chamber IIIa into two chambers, and the alleged conversion of Chambers I and III into carbon monoxide gas chambers. Pressac has no doubt as to their use for criminal purposes, but his certainty is based upon pure hypothesis – *i.e.*, that the installation was actually utilized with carbon monoxide. In fact, the statements of the Polish-Soviet Committee relating to the use of the premises for homicidal carbon-monoxide gassings are not in fact based on any evidence at all. Two facts quite clearly indicate the contrary.

First, immediately after the liberation of the camp – as correctly emphasized by Pressac – there were no containers in the cell in front of both chambers, but rather, there were Zyklon B cans brought there by recently liberated inmates to give the impression that people had been murdered in these rooms by pouring Zyklon B through the pipes. This will be discussed in detail below.

Secondly, two of the five steel cylinders found by the Soviets in Hut 52 were later set up in Cell 14. The report of the Polish-Soviet Committee alleges that these five containers had

³³ Constantino Simonov, *Il campo dello sterminio*, Foreign Language Publication House, Moscow 1944, p. 8.

Illustrations 2 + 3: Openings in the ceiling of Chambers 1 (top) and 2 (right) of the delousing facility next to Hut 41 at Majdanek (cf. map, Illustration 1). © C. Mattogno

contained CO. But one of the two containers visible in Cell 14 today bears the inscription “CO₂” embossed in the steel, *i.e.*, carbon dioxide.³⁴ It is well known that carbon dioxide is not a toxic gas.

These plain facts permit two important conclusions: first, if one of the five carbon-monoxide cylinders really contained carbon dioxide, the suspicion arises that the other cylinders contained carbon dioxide as well, and that the Polish-Soviet Committee is guilty of deception on this point, just as on a number of other points.³⁵ Secondly, even if the other cylinders actually contained carbon monoxide, there is still no proof that the installations involved were actually utilized for carbon monoxide rather than carbon dioxide. This alone suffices to cast doubt on the alleged criminal use of these installations.

The Auer filter found in the chemicals warehouse by the Committee corresponds very exactly to the description of a carbon-monoxide filter, with regard to both size and the manner in which it was stored. A specialist in the field of toxic gasses summarizes these matters as follows:³⁶

“A common defect of the various filters especially designed to provide protection against carbon-monoxide gas lies in the remarkable hygroscopicity of the absorbing substances: this alters the distribution of the filtering and absorbent materials in the filter, which restricts their usefulness in a moist environment, and leads to strict measures for the conservation of the filter itself to prevent premature depletion due to moisture. The filters are stored in hermetically sealed boxes before use.”

With regards to the filters under discussion here, these strict conservation measures appear to have been fully and entirely adhered to. They were kept in a hermetically sealed metal box with the following inscription (re-translated from Russian):

“AUER Filter No. 09903. Do not use after June 1944. Can be used for two years from date of first use. No more than 40 hours working life.

Initial use:

Date:

Use:

Hours:

From:

To:

³⁴ “Dr. Pater Victoria Kohlensäurefabrik Nußdorf Nr 6196 Full. 10 Kg [...] und Fluid Warszawa Kohlensäure [...] Fluid Warszawa Lukowski. Pleschen 10,1 kg CO₂ Gepr.” (The inscription was only partially legible).

³⁵ The suspicion is all the more justified, as the other three bottles are no longer found on the camp grounds. We do not know where they ended up. The Committee’s most primitive deception is the technical report on the cremation furnaces: the coke-fueled Kori five-muffle furnaces, by means of a completely crack-brained series of calculations, are said to have possessed a crematory capacity of 1,920 bodies per day, nineteen times the actual capacity: GARF, 7021-107-9 pp. 245-249.

³⁶ Attilio Izzo, *Guerra chimica e difesa antigas*, Editore Ulrico Hoepli, Milan 1935, p. 183.

Attention: After each use, seal the box tightly, top and bottom. Store in a cool dry location."

Since the spaces for "Date" and "Hours" were left blank, we must assume that the filters were still unused. The camp doctor, who was responsible for the storage of gas-protection material, would certainly never have permitted use of the filter without completion of the required information on the label.

On the other hand, this same type of carbon monoxide filter was versatile by nature, and provided protection against other gases as well, such as ammonia, benzene, chlorine, phosphene, sulfur dioxide, hydrogen sulfide, and carbon tetrachloride. It could also be used to protect against hydrogen-cyanide gas: the Degea CO filter could absorb 6 grams of HCN, and the Dräger CO filter 3.3 grams.³⁷ Thus, the presence of such a filter in no way proves that it was intended to provide protection against carbon monoxide.

Pressac's hypothesis appears unfounded, even viewed historically. He believes in particular that the installation of pipes in Chambers I and II took place at the end after both rooms had been used first as hot-air disinfestation chambers, and were then used as Zyklon-B delousing chambers. But the pipes fastened along the entire length of the eastern wall of Chamber III are skirted by intensely blue-pigmented plaster, as if they had acted, in a certain sense, as the catalyst for the formation of iron blue (ferric-ferrocyanide; see Illustration 7). In Chamber I, on the other hand, no traces of blue pigmentation are to be seen. In Chamber II, blue stains are visible only on the eastern wall between the door and the interior partition in the middle as well as on the lower part of the partition itself, *i.e.*, corresponding to the very places where the pipes are located in the adjacent room.

This leads to the conclusion that HCN was used in Chamber III *after* the installation of the pipes, while no HCN was used in Chamber IIIa at all. The iron blue stains are too small, and are only located at certain places in Chamber II, so that they are certainly the result of the phenomenon of cyanide diffusion, corresponding to the diffusion of cyanide to the outside of the northern wall.³⁸

Chamber IIIa was divided into Chambers I and II even before the disinfestation installation was put into use, indicated by the fact that the air heater was not installed there as planned. In fact, the eastern walls of Chambers I and II show no trace of the circular openings for the warm air outlet and ventilation intake, as found in the western wall of Chamber III.

From the above, it can be seen that Pressac's hypothesis as to the use of these areas for criminal purposes is based on fallacious premises from the very outset; it also makes no sense on purely technical grounds: Despite the availability of two *real* hydrogen-cyanide gas chambers which could have been converted for homicidal purpose by merely piercing holes in the ceiling for the introduction of Zyklon B, SS men are supposed to have installed early on a contraption for homicidal gassings using carbon monoxide – but what for? If homicidal gassings with Zyklon B worked perfectly at Auschwitz, as we are told they did, then why use carbon monoxide at Majdanek?

From the technical point of view, Pressac's explanation, that Chamber IIIa was divided into two rooms to be used as gas chambers, one of them to gas small groups, and the other to gas large groups, is quite nonsensical. Not only did division of the chamber offer no advantages (groups of 125-175 victims could have been gassed quite easily in the larger chamber without any considerable waste of gas), it actually made the gassing procedure much more difficult. First, the partition obstructed the natural ventilation of Chamber I and II after opening the doors, which are located opposite each other. On the other hand, Chamber II was demoted to a "dead room," as Pressac himself had to admit.

The small window in the southern wall of Chamber I raises additional, unsolvable problems. In its present condition, it is barred by a grid, but there is no installation for hermetic sealing (see Illustration 4). After the liberation of the camp, as reported by Simonov, as well as by the Polish-Soviet Committee, it was fitted only with a pane on the observer side of Cell 14. If this is true, the pane was not initially built in, but was rather merely shoved into

³⁷ Ferdinand Flury, Franz Zernik, *Schädliche Gase, Dämpfe, Nebel, Rauch und Staubarten*, Verlag von Julius Springer, Berlin 1931, p. 617.

³⁸ This phenomenon is also visible, but more intensely, on the outside walls of the disinfestation chamber in BW 5a and 5b at Birkenau.

the window, which shows no trace of a frame or attachment clamps for such a pane. The window pane was therefore not only incapable of being hermetically sealed, it was even capable of removal. Furthermore, it could have easily been smashed by the inmates, since the walls are only approximately 40 cm thick, because the grid is large enough to stick one's hand through. Finally, it is impossible to understand why such a window, if it was intended to permit observation of homicidal gassing victims, would have been necessary for Chamber I, but not for Chamber III.

Utilization of carbon monoxide may therefore be excluded. But it remains to be explained why the room was divided into two chambers. In the absence of any documents, we can only form one more hypothesis, but one which is incomparably more plausible than Pressac's hypotheses. Since one of the two containers is CO₂, and in view of the date of conversion, the following explanation appears far more plausible:

Starting in July 1942, 'natural' mortality in the camp was devastating, so much so that 2,431 inmates died in September, and 3,210 in October.³⁹ The "old crematorium" then in existence possessed only two (oil-fired) furnaces, which could no longer handle the constantly increasing number of victims. There was also a petroleum shortage. As reported by crematorium director SS *Oberscharführer* Erich Mußfeldt, this finally led to closure of the crematorium in November of the same year.⁴⁰ Furthermore, the camp's morgue, BW XIV,⁴¹ was a half-underground hut of rather modest size, measuring 11.50 m × 6.50 m on the outside,⁴² so that it could store only a limited number of bodies at one time. In this desperate situation, the Central Construction Office decided to convert the disinfestation installation adjacent to Hut 41 into two additional morgues. One of these (Chamber III) was to be temporary, while the other (Chamber I) was to be permanent in nature. Pipes connected to a container of CO₂ permitted both rooms to be cooled⁴³ to the desired temperature.⁴⁴ CO₂ also has the property of retarding oxidation processes, thus delaying the decomposition of corpses.

When not needed as a temporary morgue, Chamber III could still be used for its original purpose – hydrogen-cyanide-gas disinfestation. That it was so utilized, is proven by the intense blue pigmentation, *i.e.*, the presence of high concentrations of iron blue in all the walls of this room.

As for the little window in the southern wall of Chamber I, there is no proof that it was built at the time of the installation of the pipes in Chambers I and III. Since these rooms lost their purpose as auxiliary morgues with the opening of the new crematorium in January

Illustration 4: Unsealable opening with nothing more than a grate links Chamber I to the small attached room, Hut 41, Majdanek Camp (cf. map, Illustration 1). © C. Mattogno

³⁹ *Księga więźniów zmarłych na Majdanku w 1942*, APMM, sygn. I-d-19; *więźniów zmarłych w obozie na Majdanku*, AGKBZH (Archivum Głownej Komisij Badania Zbrodni Hitlerowskich w Polsce) 626 z/OL3. The figure for October is calculated by subtraction. The question of the number of deaths in the camp of Majdanek is discussed in Chapter IV of the book cited in footnote 1.

⁴⁰ Anna Zmijewska-Wiesniewska, "Zeznanie szefa krematorium Ericha Musfeldta," in *ZM*, I, 1965, pp. 133-148, hier p. 140.

⁴¹ On July 1, 1942, this building was already 70% finished, WAPL, Zentralbauleitung, 8, p. 3.

⁴² These data have been taken from the corresponding blueprints: K.G.L. Lublin, Leichenhalle, Bauwerk XIV, scale 1:100. WAPL, Zentralbauleitung, 47, p. 14.

⁴³ It is well-known that the expansion of compressed and liquid gases causes a drop in room temperature. This could also explain why iron blue preferentially developed around the pipes: their cooling effect increased the wall's moisture and thus promoted the formation and accumulation of blue iron-cyanide compounds.

⁴⁴ The door of room III shows an opening for the introduction of a thermometer.

1944, a new purpose was no doubt assigned to them. In view of the chronic shortage of Zyklon B, Chamber III was probably used as a hot-air-disinfestation chamber using the air heater. Chamber I could have been used as a storage area for material requiring visual supervision (such as, for example, weapons or ammunition).

3.2. Chamber IV

Regarding this room, Pressac writes:⁴⁵

“The use of this room for homicidal purposes is only conceivable under two sets of circumstances: removal of the little window, which the inmates would have smashed instantly, and the incorporation of mechanical ventilation. After a delousing action, opening the two doors would have created a draught of air carrying toxic vapors into other parts of the hut. It was therefore indispensable that the door leading to the shower room remain hermetically sealed. But if the ventilation only took place in the area between the two upper openings and the door, such ventilation would have been both time-consuming and inefficient. If both doors remained shut, the room could only have been ventilated by pumping in hot air (using the fan on the stove). Thus, the cyanide gas would have become lighter than air, and could have escaped through the two openings in the ceiling, dissipating in the atmosphere. After a short time, residual concentrations of HCN would have fallen to a level at which both doors could have been opened without danger. The draught of air would then have swept away the last traces of the gas and cooled the room. Site C [= Chamber IV] was therefore used as a disrobing room.

For homicidal purposes, it could have become the ‘most productive’ gas chamber in the camp if the window had been removed. The question of whether this window existed at the time of the camp’s liberation is decisive in determining whether or not the room may have been used for homicidal gassings; since I do not know the answer, I must reserve judgment.”

As seen in the previous section, Hut 41 was built as a mere “horse-stable hut with shower bath installation,” and was still so designated on the blueprint dated July 1, 1942. If we compare a plan of its final condition with the original blueprint for Hut 42 (“Provisional Delousing Installation PoW Camp Lublin” dated March 31, 1942), we must conclude that the former was initially designed to be mirror-symmetrical to the latter, and would therefore have contained the following sectors (from north to south): vestibule/entrance – registration – hair-cutting room – undressing room – shower bath – dressing room – vestibule/exit. This is also shown by the fact that the four principal sectors of both buildings were of practically the same size: entrance/undressing room – shower bath/distribution of clothing – boiler-room – dressing room.

At the end of September or the beginning of October 1942, a cyanide gas chamber with air-heater was built in Hut 41. The air-heater was connected to the eastern wall. On October 22, the work was finished, and the area was designated “Delousing Hut with Bath.” The area previously referred to as an undressing room was used as a gas chamber without any major architectural modification, which proves that it was a make-shift solution.

As seen today, Chamber IV is very irregular in shape. It has two dead-end sections, closed on three sides, plus a separate internal room, and was therefore very difficult to ventilate. This internal room, mirror-symmetrical to the hair-cutting room in Hut 42, shows blue pigmentation on the ceiling and plaster of the northern wall. This blue pigmentation is also found on the plaster of the southern wall of Chamber IV. An even more intense bluish pigmentation finally appears in the plaster of the eastern wall, in the vestibule.

This gas chamber probably caused ventilation problems, since, as was seen in Chapter 2, the Central Construction Office decided to install a ventilation chimney on the roof, and wrote in this regard to the already-mentioned Polish firm Michael Ochnik. The relating cost estimate provides for the construction of *two* chimneys, with the piercing of a hole in the concrete ceiling. However, according to the subsequently issued invoice only one chimney was built on the roof of the gas chamber. The chimney is connected on “two sides” by “ducts” to “two openings in the concrete ceiling.” There is no doubt that these openings are

⁴⁵ J.-C. Pressac, *op. cit.* (note 30), p. ix.

ventilation intake and outlet openings. This is clearly revealed by the fact that both the openings on the roof of the gas chamber were pierced along the extended axis of the air-heater suction pipe.

The gas chamber was not designed for homicidal purposes. First, the chimney installation, as described in the above-mentioned invoice from the Michael Ochnik Corporation, could never have been used for the introduction of Zyklon B, because the HCN-saturated granules would simply have fallen onto the floor of the chimney without entering the lateral ducts leading to the holes in the concrete ceiling. Second, while the southern gas-tight door (the one leading to the shower room) was closed from the outside, the opposite, northern door closed from the inside. This means that the disinfection official responsible for pouring out the Zyklon-B granules entered the room wearing a gas mask, closed the northern door, poured out the Zyklon, left the room through the southern door, and then needed to seal the chamber from the shower room on his way out. In homicidal gassings, it would have been impossible to open the northern door because of the pile of dead bodies lying in front of it, and if only one of the two doors could be opened, this would have greatly hindered ventilation. In addition, if the northern door could be opened from the inside, the intended victims could open it as well!

The two openings visible in the ceiling of the room today measure approximately 60 cm × 60 cm (the eastern opening; see Illustration 5), and 40 cm × 40 cm (the western opening; see Illustration 6). Both led to a wooden shaft in which a small chimney made of planks had been built. This shaft was closed by means of a lid, also made of wood, on the roof of the hut. Measured from the ceiling of the room, the chimney is approximately 1.15 m in height. Its present condition (except with regard to the size and selection of raw materials), corresponds to the draft of the cost estimate dated November 18, 1942; so that the actual structure, as built, was modified later. This is shown by the fact that, inside the room, the wooden shafts around the openings interrupt the Prussian blue staining on the plaster of the ceiling. The plaster was renewed in many places around the shafts, as may be seen from the snow-white color of the plaster. Finally, the shafts themselves show not the slightest trace of blue pigmentation, quite in contrast to the window frames (see Illustration 8). Thus, it is incontrovertibly proven that the shafts were only installed at a time when Zyklon B was no longer being utilized in this room.⁴⁶ And the presence of blue stains on the window frames shows that the window existed *prior* to the liberation of the camp. Pressac's question, upon which his judgment as to the possibility of homicidal mass gassings in this room is made to depend, is thereby conclusively answered.

The above described modifications may possibly be explained on the assumption that the use of Zyklon B was abandoned, and that delousing actions in Chamber IV were conducted with hot air, using the air heater installed behind the eastern wall.

This assumption is supported by the constant shortage of Zyklon B, which was in particular short supply after the summer of 1943. At that particular time, a devastating typhus epidemic was raging in Majdanek, and huge quantities of Zyklon were needed "for camp disinfection" (see Chapter 5). The above described modifications could very well have been carried out at this time. Since the small quantities of Zyklon allocated to the camp were needed to disinfest the huts, cyanide-gas operated Chambers III and IV were converted to hot air disinfection chambers.

The hypothesis stated earlier relating to the modification of Chambers III and IIIa, also provides an explanation for the installation of Gas Chamber IV. During construction of the disinfection installation, which was really planned for the Fur and Garment Workshop, the Central Construction Office decided to use two rooms of the installation as additional morgues: one (Chamber I), was used as a permanent morgue, and the other (Chamber III), was planned as a temporary morgue. This meant that the original Chamber IIIa could no longer be used for Zyklon B disinfection. To compensate for the loss of these areas, and to provide a substitute for Chamber III, which could not be used for disinfections for the

⁴⁶ As Germar Rudolf has stressed, iron blue forms especially easily in moist walls (G. Rudolf, *The Chemistry of Auschwitz*, 4th ed., Castle Hill Publishers, Uckfield, 2020, pp. 190-192, 215-224); see his contribution on the Auschwitz gas chambers in this volume.

time being, another temporary cyanide gas chamber was installed in Hut 41, the surface area of which roughly corresponded to Chambers III and IIIa.

From an administrative point of view, these buildings were part of the Fur and Garment Workshops' construction project, even if they were located inside a building of the PoW construction project. The choice of Hut 41 for installation of the gas chamber was logical because the disinfested clothing could, by its very nature, be quite easily laid out in the "clean" sector, beneath the protective roof located over the original disinfestation installation. The disinfestation installation consisting of four gas chambers – which was already planned on October 22, 1942, and mentioned in the two cost estimates dated October 7 and 10, 1942 – was eventually allocated to the Fur and Garment Workshops' construction project as its definitive installation.

3.3. Chambers V and VI

The following fact should first be emphasized: there is no *material* proof that two Zyklon B gas chambers were ever installed in Hut 28, which are alleged to have been used for the first homicidal gassings prior to the entry into operation of Chambers I-IV.

The description of the Polish-Soviet Committee – in particular, the plan of the installation as drawn by that Committee⁴⁷ – far more resembles a drying installation for laundry than a delousing installation. In the middle of Hut 28, there were in fact two chambers, each measuring 11.75 m × 6.00 m in size. Each of these chambers had an opening in the ceiling measuring 30 cm × 30 cm. These openings could be hermetically sealed. From each of the two

⁴⁷ GARF, 7021-107-9, p. 251.

chambers, a door opposite the longitudinal wall led to a lock (*Schleuse*) measuring 2 m × 12.15 m. Each lock contained an air heater which was connected to the chamber in question. These locks possessed a door each, located opposite the door into the chamber, each leading to a room measuring 7.50 m × 12.15 m, as well as to an access door in the side wall. This structure would have made ventilation of the two chambers very difficult. The air heaters moreover were connected to the room in question by means of only a single pipe, which means that the air heaters were not used for circulation, but rather for the introduction of hot air flowing from the air-heater and exiting through the small opening in the ceiling. This opening's air-tight lid was intended to keep the hot air in the rooms for longer time periods when the air heater was out of use; for example, when drying clothing during the night.

This assumption is partly supported by the plan prepared by the Polish-Soviet Committee itself. In it, the hut where the "Gas Chambers V and VI" are supposed to have been located is referred to as a "*Sushilka*," which means drying installation.⁴⁸

Jean-Claude Pressac knows nothing of all this, believes that both chambers were delousing chambers but excludes their use for homicidal purposes. He writes:⁴⁹

"It is probable that these two improvised chambers were used for the delousing of personal belongings with Zyklon B (HCN). The proximity to the laundry is an additional argument in support of this assumption."

Homicidal gassings in these chambers are more than merely improbable. Polish historiography recently quit mentioning the alleged gas chambers in Hut 28, substituting one single gas chamber, the exact location of which cannot of course, be determined. In the – by now hopelessly outdated – official camp history, Józef Marszałek wrote in this regard:

*"The concrete gas chambers built for utilization with Zyklon B at Majdanek were put into operation in October 1942. This gas had already begun to be utilized for the killing of Soviet prisoners of war in a provisional gas chamber using the experience accumulated at Auschwitz."*⁵⁰

Czesław Rajca, who has studied the "direct extermination" of the inmates, repeats this argument in an extensive work on Majdanek:⁵¹

"While construction of the [gas] chambers consisting of concrete was awaiting completion – which was the case in October – inmates were killed in a wooden gas chamber located near the bath [correctly: the laundry] using Zyklon B, and probably in a hut installed in intermediate Area I; the location, among other things, of the so-called small crematorium,"

Since the first Zyklon delivery to Majdanek camp took place on July 30, 1942 – we will discuss the Zyklon deliveries in Chapter 5 – then the gas chamber in question must have been in operation in September and October of that year, if not as early as August.

Yet the letter from the Central Construction Office dated October 22, 1942, and mentioned in Chapter 2, contains not the slightest reference to this gas chamber, which must have been a Zyklon B disinfestation chamber. This means that it did not exist at that time.

3.4. Gas Chamber VII

Here as well, we will first quote Pressac:⁵²

"The representative Director of the [Majdanek] Museum writes that this gas chamber was used very little – very, very little; which means, speaking frankly, that it was not used at all. This fiction is maintained to avoid offending the popular superstition that every crematorium must contain a gas chamber (like the crematoria of Auschwitz-Birkenau). [...] If there had been an intention to kill people in that room with Zyklon B, its enclave-shaped location within the building, between the autopsy room, a corridor and the lying-in-state

⁴⁸ *Ibid.*, p. 115.

⁵² J.-C. Pressac, *op. cit.* (note 30), p. ix.

room, an artificial ventilation would have been absolutely mandatory, not the slightest trace of which exists, however. Natural ventilation by means of draft would have required complete evacuation of the crematorium for a period of time which is difficult to estimate."

Pressac's remarks hit the nail squarely on its head. This can be seen from the plan of the crematorium drawn by the Polish-Soviet Committee after inspecting the premises, as well as by a visual inspection of the 'crime scene.' The room once labeled the "Gas Chamber" ("*komora gazowa*") is, in reality, located between the dissection room and the morgue.

For my part, I should like to add the following considerations:

1. The walls of the room in question show not the slightest trace of blue pigmentation.
2. The opening broken through the roof (see Illustration 9) – measuring 26 cm × 26 cm – is not mentioned by the Polish-Soviet committee. In reality, the opening was crudely broken through at a later date, without even cutting the steel reinforcement rods, and without building a wooden shaft, as was the case in Chamber IV.
3. There are two peep windows in the wall adjacent to the morgue. There is no way to close them, and none is mentioned by the Polish-Soviet Committee; this means that both peep windows are in the original condition. The gas would therefore have penetrated both the morgue and the furnace room during any gassing action.

Illustration 9: Opening in the ceiling of the alleged homicidal gas chamber in the new crematorium of concentration camp Majdanek. © C. Mattogno

4. Homicidal Mass Gassings: Origins of the Accusation.

As established above, the installations in question were technically unsuited for mass homicidal exterminations and consequently, such mass exterminations did not take place. We must now examine the origins of the allegations of mass gassings in Majdanek concentration camp.

The first detailed eyewitness account appeared in 1944 without naming its author. It was published by A. Silberschein. The passages of greatest interest to the present topic are as follows:⁵³

"The furnace hut was located in the area between the first and second huts, which measured 10 m. (See plan). From the outside, these huts resembled the others, except that it had two massive chimneys, like factory chimneys. This hut was divided into three parts, each of which was almost entirely sealed off. The first part was the undressing room ('Wardrobe' on the plan), the second was hermetically sealed. This is where the gas experiments were conducted ('Gassing Room' on the plan). In the third room stood two gigantic furnaces. This hut was located between Area 1 and 2. [...]

The old and the sick were immediately ordered into the hut containing the furnaces. In the first room, they were ordered to undress. In the second, they died of suffocation within two minutes. They were then transported from the second room to the furnaces. A fire burned underground, the furnace itself did not burn. But it collected hot air at 2,000 degrees. The dead bodies were thrown into the furnace; the glowing heat sucked the fluids and moisture completely out of them. Of each of them, only a few blisters remained which were so dry that they crackled. Then special trucks carried the remains out of the city to pre-dug graves.

⁵³ A. Silberschein, *Die Judenauströpfung in Polen*, Fünfte Serie; "Das K.Z. Lager Lublin," manuscript, Geneva 1944, pp. 14-16.

Throughout 1942, thousands of Jews were killed in the gas chambers every day. New masses were transported here every week, and that is the way it has continued until this very day.” (emphasis added)

This eyewitness report is illustrated by a plan of Majdanek, which, in the light of our historical and architectural knowledge, enables us to trace the story of homicidal mass gassings at Majdanek to its roots.

The plan consists of a truly precise drawing of “Bath and Disinfestation Installation II,” Hut 42, complete with “Undressing Room,” “Clothing Deposit” (for the acceptance of clothing), “Baths” (showers), and the “Distribution Room for Inmate Clothing” (for the allocation of new clothing). But although the report dates back to 1943, it contains no mention of “Bath and Disinfestation Installation I” – Hut 41 – which, according to the Polish-Soviet description, was the center of the entire extermination program, and where exterminations had allegedly already begun in October 1942.

As far as the extermination installation itself is concerned, the witness has patched together a collage of various buildings, which certainly existed, but not in the same place, and not at the same time. The “Gassing Room” is simply Hut 28, which was some 110 m away from the furnaces, and the laundry, which was located in between the Hut 28 and the crematorium.

The erroneous description of the cremation furnaces appears full of riddles at first glance – but only at first glance. Let’s take the key sentences:

“A fire burned underground, the furnace itself did not burn. But it collected hot air at 2,000 degrees.”

This description in fact does not refer to the cremation furnaces at all, but rather to the coke-fired air heaters in Hut 28 and the delousing chambers III and IV. As shown in Chapter 2, these installations are coke furnaces whose hearths were located beneath the floor, so it was true to say “a fire burned underground.” No combustion procedure took place in the upper part of the furnace at all, so that “the furnace itself did not burn”; instead it only “collected hot air.” The temperature mentioned by the witness – 2,000 degrees Celsius – would, of course, be far too high – not only for a hot air chamber, but for a cremation furnace as well.⁵⁴ The reported number of victims – thousands per day – at another point – two million victims by the end of 1943⁵⁵ – are, of course, purely atrocity propaganda.

Constantin Simonov’s report is of particular significance because its author, who visited Majdanek right after the liberation and spent several days there, was able to speak with former inmates who told him the story of the camp and explained the function of its installations to him. The Simonov report is therefore based on eyewitness accounts and corresponds to the ‘official’ version of the camp history which was being bandied about among the inmates during July and August of 1944. It therefore pre-dates the version of the Polish-Soviet Committee. At several points, it deviates from the orthodox version of history as established shortly afterwards. It refers to an extermination installation which was then immediately forgotten, and it makes no mention of a “Gassing Room” in the old crematorium and locates the alleged homicidal gassings in the disinfestation installation adjacent to Hut 41. The killing technique described is rather peculiar:⁵⁶

“Where does the little window lead? To find the answer to this question, we open the door and leave the chamber. Next to the chamber there is another small concrete chamber. This is where the little window leads. Here, there is an electrical light and a switch. From here, looking outward from the little window, you can see everything in the first chamber. On the floor are a few round, hermetically sealed cans labelled Zyklon B, and, in small letters: ‘For special use in the eastern territories.’^[57] The content of the cans was introduced into the adjacent chamber through pipes when the chamber was packed full of people.

⁵⁴ In this regard, see the study by Franco Deana and me on the “The Cremation Furnaces of Auschwitz nad Birkenau,” in this volume.

⁵⁵ Silberschein, *op. cit.* (note 53), p. 16.

⁵⁶ Simonov, *op. cit.* (note 33), pp. 8f.

⁵⁷ In fact, such a specially labeled Zyklon B never existed.

The naked people stood closely next to each other; they didn't take up much room. 250 people were packed together into 40 square meters of surface area. They were driven inside. The steel door was shut, and the cracks stuffed with clay to provide a hermetic seal. A special team wearing gas masks introduced the Zyklon contents of the round cans into the adjacent chamber through the pipes. 'Zyklon' consists of small blue crystals, harmless in appearance. Upon contact with oxygen, however, it immediately begins to release poisonous gas, simultaneously affecting all the vital centers of the human body. Zyklon was introduced through the pipes.^[58] The SS man directing the operation turned on the light switch; looking through the little window, the SS man watched the entire suffocation procedure, which, as gathered from various eyewitness reports, lasted between 2 and 10 minutes. Looking through the window, he could see everything without danger: the cruelly distorted faces of the dying, the gradual effect of the gas. The peephole for the executioners is located in just the right spot, at eye level. When the victims died, the observer didn't need to look down, since the victims didn't fall down after their death. The gas chamber was in fact, full to the brim, so that the dead stood standing motionless." [All emphasis added]

This description of the killing method, which is completely hare-brained from a technical point of view, proves that the former Majdanek inmates never saw a homicidal gassing. No witness told Simonov of having seen SS men on the roof of a gas chamber wearing gas masks and carrying Zyklon B cans in their hands; no one told him that the victims were killed with carbon monoxide in two rooms containing gas-pipe installations. As J.-C. Pressac correctly says, the Zyklon B cans found by Simonov were placed in the small cell in front of Chambers I and III to give the impression that the content of the cans was introduced into the chamber through pipes. This setting up of a fictitious scene, most certainly done by former inmates, proves *a fortiori* that the witnesses were never present during any mass homicidal gassing. There is no doubt that *rumors* of mass homicidal gasings were circulating in the camp, and that former inmates crudely sought to provide these rumors with an aura of authenticity with their staging in order to take vengeance on their oppressors, but in reality, their statements show that no homicidal gasings took place.

It is also remarkable that Simonov had nothing to say regarding Chamber IV. It is quite obvious that the former inmates did not consider it to be a homicidal gas chamber.

Later eyewitnesses are so vague and contradictory that we can skip them for the present. It is highly revealing that Józef Marszałek, the long-time director of the Majdanek Memorial, only mentions gasings in *two* pages in his official history of the camp. In fact, he could think of nothing better to say about the gassing procedures at Majdanek than to quote the eyewitness account of SS man Pery Broad at *Auschwitz*:⁵⁹

"The technique of killing with gas was described as follows by Perry [sic] Broad, an employee of the Political Division of Auschwitz Camp. A similar technique was utilized at Majdanek."

And that's it from the Memorial Director himself!

5. Zyklon-B Deliveries to Majdanek

In Germany, Zyklon B was manufactured by two industrial factories, the Dessauer Werke für Zucker und Chemische Industrie A.G. in Dessau, and Kaliwerke A.G. in Kolin.⁶⁰ Distribution was controlled by the *DEGESCH* company (Deutsche Gesellschaft für Schädlingsbekämpfung GmbH) which was the legal manufacturer as holder of the patent and manufacturing license. DEGESCH did not market the product directly, but rather through two main representative companies, Heerdt und Linger GmbH (*Heli*), a Frankfurt corporation, and *Tesch & Stabenow*, Internationale Gesellschaft für Schädlingsbekämpfung (*Testa*), a Hamburg corporation. These two firms divided the market between them, *Heli* being active west of the River Elbe, and *Testa* east of the River Elbe, exclusively in the Sudeten District, the

⁵⁸ Since Zyklon B is liquid HCN adsorbed on gypsum rather than a pressurized gas, it cannot be piped.

⁵⁹ J. Marszałek, *Majdanek*, op. cit. (note 50), p. 141.

⁶⁰ I.G. Farben produced only the warning substance, bromacetic acid methyl ester, as well as the stabilizer, chlor carbonic acid methyl ether.

General Government, the Reichskommissariat Ostland, and the Scandinavian states of Denmark, Norway, and Finland. Since Majdanek was located in the territory of the General Government, it received its Zyklon from Testa.

Extremely detailed correspondence has been found relating to the Zyklon deliveries between the camp administration on the one hand, and Testa and the SS institutions involved in Zyklon distribution for bureaucratic grounds, on the other hand. This correspondence⁶¹ has been studied by Adela Toniak, who reproduced 37 of the 60 documents making up the exchange of correspondence, in a study.⁶² The Polish author calculated that a total of 7,711 kg of Zyklon were delivered to the Lublin camp,⁶³ but her calculations contain two errors. Table I summarizes the Zyklon B orders, as well as actual deliveries.

Although the documents do not permit the slightest doubt that the administration of Lublin camp ordered Zyklon for disinfestation purposes to the exclusion of any other purpose, Adela Toniak prefers to stick to her homicidal theories, adducing historically groundless arguments.⁶³ Without entering into further detail, it should be noted that the correspondence between the camp administration and the Tesch & Stabenow firm repeatedly refers to the “danger of epidemics,” “disinfestation of inmate housing and clothing,” “thorough disinfection,” “disinfection work,” “camp disinfection,” and “disinfection gas” (*i.e.*, Zyklon B).⁶⁴ Since even Adela Toniak cannot conceal the fact that devastating typhus epidemics repeatedly ravaged Majdanek, and since Zyklon B was the most effective means of combating typhus as she also admits, there is no justification for the assumption that the Zyklon deliveries served any purpose other than the extermination of lice. The only “criminal traces” are the alleged ‘camouflage expressions.’

The attempt to attribute a criminal purpose to the Zyklon deliveries forms part of an outdated system of interpretation which dominated earlier decades, but which has been definitively destroyed by Jean-Claude Pressac. Writing in 1989, Pressac stated that 97 to 98 percent of all Zyklon B delivered to Auschwitz, was used for disinfestation purposes and that only 2 to 3 percent was used for alleged homicidal gassing of inmates.⁶⁵

In fact, these 2 to 3 percent of all Zyklon delivered to Auschwitz would have sufficed for the claimed gassing of the reported number of victims, so that Pressac’s calculation is theoretically correct. But since 2 to 3 percent of all Zyklon deliveries is an amount too small to

⁶¹ APMM, sygn. I, d. 2, Vol. I.

⁶² Adela Toniak, “Korespondencja w sprawie dostawy cyklonu B do obozu na Majdanku” in *ZM*, II, 1967, pp. 129-170.

⁶³ *Ibid.*, p. 137.

⁶⁴ The documents involved are discussed in detail in the book by Jürgen Graf and me cited in the first footnote.

⁶⁵ J.-C. Pressac, *Technique and Operation of the Gas Chambers*, The Beate Klarsfeld Foundation, New York 1989, p. 188; also in his second book: J.-C. Pressac, *Die Krematorien von Auschwitz*, Piper, Munich 1994, p. 58.

be statistically significant, the total amount of Zyklon B delivered does not prove any homicidal gassing claims. The same applies to Majdanek.⁶⁶

6. Revisions by Orthodox Historians

Shortly after the capture of the camp, the Soviets claimed a death toll of some two million for that camp during a press conference in Lublin on August 25th, 1944.⁶⁷ During the Polish trial in late 1944 against six former camp guards, the Majdanek death toll was set to 1.7 million.⁶⁸ Roughly a year later, during the Nuremberg International Military Tribunal, the Soviets introduced an investigation report claiming that up to 1.5 million inmates had been killed in that camp using seven different gas chambers, among other methods.⁶⁹

This figure, however, was significantly reduced three years after the war, when Polish judge Zdzisław Łukaszkiewicz, a member of the Polish “Commission to Investigate German Crimes in Poland,” published the commission’s findings about Majdanek, which set that camp’s death toll at 360,000.⁷⁰

The next downgrading came after the collapse of the communist Eastern Bloc, when Polish historian Czesław Rajca reduced the death toll down to 235,000 in a 1992 paper.⁷¹

Up to that point, all orthodox historians maintain the claim that there were seven homicidal gas chambers at Majdanek: three in the disinfestation building just outside of Hut 41 (Chambers I-III), one inside Hut 41 (Chamber IV), two in Hut 28, and one in the new crematorium.

In 1998, a game-changing book appeared that, for the first time in Majdanek research history, based its conclusion on the full amount of wartime documents available, on expert literature about the problems involved, such as the use of Zyklon B and cremation technology, and on strictly rational and common-sense considerations about the material remains of the claimed crimes scenes: The first, German edition of Mattogno’s and Graf’s monograph *Concentration Camp Majdanek*.⁷² It concluded that there weren’t any homicidal gas chambers at Majdanek at all, and that the death toll of this camp amounted to approximately 42,200 according to the extant documentation.⁷³

There were two noteworthy reactions to this book by orthodox scholars, which both appeared in 2005:

1. German scholar Barbara Schwindt pillaged Mattogno’s and Graf’s work by using the documentation contained in it – without ever acknowledging her source – in a vain attempt to rescue as much as possible of the exterminationist case.⁷⁴ In the process, she jettisoned all homicidal gas chambers except for Chambers I through III. Her argu-

⁶⁶ Assuming a concentration of HCN 10 times higher than that which expert literature claims is immediately lethal – 0.3 g/m³ – (but compare Germar Rudolf’s arguments as to the flawed nature of this value in his contribution on the gas chambers of Auschwitz in the present volume), one 1,500-gram can of Zyklon B in Chamber III would have been enough to kill 3,000 people. This figure is calculated as follows: Chamber III is approximately 35 m² in surface area, with a volume of approximately 70 m³. Assuming, with Pressac, a maximum number of 350 victims per gassing action, and hypothetically assuming a HCN concentration of 3 g/m³, the quantity of HCN required for one gassing procedure would be as follows:

– effective volume: approximately 50 m³ (the bodies of the victims would occupy approximately 20 m³).
– required quantity: HCN: 3 g/m³ × 50 m³ = 150 g.

⁶⁷ See excerpts of that press conference with an English narrator: “Majdanek concentration camp - part 3 of 5,” 5:56 to 6:01; <http://youtu.be/lqFFYagEwYg>.

⁷² *Konzentrationslager Majdanek: Eine historische und technische Studie*, Castle Hill Publishers, Hastings 1998.

⁷³ *Ibid.*, p. 79. In the current English edition (note 1), this figure happens to be mentioned on the same page.

⁷⁴ Barbara Schwindt, *Das Konzentrations- und Vernichtungslager Majdanek: Funktionswandel im Kontext der “Endlösung,”* Königshausen & Neumann, Würzburg 2005.

ments, however, are based on flawed thinking and on the misrepresentation of the actual contents of the documents she adduced.⁷⁵

2. In a detailed research paper of 2005, Tomasz Kranz, then head of the Majdanek Museum's research department, decided to streamline the official narrative by reducing the death toll down to 78,000,⁷⁶ and to ditch five of the seven initially claimed gas chambers. For him, only Chambers I and III were used for gassings,⁷⁷ albeit only very little – very, very little, as Pressac would put it... In contrast to Schwindt, Kranz, who had direct access to most of the pertinent documents in his employer's archives, did not resort to plundering our work – he even mentions it in passing, although derogatively.⁷⁸ But he applied basically the same flawed, if not mendacious methods⁷⁹ as Schwindt did in order to support a narrative that is ultimately destined to end in the “dustbins of history,” to quote Pressac one last time.⁸⁰

⁷⁵ See my rebuttal “Barbara Schwindt’s ‘Research’ on Majdanek,” in: J. Graf, C. Mattogno, *op. cit.* (note 1), Appendix 1, pp. 247-259.

⁷⁶ Tomasz Kranz, “Ewidencja zgonów i śmiertelność więźniów KL Lublin” (“Records on deaths and mortality of prisoners of the Lublin Concentration Camp”) *ZM*, 23 (2005), pp. 7-53; a German translation appeared as a booklet two years later: T. Kranz, *Zur Erfassung der Häftlingssterblichkeit im Konzentrationslager Lublin*, Państwowe Muzeum na Majdanku, Lublin, 2007.

⁷⁷ That claim is spelled out in a contribution to a 2011 German anthology: T. Kranz, “Massentötungen durch Giftgas im Konzentrationslager Majdanek” in: Günter Morsch, Bertrand Perz (eds.), *Neue Studien zu Nationalsozialistischen Massentötungen durch Giftgas: Historische Bedeutung, technische Entwicklung, revisionistische Leugnung*, Metropol Verlag, Berlin 2011, pp. 219-227, here pp. 221f.

⁷⁸ T. Kranz, *Zur Erfassung...* *op. cit.* (note 76), p. 54. In his contribution to the anthology by Morsch and Perz, however (note 77), any reference to our work was excised, probably because the German editors refuse to draw attention to the works which this anthology claims but miserably fails to refute – a classic anti-scholarly attitude.

⁷⁹ See my rebuttal “The Gas Chambers of the Majdanek Camp,” in: C. Mattogno, *Inside the Gas Chambers: The Extermination of Mainstream Holocaust Historiography*, 2nd ed., Castle Hill Publishers, Uckfield 2016, pp. 114-131; see also Jürgen Graf’s analysis “The Keepers of the Holy Grail and Their Lies,” in: J. Graf, C. Mattogno, *op. cit.* (note 1), Appendix 3, pp. 275-281.

Diesel Gas Chambers: Ideal for Torture – Absurd for Murder

FRIEDRICH PAUL BERG AND GERMAR RUDOLF

1. Causes for a Public Debate

Most National-Socialist homicidal gassings were supposedly committed with Diesel-exhaust gases rather than cyanide or Zyklon B. Although this is contrary to popular perceptions about the Holocaust story, Diesel exhaust has been dominant, at least in terms of numbers of victims, in the claims of orthodox Holocaust scholars since the 1960s. The Diesel allegations did, however, gain some public notoriety in the late 1980s and early 1990s with the prosecution of American citizen John Demjanjuk. Demjanjuk was wrongly accused of having aided in the murder of at least 875,000 Jews with Diesel exhaust in the alleged Treblinka Extermination Camp in 1942/43.¹ A nationally syndicated essay from one of America's best-known newspaper columnists of that time, Patrick Buchanan, raised the subject of Diesel gassing to a fever pitch in the American press in early 1990. Buchanan, a former assistant to President Ronald Reagan, claimed that Diesel engines could not kill at all.² His sweeping statement, which was far too broad, brought him massive criticism but not for any valid technical reasons.³

A stir was caused in Europe in 1992 by a working draft paper authored by Walter Lüftl, then President of the Austrian Federal Chamber of Engineers, in which he described mass murder with Diesel exhaust as a "sheer impossibility", among other things.⁴ Shortly thereafter, he substantiated his view as to the relative harmlessness of Diesel exhaust in an essay,⁵ which was attacked as well, although rather amateurishly.⁶

For readers familiar with auto-emission issues, much of what follows represents a kind of 'overkill' and rightly so. But in order to put the Holocaust monster to its final, well-deserved rest – at least its Diesel portion – one must be rigorous and even exhaustive. Since Diesel gassings are not technically impossible, we must actually show how it could have been done hypothetically, and then, just how thoroughly unreasonable it is to believe the National Socialists would have ever used the necessary technology.

This chapter is an expanded and revised edition of F. P. Berg's article "The Diesel Gas Chambers – Myth Within a Myth," *JHR*, 5(1) (1984), pp. 15-46. Although this author gladly takes credit for this work, the editor Germar Rudolf deserves credit also for having made many substantive additions to the arguments and for many important reference citations.

- ¹ The history of, and public reactions to, this travesty of justice are described in the following chapter by A. Neumaier.

Rudolf, "Lüge und Auschwitz-Wahrheit," in: G. Rudolf, *Auschwitz-Lügen. Legenden, Lügen, Vorurteile von Medien, Politikern und Wissenschaftlern über den Holocaust*, Castle Hill Publishers, Uckfield, 2016, pp. 187-227, here pp. 205-213.

In any event, according to my conviction, National-Socialist homicidal gassings never happened!

2. Introduction

In any trial of even the most ordinary murder, one can expect an abundance of information about the murder weapon. One would expect the Allied and German post-war trials about murder as novel and as bestially spectacular as the mass murder of millions of Jews in gas chambers to provide the most extensive and precise documentation possible. Although there is a vast literature based primarily on those trials which include many “eyewitness testimonies” and “documents,” as far as the actual mechanics of the extermination process are concerned, all one really finds is an occasional short and vague description.

75 years have elapsed since the end of World War Two. The Holocaust specialists have had more than enough time to examine documents and alleged mass murder sites as well as testimony from the most extensive trials in the entire history of the world. Throughout this period, they have been extremely active – but aside from a few bits and pieces of so-called ‘confessions’ and ‘eyewitness testimony,’ they have found next to nothing. The vast information gaps about the actual mechanics of the alleged extermination process should arouse the gravest suspicion.

Although the information gaps are bad for the exterminationist position; what is even worse is that the few bits and pieces of information resemble an absurd, incredible jumble. To characterize the alleged mass murder method as ‘hare-brained,’ ‘crackpot,’ or ‘weird’ is to understate the situation. If one looks at the claims critically, sooner or later it becomes obvious that the people who repeat the Holocaust story in one form or another simply have no idea as to what they are talking about. The testimony of so-called ‘eyewitnesses’ is especially weird. The statement by Kurt Gerstein, which for a long time was the evidence most often used by orthodox Holocaust specialists, is the best example for the quality of such testimony. The other ‘statements’ or ‘confessions’ are just as bad or even worse.

The absurdities of the various alleged extermination methods do not in and of themselves prove that the Holocaust did not happen, but they should at least persuade reasonable people to ask for some strong corroborating evidence before giving credence to such horrible stories. The fact that other evidence is missing as well, such as documents ordering the killing of Jews with gas, or forensic evidence such as autopsy reports of gassing victims, or physical evidence such as functioning gas chambers, should make it obvious to everyone that something isn’t right. The ‘gas chambers’ of Treblinka, Belzec and Sobibor were all allegedly destroyed before the war ended. Those still existing in Auschwitz, Stutthof and Majdanek as well as those in the camps in the Reich proper were ordinary rooms (mortuaries, shower rooms, delousing chambers) that have been mislabeled ‘gas chambers’ in spite of their obvious design and function – often meant to keep people alive.⁷

To concoct horrible but conveniently vague ‘eyewitness’ accounts of mass murder is easy. To have such tales accepted about a defeated enemy nation after a brutal war, during which the vast media resources of the victors had already succeeded in portraying the enemy as thoroughly depraved and wicked, is also easy. On the other hand, it is not at all easy to explain how one could possibly commit mass murder with Diesel exhaust. The exterminationists have never provided the necessary explanation, not even in the great Israeli show trial of John Demjanjuk, where precisely such an explanation of the Diesel-murder-method should have been demanded – at least by the defense.

3. The Exterminationist Position

Table 1 lists data taken from the latest orthodox anthology dealing with all the camps in Europe where gas-chamber executions are said to have taken place during the Second World War.⁸ The table summarizes some main characteristics of those camps where mass gassings

⁷ Cf. the contributions by W. Wallwey, G. Rudolf on the Auschwitz gas chambers, Carlo Mattogno on the Majdanek gas chambers, and by Jürgen Graf in this volume.

⁸ Günter Morsch, Bertrand Perz, (eds.), *Neue Studien zu nationalsozialistischen Massentötungen durch Giftgas: Historische Bedeutung, technische Entwicklung, revisionistische Leugnung*, Metropol, Berlin,

Table 1: Characteristics of Claimed Death Camps According to Morsch/Perz				
CAMP	LOCATION	JURISDICTION	CHAMBER TYPE (POISON TYPE)	GASSING VICTIMS
Kulmhof (Chelmno)	Wartheland	Higher SS and Police Leader (Koppe)	2 or 3 “gas vans” (engine exhaust)	152,477 (p. 183)
Belzec	Lublin Area	SS and Police Leader (Odilo Globocnik)	3, later 6 gas chambers (engine exhaust)	435,000 (p. 24)
Sobibor	Lublin Area	SS and Police Leader (Odilo Globocnik)	gas chambers (engine exhaust)	150,000-250,000 (p. 24)
Lublin (Majdanek)	Lublin Area	WVHA*	2 gas chambers, 1 “gas van” (CO & HCN, engine exhaust)	12,200 (p. 227)
Treblinka	Warsaw Area	SS and Police Leader	3, later 6 or 10 gas chambers (engine exhaust)	800,000-1,100,000 (p. 24)
Auschwitz	Upper Silesia	WVHA	9 gas chambers, 1 “gas van” (HCN, engine exhaust)	500,000+ (p. 216)

*SS-Wirtschafts- und Verwaltungs-Hauptamt = Economic-Administrative Main Office

are said to have occurred, including their alleged execution methods. Note that the last column does *not* list the total death toll of the camps listed, but merely the death toll due to gas executions. In addition, the currently circulated orthodox narrative also claims that gasings on a minor scale occurred in other camps,⁹ which are not included here due to the relatively small number of victims claimed, because these gassing claims are not accepted in unison by the orthodoxy, and frankly because the evidence adduced by Morsch, Perz and colleagues to prove their reality is ludicrously unreliable and untrustworthy.¹⁰

The fourth column from the left shows that in almost all of the camps, the killing operation supposedly used engine exhaust gasses, the lethal component of which is carbon monoxide (CO). In Auschwitz, the killing operation supposedly used almost exclusively hydrogen cyanide (HCN). The few existing witness claims about the use of a gas van at Auschwitz are otherwise unsubstantiated and are said to have been limited to only a very few victims. The same is true for gas-van claims regarding the Lublin Camp (Majdanek), where the total death toll has been reduced since the war from initially two million to currently only 78,000,¹¹ with only 12,200 of them supposedly having been murdered in stationary gas chambers either by Zyklon B or bottled carbon monoxide.

Among the five camps where carbon monoxide was supposedly used in one form or another, the vast majority of victims are said to have been killed in just three camps using engine exhaust gases in stationary chambers: Treblinka, Belzec, and Sobibor. In Belzec and Treblinka, the carbon monoxide was supposedly generated by Diesel engines. The situation is less clear about Sobibor; I will return to that later. The number of Jews supposedly killed in Kulmhof (Chelmno) is small compared to the numbers for Treblinka, Belzec and Sobibor. Some of the gas vans supposedly employed in Russia are also said to have used Diesels.¹²

On the basis of generally accepted numbers of victims, *nearly two-thirds of all the alleged Jewish victims of German gas chambers were supposedly gassed with engine exhaust gases, most of them using Diesel engines.*

The orthodox background narrative of the usage of engine exhaust for mass murder is quite perplexing, to say the least. When Hitler signed his infamous euthanasia order at the beginning of the war, an expert from Germany’s official Institute for Forensic Technology (*Kriminal-*

2011.

⁹ This concerns the following camps: Mauthausen (Zyklon B, gas van; 3,500 victims; Morsch/Perz, p. 25); Sachsenhausen (Zyklon B, gas van; thousands of victims; *ibid.*, pp. 271f.); Ravensbrück (Zyklon B, gas van; 5,000-6,000 victims; *ibid.*, p. 25); Neuengamme (Zyklon B; 448 victims; *ibid.*, pp. 289, 292); Stutthof (Zyklon B; 1,150 victims; *ibid.*, p. 25); Natzweiler (“cyanide salt”; 86 victims); Dachau (Zyklon B; maybe no victims).

¹⁰ For details see C. Mattogno’s critical analysis: *Inside the Gas Chambers: The Extermination of Mainstream Holocaust Historiography*, 2nd ed., Castle Hill Publishers, Uckfield 2016.

¹¹ See the last chapter of C. Mattogno’s contribution about Majdanek in the present volume.

¹² Morsch/Perz claim some 250,000 victims of these vans, some 30 of which are said to have existed (p. 24).

technisches Institut) within the German Imperial Police Office for Crime Investigation (*Reichskriminalpolizei*) is said to have come up with the method of painlessly putting to sleep severely mentally handicapped people using bottled carbon monoxide. Instead of sticking to this purportedly proven and successful method, the same expert from this institute, Albert Widmann, when asked to help out an insane asylum near Minsk (Belorussia) to euthanize some of their patients, allegedly travelled there in late 1941, but rather than taking along a couple of CO steel bottles, he hauled 400 kg (882 lbs.!) of explosive to Minsk in his vehicle, and once there, tried blowing up those mental patients with it. When that failed – or rather ended in a bloody mess – he tried killing them with vehicle-exhaust gases, but that was rather cumbersome, too. A few months later, he was allegedly charged with testing the functionality of a Saurer-type “gas van” – which had a diesel engine – but he came up empty-handed, claiming that the tests he had performed did not yield any useful results.¹³ (After reading the present paper, the reader will understand why.) Yet still, an entire series of these Saurer trucks with diesel engines yielding “no useful results” are said to have been deployed as “gas vans” in subsequent months.¹⁴ Then, when a large portion of the staff involved in the then-discontinued euthanasia operation were transferred to some of the camps of the “Operation Reinhardt” in early 1942 – meaning Belzec and Treblinka (plus some to Majdanek) – these camps were allegedly equipped with homicidal gas chambers using – no, not CO steel bottles, which the staff running these camps were familiar with and knew they could rely on; rather, they allegedly chose engine exhaust as their murder weapon. First, the Belzec Camp supposedly started its diesel-operated mass murder in March 1942; next, the Sobibor Camp followed in April 1942, this time either with an unknown engine type, a diesel engine or a gasoline engine, depending on which witness you believe – maybe someone had figured out in Belzec in the meantime that diesel yielded “no useful results” and switched to a better solution? But no, because the last camp, Treblinka, presumably started its mass-murder activities in July 1942 using also a diesel engine.¹⁵

4. Which Engine Type Was Used?

4.1. Belzec

Our story begins in 1953 in Germany. In that year, a German historian reproduced in Germany’s leading journal for contemporary history one of the 1945 “confessions” by Kurt Gerstein, which he had made while in French custody.¹⁶ To this day, Gerstein’s “confessions” are a major cornerstone of the Holocaust legend. Gerstein was an *Obersturmführer* (First Lieutenant) in the SS and a mine surveyor by profession with a graduate degree in engineering. When he surrendered to the French, he supposedly gave them a prepared statement dated April 26, 1945. He had been elevated to the status of “righteous gentile” by the Israelis and various Jewish writers for having at least tried to alert the world to the National-Socialist extermination program. As Henri Roques pointed out,¹⁷ six different versions of the Gerstein Statement have been found to date and published by various researchers often in grossly distorted and mutilated form.¹⁸ Since many parts of Gerstein’s statements range

¹³ For details see the chapter on Albert Widmann in: S. Alvarez, *The Gas Vans: A Critical Investigation*, 2nd ed., Castle Hill Publishers, Uckfield 2023, pp. 219-225.

¹⁴ The number of trucks results from a RSHA file memo of June 23, 1942; see S. Alvarez, *ibid.*, pp. 329-333.

¹⁵ On the puzzling question why a proven method was replaced by something that couldn’t work as well, if at all, see C. Mattogno, *op. cit.* (note 10), pp. 62-72.

Raul Hilberg, “Expert’s admission: Some gas death ‘facts’ nonsense,” *Toronto Sun*, Jan. 17, 1985.

¹⁸ An example of gross distortions is Léon Poliakov, who changed the gas chamber’s surface area given by Gerstein to make his insane packing density of people look more credible: *Harvest of Hate*, Schocken

from the fantastically incredible to the downright impossible, and because he allegedly committed suicide in a French prison after having offered himself in vain as an informer to the French, more and more orthodox scholars refrain from using him as a key witness. Raul Hilberg, for example, referred to Gerstein's 'statement' six times in his *opus magnum* without actually quoting from it,¹⁹ but in his later work on the *Sources of Holocaust Research*, he didn't even mention Gerstein anymore.²⁰ Yet still, Gerstein's 'confessions' are the only ones which give at least a few technical details about the alleged gassings at Belzec.

The following text is an excerpt from the Gerstein Statement as given in *Harvest of Hate* by Léon Poliakov. Aside from a rather brazen 'error' on the part of Poliakov – namely the claim that 700 to 800 bodies were crowded into 93 square meters (1,000 sq.ft.), instead of only 25 square meters (269 sq.ft.), which is the way the original document actually reads – it is probably no worse than any of the other translations which can be found:¹⁸

“SS men pushed the men into the chambers. ‘Fill it up,’ Wirth ordered; 700-800 people in 93 [sic; original claims 25] square meters. The doors closed. [...]

Then I understood the reason for the ‘Heckenholt’ sign. Heckenholt was the driver of the Diesel, whose exhaust was to kill these poor unfortunates.^[21] SS Unterscharführer Heckenholt tried to start the motor. It wouldn't start! Captain Wirth came up. You could see he was afraid because I was there to see the disaster. Yes, I saw everything and waited. My stopwatch clocked it all: 50 minutes, 70 minutes, and the Diesel still would not start! The men were waiting in the gas chambers. You could hear them weeping ‘as though in a synagogue,’ said Professor Pfannenstiel, his eyes glued to the window in the wooden door.^[22] Captain Wirth, furious, struck with his whip the Ukrainian who helped Heckenholt. The Diesel started up after 2 hours and 49 minutes, by my stopwatch. Twenty-five minutes passed. You could see through the window that many were already dead, for an electric light illuminated the interior of the room. All were dead after thirty-two minutes!

Jewish workers on the other side opened the wooden doors. They had been promised their lives in return for doing this horrible work, plus a small percentage of the money and valuables collected. The men were still standing, like columns of stone, with no room to fall or lean. Even in death you could tell the families, all holding hands. It was difficult to separate them while emptying the room for the next batch. The bodies were tossed out, blue,^[23] wet with sweat and urine, the legs smeared with excrement and menstrual blood.”

It is physically impossible to crowd 700 to 800 people into a space of only 25 square meters, i.e., 28 to 32 people per square meter.²⁴ According to Gerstein, it was not a peephole through which Professor Pfannenstiel supposedly looked into the gas chamber – it was a window in a wooden door, and not a gas-tight, panic-proof steel door as one might expect. Supposedly, there were wooden doors on two sides of at least one of the gas chambers. We are told that the intended victims were still alive after almost three hours in the gas chambers before the

Books (Holocaust Library), New York 1979, p. 195 (French ed.: *Bréviaire de la haine*, Calman-Lévy, Paris 1951, p. 223.).

²⁰ R. Hilberg, *Sources of Holocaust Research: An Analysis*, Ivan R. Dee, Chicago 2002.

²¹ According to Y. Arad, *Belzec, Sobibor, Treblinka: The Operation Reinhard Death Camps*, University Press, Bloomington 1987, p. 123, the real name of this Heckenholt was Lorenz Hackenholt. Besides Hackenholt, Arad claims that Ivan Demjanjuk was responsible for operating the Diesel gas chambers in Treblinka, *ibid.*, p. 86. In light of the disastrous outcome of the Demjanjuk affair for the Israelis, it should now be obvious that most of the eyewitness accounts used by Arad are worthless. It appears that Arad's book, published when the Demjanjuk case was not yet settled, is nothing more than propaganda for influencing the trial's outcome.

²² This sentence is missing from the version given by H. Rothfels, op. cit (note 16). Instead, Rothfels remarked: “A strictly personal observation then follows.”

²³ Version T2, H. Roques, op. cit. (note 17), German ed., p. 57.

²⁴ Even closely crowded, 10 people per square meter are the maximum; cf. E. Neufert, *Bauentwurfslehre*, Vieweg, Wiesbaden 1992, p. 27; cf. U. Walendy, *Historische Tatsachen* No. 29, Verlag für Volkstum und Zeitgeschichtsforschung, Vlotho 1985, p. 12: 46 persons will fit onto the 4.44 m² load area of a heavy-goods vehicle, according to the German magazine *Quick*, April 25, 1985.

Diesel even started, so there must have been many air leaks into the chambers or else the Jews would have been asphyxiated without the aid of any Diesel.

There is no mention anywhere of the intended victims trying to break out. Wooden doors with glass windows would hardly have withstood a determined group effort to break through. Surely, Prof. Pfannenstiel, with “his eyes glued to the window,” would have noticed if some people had been trying to smash the glass. But no, we are told instead that the victims were calm enough and reflective enough to form groups of family members, and hold hands, and even weep.

Evidently, Dr. W. Pfannenstiel, Professor of Hygiene at Marburg, had been sent to Belzec and other camps as medical adviser to improve hygiene and health care in the camps. That was probably also Gerstein’s mission, as he was the head of technical disinfection services at the Hygiene Institute of the Waffen SS. After the war, Pfannenstiel was repeatedly interrogated regarding his visit to Belzec with Gerstein. He was charged in two cases but never convicted. In the court-room statements available to us, he never directly disputed Gerstein’s account. In fact, Dr. Pfannenstiel confirmed in one of his post-war statements that the engine used in Belzec “was run with Diesel fuel.”²⁵ Since only Diesel engines run with Diesel fuel, we have here a confirmation of Gerstein’s claim about the engine type. However, in a private letter, Dr. Pfannenstiel described the Gerstein Statement as “highly dubious rumor-mongering in which ‘fantasy’ far outweighs fact.”²⁶ He also wrote that, due to the persecution and slander to which he was exposed, he did not wish to comment further on the matter publicly. In other words, if he validated the Gerstein Report during his interrogations, he did so not because he agreed with it,²⁷ but because he tried to avoid further trouble for himself.

According to the last sentence of the Gerstein text quoted above, the bodies of the victims were “blue.” Other so-called eyewitnesses also repeated the claim that the corpses were “blue.”²⁸ Here we have a major flaw as far as the death-from-carbon-monoxide theory is concerned because victims of carbon monoxide poisoning are not blue at all. On the contrary, victims of carbon monoxide poisoning are a distinctive ‘cherry red’ or ‘pink.’²⁹ This is clearly spelled out in most toxicology handbooks and is probably well known to every doctor and to most, if not all, emergency medical personnel.³⁰ Carbon monoxide poisoning is actually very common because of the automobile, and accounts for more poison gas injuries than all other gases combined.

Although it is remotely possible that an engineer mistakes a gasoline engine for a Diesel engine, how could anyone mistake red for blue? Perhaps they were all color-blind?

²⁵ Testimony by Prof. W. Pfannenstiel, around 1960, quoted from: E. Kogon, H. Langbein, A. Rückerl *et al.* (eds.), *Nationalsozialistische Massentötungen durch Giftgas*, S. Fischer, Frankfurt/Main 1983, p. 173; the English edition actually translates that as “It was a diesel engine”: *Nazi Mass Murder*, Yale University Press, New Haven 1993, p. 130; I subsequently quote pages first from the German and then from the English edition.

²⁶ Letter from Pfannenstiel to P. Rassinier, dated Aug. 3, 1963, published in W. Stäglich, U. Walendy, “NS-Bewältigung,” *Historische Tatsachen* No. 5, Historical Review Press, Southam (GB) 1979, p. 20.

²⁷ A thesis posited by E. Nolte in: *Streitpunkte*, Propyläen, Berlin 1993, pp. 309f.

²⁸ E.g., Pfannenstiel’s testimony on June 6, 1950, before a Darmstadt court, quoted from Saul Friedländer, *Counterfeit Nazi: The Ambiguity of Good*, Weidenfeld and Nicolson, London 1967, p. 118; cf. also, e.g., K. A. Schluch, around 1960, quoted from: E. Kogon *et al.* (eds.), *op. cit.* (note 25), p. 168/119; cf. A. Rückerl (ed.), *NS-Vernichtungslager im Spiegel deutscher Strafprozesse*, Deutscher Taschenbuch-Verlag, Munich 1977, p. 142; for a more in-depth analysis of the dilemma faced to this day by every German who ever had anything even remotely to do with one of the camps – Treblinka, Belzec and Sobibor were in fact more transit camps than concentration camps – see W. Lindsey, “Zyklon B, Auschwitz, and the Trial of Dr. Bruno Tesch,” *JHR* 4(3) (1983), pp. 261-303, as well as the contribution by G. Rudolf on witness testimony, this volume.

²⁹ Regarding the toxicology of carbon monoxide, cf. e.g.: W. Forth, D. Henschler, W. Rummel, K. Starke, *Allgemeine und spezielle Pharmakologie und Toxikologie*, 6th ed., Wissenschaftsverlag, Mannheim 1992, pp. 756ff.; S. Kaye, *Handbook of Emergency Toxicology*, 4th ed., C. C. Thomas, Springfield 1980, pp. 187f.; C. J. Polson, R. N. Tattersall, *Clinical Toxicology*, Lippincott, Philadelphia 1969, pp. 604-621.

³⁰ For an in-depth review of this issue, see Friedrich Paul Berg, “Blue Women on the Beach,” Oct. 1, 2004; <https://codoh.com/library/document/1703/> and in particular: Thomas Kues, “Skin discoloration caused by carbon monoxide poisoning,” Dec. 15, 2008; <https://codoh.com/library/document/657/>.

The Gerstein statement, to its credit, does not claim that carbon monoxide was the lethal ingredient in the Diesel exhaust. It is the post-war exterminationists, hence those who sustain the orthodox narrative, who insist that death was due to the carbon monoxide in the Diesel exhaust. The recurrence of references to “bluish” corpses in several other examples of so-called ‘eyewitness testimony’ from West German trials merely demonstrates the ‘copy-cat’ nature of much of that testimony. That such testimony has been accepted by West German courts specializing in Holocaust-related cases and by the Holocaust scholars, apparently without any serious challenge, merely demonstrates the shoddiness of those trials and the pseudo-scholarship which pervades the subject in general.

If the corpses had indeed appeared “blue,” death certainly would not have been due to carbon monoxide poisoning. A bluish appearance could, however, have been an indication of death from asphyxiation, i.e., from lack of oxygen.

According to Léon Poliakov, a French-Jewish historian who has written at length in support of the Holocaust story,

“[...] there is little to add to this description [the Gerstein Statement], which holds good for Treblinka and Sobibor as well as for the Belzec camp. The latter installations were constructed in almost the same way and also used the exhaust carbon monoxide gases from Diesel motors as death agents.”

According to Poliakov, more than a million and a half people were killed with Diesel exhaust.³¹

When the crimes allegedly committed at Belzec became the focus of the post-war German judiciary, a court handling the case, after evaluating several witness statements in this regard, also decided that murder at Belzec had been committed with a Diesel engine.³²

A marvelous attempt at evasion and distortion took place in 1983 when a group of twenty-four of the world’s leading orthodox Holocaust ‘scholars’ tried to obscure the Diesel claim for Belzec by omitting all four passages of Gerstein’s statement where that engine type is mentioned.³³ Not even Gerstein’s detailed description of the alleged killing process is quoted.³⁴ For such a description, the book gives instead a piece of post-war testimony by Dr. Pfannenstiel mentioned earlier.²⁵

This extremely pretentious book represents the state of Holocaust mythomania in the first half of the 1980s and was recommended by the World Jewish Congress in London.³⁵ For example, the next to last chapter titled “The Two Poison Gases” (*Die zwei Giftgase*) even gives the molecular weight of CO, twice, as well as many other totally irrelevant technical properties of CO and HCN. Many readers were no doubt impressed.

That the Gerstein Statement, even in a severely and fraudulently abbreviated form, was included in *Nazi Mass Murder* at all only shows how desperate the Holocaust scholars are to scrape together anything and everything in support of their monstrous fantasy.

³¹ L. Poliakov, *Harvest of Hate*, *op. cit.* (note 18), p. 196. Further typical and fundamental sources that speak of the use of tank or Diesel engines include: “The Treblinka Hell,” in: Vassili Grossman, *The Years of War (1941-1945)*, Foreign Languages Publishing House, Moscow 1946, pp. 393f.: death occurred within 10-25 minutes due to tank engine exhaust, sometimes also due to vacuum and steam; Eliahu Rosenberg, *Tatsachenbericht*, Jewish Historical Documentation, Dec. 24, 1947, p. 4: mass murder with Diesel engine exhaust within 20-35 minutes (published in H. P. Rullmann, *Der Fall Demjanjuk*, Verlag für ganzheitliche Forschung und Kultur, Struckum 1987, pp. 133-144); World Jewish Congress *et al.* (eds.), *The Black Book: The Nazi Crime against the Jewish People*, Duell, Sloan & Pearce, New York 1946; reprint by Nexus Press, New York 1981: no fewer than 3 million victims in Treblinka due to carbon monoxide from tank engines, sometimes also due to vacuum and steam.

³² A. Rückerl, *NS-Vernichtungslager...*, *op. cit.* (note 28), pp. 61, 64, 133. Cf. also in H. Lichtenstein, *Im Namen des Volkes?*, Bund, Cologne 1984, pp. 187f. (death after 15 minutes due to Diesel exhaust gas in gas-tight chamber in Belzec).

³³ The book instead contains a general, fuzzy statement about the engine type: E. Kogon, *et al.* (eds.), *op. cit.* (note 25), p. 153: “ein autonomes Vernichtungssystem auf der Grundlage von normalem und überall erhältlichem Benzin und Dieselmotorkraftstoff”; English: *Nazi Mass Murder*, Yale University Press, New Haven 1993, p. 109: “a system of extermination based on ordinary, universally available gasoline and diesel fuel.”

³⁴ E. Kogon *et al.* (eds.), *op. cit.* (note 25), pp. 171-174/129-131.

³⁵ *Chicago Jewish Sentinel*, Dec. 22, 1983.

Other prominent orthodox scholars stood firmly to the Diesel engines, however. Raul Hilberg, for instance, wrote the following in the third and last edition of his *opus magnum* *The Destruction of the European Jews*:³⁶

“Later, Belzec is reported to have been equipped with a diesel motor; Treblinka is said to have had one from the start; and Sobibor began with a heavy, eight-cylinder 200+ horsepower, water-cooled Russian gasoline engine [...].”

The 1993 *Enzyklopädie des Holocaust*, edited by some of the finest orthodox scholars the world could muster, wrote about Belzec that it was equipped with a “Diesel motor with 250 HP.”³⁷

The only witness who does not speak of a Diesel engine but rather of a gasoline engine in connection with Belzec is Rudolf Reder, one of the very few Belzec inmates ever to testify. In a book he authored, he stated that the machine used at Belzec somehow used gasoline, but he didn’t know what that machine actually did.³⁸

“All I saw were canisters of gasoline. [...] We believed that the machine either produced high pressure or created a vacuum, or that gasoline produced carbon monoxide which killed the people.”

In other words, Reder, who claims to have been in Belzec for almost four months, hadn’t figured out at all how the mass murder was committed. In fact, the various statements he made in this regard over the years all contradicted one another.³⁹ When questioned as a witness by Polish Judge Jan Sehn on Dec. 29 1945, however, Reder described the scene after a gassing in Belzec as follows:⁴⁰

“The bodies in the [gas] chamber did not show any unnatural discoloration. They looked like live persons; most had their eyes open. Only in a few cases were the corpses blood-stained. The air in the chambers, when they were opened, was pure, transparent and odorless. In particular, there was no smoke from the exhaust gas of the engine. The [exhaust] gas was evacuated from the engine directly into the open air, and not into the chambers. [sic!]”

Hence, whatever that machine did next to which he saw canisters of gasoline – how could he even know they contained gasoline rather than diesel, for instance, or ethanol, or any other liquid? – one thing is for sure: its exhaust gases weren’t used to kill anyone.

A thorough analysis of Reder’s book *Belżec* has clearly demonstrated the fictional nature of much of its contents, including the claim that 2.5 million people were killed at Belzec.⁴¹ Add to this that he claimed – just like Gerstein – that the victims went into the gas chamber “naked, barefoot, even in winter and on the snow,” even though Reder had never been in Belzec during winter time; in fact, gassing operations in Belzec are said to have started in spring 1942 and ended in fall 1942, so there was never a time when people went into the chambers during winter... Or take Reder’s claim in a 1944 article that the gassing facility

Mattogno, *op. cit.* (note 39).

made of concrete measured $100\text{ m} \times 10\text{ m} = 1,000\text{ m}^2$,⁴² something utterly at odds with any other witness testimony. And so, it goes on.

We have one competent yet evidently untrustworthy witness – the engineer Gerstein – talking about Diesel exhaust being used for the murder, and an observer with no special knowledge who is utterly untrustworthy – Reder – expressly saying that the exhaust gases of a gasoline-consuming machine were *not* used for the murder.

4.2. Sobibor

As we have seen earlier, Hilberg insisted that Sobibor had a 200+ HP gasoline engine. The *Enzyklopädie des Holocaust* claims that Sobibor was equipped with a “200 PS-Motor” without specifying the type.⁴³ During a German trial of alleged Sobibor perpetrators, one witness claimed that he helped procure and install a motor which he described as follows:⁴⁴

“It was a heavy Russian gasoline engine (probably a tank or train engine) of at least 200 horsepower (V-engine, eight cylinders, water cooled).”

There are other witnesses, however, who mentioned Diesel motors for Sobibor. Orthodox scholars have tried to explain this away by claiming that “information about diesels was spread through rumours.”⁴⁵ But if the witnesses were presenting rumors as “information” or “knowledge,” what is their testimony worth? The same, of course, can also be said about the presence of gasoline engines: “knowledge” about their alleged presence may have been spread through rumors as well. And worse still: the entire engine-exhaust gassing narrative may have been spread through rumors. Oy vey!

4.3. Treblinka

Claims of Diesel motors having been used at the Treblinka Camp are based, for instance, on findings of the German court in Düsseldorf dealing with the Treblinka Case, relying on multiple witness testimony.⁴⁶ The *Enzyklopädie des Holocaust* wrote about Treblinka that it was equipped with a “Diesel motor,”⁴⁷ although there is one (!) dissenting voice who spoke of a gasoline engine.⁴⁸ Finally, in the criminal court case in Jerusalem against John Demjanjuk, who was accused of having assisted in the murder of hundreds of thousands of victims, the verdict, based exclusively on numerous witness testimonies, concluded twice that the murder weapon was indeed a Diesel engine.⁴⁹

5. Toxic Effects of Carbon Monoxide

To investigate the Diesel gas chamber claim, the two most important questions are:

- How much carbon monoxide is actually needed to kill a human being in half an hour?
- Does Diesel exhaust ever contain that much carbon monoxide?

⁴² “Wieczne ognie Bełżca” (“The Eternal Fires of Bełżec”), in: *Czerwony Sztandar*, Nov. 1, 1944, p. 2.

Table 2: Toxic Effects of Carbon Monoxide (CO)⁵¹

PARTS OF CO PPM OF AIR	CO IN %/VOL.	PHYSIOLOGICAL EFFECTS
100	(0.01)	Allowable concentration for an exposure of several hours
400 to 500	(0.04 – 0.05)	Inhalation for up to 1 hour without appreciable effect
600 to 700	(0.06 – 0.07)	Appreciable effect after exposure of 1 hour
1,000 to 1,200	(0.10 – 0.12)	Indisposition but no dangerous effects after exposure of 1 hour
1,500 to 2,000	(0.15 – 0.2)	Dangerous concentrations for exposure of 1 hour
4,000 and more	(0.4 and more)	Fatal in exposure of less than 1 hour

This chapter will address the first question, while the second question will be examined in Chapters 6 through 8.

Carbon-monoxide poisoning has been thoroughly studied since about 1920 when it was carefully examined to determine the ventilation requirements of tunnels for motor vehicles, particularly for the Holland Tunnel in New York City. Since the early 1940s, it has been widely accepted on the basis of the research of Yandell Henderson and J. S. Haldane that, *given a normal oxygen content of the air*, an average carbon-monoxide concentration of “0.4% and above,” as shown on the last line of Table 2, is needed to kill people in “less” than one hour of continuous exposure.⁵⁰ Concentrations of 0.15%/vol. to 0.20%/vol. are “dangerous,” which means they might kill some people in one hour, especially if those people have, for example, weak hearts. But in order to commit mass murder in a gas chamber, one would need a concentration sufficient to kill not merely a *portion* of any given group of people but rather sufficient to kill them *all*. The prospect of ‘survivors’ of a gassing being ‘regassed’ later on or disposed of in some other way is too ridiculous to be taken seriously.

The vagueness introduced by Henderson’s use of the term “less” is unfortunate. It arises from the fact that, although Henderson and others could test for non-lethal effects in a laboratory with a high degree of accuracy, the lethal effects could not be tested in the same way. The lethal effects and the corresponding CO levels were determined by careful extrapolation of carboxy-hemoglobin levels over time from non-lethal tests on humans as well as from some lethal tests on animals. Although the concentrations given for lethal effects are not as precise as one might wish, they are still sufficiently accurate to support some important conclusions about Diesel gas chambers.

According to the exterminationists, the gassing was always done in about half an hour or less.⁵²

To determine the carbon monoxide concentration needed to kill in only half an hour instead of a full hour, one can use a widely accepted rule of thumb known as “Henderson’s Rule,” which is:

$$\text{\%/vol. CO} \times \text{exposure time} = \text{Constant for any given toxic effect.}$$

where %/vol. CO refers to percent by volume of CO in air. All percentages subsequently given refer to percent by volume.

In other words, for any given toxic effect, the poisonous concentration must be inversely proportional to the time of exposure. This means that, to kill in half an hour, one needs twice the concentration that one would need to kill in a full hour. Applying this rule to the “0.4% and more” needed to kill in “less than 1 hour,” we get 0.8%/vol. as the minimum concentration needed to kill in less than half an hour.⁵³

⁵⁰ W. Braker, A. L. Mossman, *Effects of Exposure to Toxic Gases*, Matheson Gas Products, East Rutherford 1970, p. 12; 2nd ed., D. Siegel, Lynhurst, N.J., 1977.

⁵¹ Y. Henderson, H. W. Haggard, *Noxious Gases*, Reinhold Publishing, New York 1943, p. 168.

⁵² According to the eyewitness statements in E. Kogon *et al.* (eds.), *op. cit.* (note 25), the gassing procedure allegedly sometimes took much less time: p. 159/113 (E. Fuchs, 10 mins.), p. 167/119 (K.A. Schluch, 5-7 mins.), p. 174/131 (K. Gerstein, 18 mins.; this is from a different version of Gerstein’s “confession” which is less detailed about the actual gassing procedure than the one quoted here in Chapter 3; cf. note 17), p. 181/127 (A. Goldfarb, 20-25 mins.); in accordance with Gerstein’s half an hour: Matthes, in H. P. Rullmann, *op. cit.* (note 31), p. 167: 30 min.

⁵³ F. E. Camps, *Medical and Scientific Investigations in the Christie Case*, Medical Publications Ltd., London 1953, p. 170.

Chart 1: Toxic effect of small amounts of carbon monoxide.⁵⁴ Right: original chart; top: with additional values extrapolated by the author, in particular those with CO concentrations above 0.06%.

Applying the same rule to the 0.15 to 0.20%/vol. range, which is “dangerous” for one hour of exposure, we get 0.3%/vol. to 0.4%/vol. as the range of CO concentration, which is dangerous for half an hour of exposure.

What all this means is that, to have any kind of practical gas chamber using carbon monoxide as the lethal agent, one needs an average concentration of at least 0.4%/vol. carbon monoxide – but, possibly as much as 0.8%/vol. We should keep ‘0.4% to 0.8%’ in mind as benchmark numbers to which we will refer shortly. Please note that these data hold true only in the presence of a *normal oxygen content* of the air!

If one were to reduce the oxygen content by half for example – from the normal 21%/vol. to only 10.5%/vol. – any given concentration of CO will be twice as toxic. Even a CO concentration of only 0.2%/vol. would then suffice to kill in one hour. So, in order to determine the actual effectiveness of a given concentration of CO, it is necessary to see it in relation to the actual oxygen concentration present. To properly use the values shown in our tables and graphs, one must determine the CO content that would have the same effect with a normal oxygen level as the actual CO content with reduced oxygen. This concentration, which we

⁵⁴ P. S. Myers, “Automobile Emissions – A Study in Environmental Benefits versus Technological Costs,” *Society of Automotive Engineers Transactions* 79 (1970), Section 1, Paper 700182, pp. 657-675, here p. 662.

Table 3: Hemoglobin-Carbon Monoxide Level of CO-Victims ⁵⁵								
Hb·CO [%]	AGE OF VICTIMS [YEARS]							Sum
	18-30	30-40	40-50	50-60	60-70	70-80	80-90	
40-50	—	—	—	—	—	7	4	11
50-60	2	—	1	3	1	5	5	17
60-70	7	2	6	12	10	8	—	45
70-80	5	2	5	7	8	—	—	27
Total:	14	4	12	22	19	20	9	100

shall call the “effective CO-concentration,” or $c(\text{CO}_{\text{eff}})$, is determined by multiplying the actual CO-concentration, or $c(\text{CO})$, by the ratio of the normal oxygen content (21%) to the actual oxygen content ($x\%$):

$$c(\text{CO}_{\text{eff}}) = c(\text{CO}) \times \frac{21\%}{x\%}$$

Another important consideration is always the *average concentration* over the entire time of exposure, and not some quantity of poison measured in pounds or cubic feet. In our current discussion, this is a problem, since to determine the concentration one would like to know the volume of the gas chamber which is not really possible here due to the general lack of reliable information for the alleged Nazi Diesel gas chambers as discussed here. Neither is it possible to solve this problem by determining an absolute quantity of poison instead of a concentration value. The few data regarding gas chamber size which we do have for example from the Gerstein Statement are so unbelievable that there is no point in trying to work from them. But we do know that the average CO concentration will always be less than the CO concentration measured directly on the exhaust pipe of the Diesel engine.

Chart 1 gives the symptoms from various low-level carbon monoxide exposures as a function of duration of exposure. The highest CO concentration discussed is 600 ppm (parts per million). 600 ppm is another way of saying 0.06%/vol. The chart shows that, after one hour of exposure to an average concentration of 600 ppm of CO, one would experience a headache, but not a throbbing one. Even after 100 hours of exposure, the worst that one would experience would be unconsciousness, but not death. However, after only half an hour of exposure to 600 ppm, no symptoms are indicated at all – not even a mild headache. We should keep ‘0.06%’ in mind as another benchmark number to which we will refer later in this chapter.

To obtain more reliable data about the effects of a higher CO content in exhaust than those extrapolated in Chart 1, one can consult accident and suicide statistics. Accident or suicide victims who died from carbon monoxide are frequently tested for

Chart 2: 100 cases of CO poisoning, Hb·CO versus age.

⁵⁵ Keith Simpson (ed.), *Taylor’s Principles and Practice of Medical Jurisprudence*, J. & A. Churchill, London 1965, pp. 366f.; Chart 2 originally appeared in K. Simpson, R.A. Furbank, *Journal for Medicine*, 2 (1955), p. 5.

the carboxy hemoglobin (Hb·CO)⁵⁶ in their blood.

Table 3 shows the Hb·CO levels of carbon-monoxide victims from a study published in 1970. In the literature of toxicology, 60% Hb·CO is generally cited as the fatal level (cf. Chart 1). According to Table 3, more than ¼ of all people would be dead at this concentration. Almost another 50% die at levels up to 70% Hb·CO, and the last quarter would die only when the concentration had increased to 80% Hb·CO (see also the scattergram Chart 2). So, to build an effective CO execution gas chamber which, in keeping with eyewitness testimony, kills everyone within half an hour – even young, healthy people with good nerves – the chamber would have to reliably induce a level of 80% Hb·CO within that time. An average CO content of 0.4% by volume in the gas chamber air would be the absolute minimum required (cf. Chart 1).

What any would-be National-Socialist mass murderers needed to achieve with their carbon-monoxide gas chambers is called by toxicologists the “LD₁₀₀”, the lethal dose for killing 100% of the victims. The concrete implications of this can be seen from the statistical analysis of the above-mentioned study of 100 deaths from carbon monoxide poisoning.

6. The Diesel Engine

6.1. Introduction

Although information as to engine type and size might be considered essential in the investigation of any ordinary murder, such details are just too much to expect when one is dealing with the orthodox Holocaust narrative. The most frequent claim, however, is that the engines were Diesels from Soviet tanks.⁵⁷ Without more specific information, we must investigate the broader and far more difficult question of whether or not *any* Diesel ever built could possibly have done the abominable deed.

If Gerstein had claimed that the carbon monoxide was generated by gasoline engines, his story would be more credible. Gasoline engines can indeed kill rather easily and with little or no warning because their exhaust is almost odorless. Although Diesel engines look like gasoline engines, at least to most people, they are actually quite different. Any mining engineer or mine surveyor, such as Gerstein was, should certainly have been able to easily distinguish between the two types of engines. For one thing, the sound of Diesels is so distinctive that almost anyone with a little experience can recognize them with his eyes closed.

When Diesels are running, they actually warn us of their presence: their exhaust smells terrible. In other words, every Diesel engine comes with its own built-in ‘warning ingredient.’ The intensity of the smell or stench has, no doubt, given rise to the thoroughly false impression that Diesel exhaust must, therefore, be very harmful.

The simple-minded but false logic which guides Holocaust believers is that, since gasoline engine exhaust can certainly kill, even though it has little odor, Diesel exhaust, which has an intense odor, must be extremely deadly. The fact is, however, that there is absolutely no relationship between smell and toxicity since the most lethal exhaust-gas ingredient by far is CO which is totally odorless. Although Diesel exhaust is not totally harmless, it is one of the least harmful pollutants anywhere except for some possible long-term carcinogenic effects, which are totally irrelevant for any gas chamber for mass murder.

⁵⁶ Hb·CO – hemoglobin-carbon monoxide compound, the compound formed by CO and blood hemoglobin, whereby the oxygen (Hb·O₂, oxyhemoglobin) becomes displaced.

⁵⁷ The Soviets used gasoline engines in some of their tanks (models BT, T 28, T 35). Soviet Diesel engines first appeared in 1939 in the T-34 Stalin tank and surprised everyone outside the Soviet Union at the beginning of the German-Soviet war (The heavy tanks KW Ia and KW II had Diesel engines, too). The heavy Diesel engine of the T 34, model “W2,” was a V12 cylinder Diesel (undivided chamber) with 550 hp, 38.86 l cubic capacity and a maximum 1900 rpm; cf. Augustin, *Motortechnische Zeitschrift* 5(4/5) (1943), pp. 130-139; *ibid.*, 5(6/7) (1943), pp. 207-213; *ibid.*, 6(1/2) (1944), p. 40; and H. Scheibert, *Der russische Kampfwagen T-34 und seine Abarten*, Podzun-Pallas Verlag, Friedberg 1988. Diesel engines from Soviet submarines are also mentioned: Jochen von Lang, *Eichmann Interrogated*, Farrar, Straus & Giroux, New York 1983, p. 75 (German ed.: *Das Eichmann-Protokoll*, Severin und Siedler, Berlin 1982, p. 72); see also Hannah Arendt, *Eichmann in Jerusalem*, Reclam-Verlag, Leipzig 1990, p. 181, who quotes a statement Eichmann made during the trial. Alleging the use of a large submarine engine in the heart of Poland is ridiculous and merely shows what to think about such statements.

Until the late 1990s, Diesel emissions have been well within the air-emission standards of the U.S. Environmental Protection Agency without any modifications or accessories.⁵⁸ However, concerns over cancer from Diesel exhaust have made the issue quite complicated in recent years, but those concerns are only for long-term effects. In any event, Diesels have always produced far less than 1%/vol. carbon monoxide, which is still the CO standard for all internal combustion engines. Gasoline engines have only met the same standard after many years of intensive research and the addition of many engine modifications and complex accessories including catalytic converters.

Chart 3 compares carbon monoxide emissions from Diesel and gasoline engines. The latter are also called spark-ignition engines because they use spark plugs. Clearly the logical choice between the two types of engines as a source of carbon monoxide would always have been the gasoline engine. From spark-ignition or gasoline engines, one can easily get 7%/vol. carbon monoxide – and with maladjustment of the carburetor, as much as 12%/vol. carbon monoxide – but from Diesel engines one can never get so much as $\frac{1}{2}$ %/vol. with liquid fuels, except during overloading.

Carbon monoxide emissions from internal combustion engines are commonly plotted as functions of air/fuel ratio or fuel/air ratio. Fuel/air ratio is merely the reciprocal of air/fuel ratio.⁶⁰ It has generally been accepted by the automotive experts that the CO level of Diesel exhaust is related chiefly to these ratios and not to other factors, such as rpm.

An air/fuel ratio of 100:1, for example, means that for every pound of fuel burned, 100 pounds of air are drawn into the engine. However, only about 15 pounds of air can ever react in any way chemically with each pound of fuel regardless of the air/fuel ratio or even the type of engine. This means that, at an air/fuel ratio of 100:1, there are always about 85 pounds of air which do not react. These 85 pounds of excess air are blown out of the engine without undergoing any chemical change at all.⁶¹ As far as the excess air is concerned, the Diesel engine is nothing more than an unusual kind of blower or compressor. In addition, there are no adjustments that one can make on a Diesel to mistune the engine to change the exhaust emission levels.⁶²

Gasoline engines always operate with an air deficit. As a direct result of this deficit, the combustion process in gasoline engines cannot possibly go to completion; a significant proportion of carbon monoxide to carbon dioxide will always be formed.

Chart 3: Comparison of carbon monoxide emissions from Diesel and internal combustion engines.⁵⁹

⁵⁸ In Germany as well, the emission levels from Diesel engines have always been below the threshold values set by the Federal Emissions Regulation. This is why Diesels were the only kind of engine to be exempt from the mandatory use of catalytic converters until 1994.

⁵⁹ David F. Merrion, "Effect of Design Revisions on Two Stroke Cycle Diesel Engine Exhaust," *Society of Automotive Engineers Transactions* 77 (1968), paper 680422, pp. 1534-1545, here p. 1535.

⁶⁰ M. A. Elliott, R. F. Davis, "Composition of Diesel Exhaust Gas," *Society of Automotive Engineers Quarterly Transactions* 4(3) (1950), pp. 330-346, here p. 345. Unfortunately, some of the following graphs use air/fuel, some fuel/air ratios, so we are forced to use them both here. An air/fuel ration of 18:1 equals a fuel/air ration of 0.055 (20:1 = 0.05, 25:1 = 0.04, 33.3:1 = 0.03 ...)

⁶¹ Except for small amounts of the air's nitrogen reacting with the oxygen to form various kinds of nitrogen oxides, but this is of no concern for the present study; see Subchapter 7.4.

⁶² Over the years, a number of exterminationists have falsely speculated that Diesels could simply be adjusted somehow by perhaps turning a screw somewhere or by changing the injection timing to give high CO emission levels. If it were that easy, it would be of great concern to auto emission inspectors but it is of no concern at all. The excess air in the cylinders and exhaust drives the combustion process toward near perfection. There is no basis anywhere in the automotive literature for such an exterminationist argument. Let the exterminationists try to find such evidence in the literature or anywhere else. The EPA will be extremely interested.

Diesels by contrast always operate with excess air. At idle, Diesels operate with air/fuel ratios as high as 200:1. At full load, the air/fuel ratio is still only down to 18:1. Because of the abundance of air, there is always far greater opportunity for the fuel to burn to completion, thereby producing hardly any carbon monoxide. What little carbon monoxide is produced in the cylinders of a Diesel is diluted by the excess air, if compared to gasoline engines.

Each cylinder of a Diesel either misfires or fires. If a cylinder misfires, the fuel will simply be blown out as vapor and produce no CO at all. When it does fire, the fuel will always burn to near perfection because of the excess air which is always present. Maladjustment, or faulty injection timing, or defective valves have no significant effect on CO levels for the same reason: the excess air reacts with nearly all of the remaining CO to form carbon dioxide.

As soon as one understands the true differences between Diesel and gasoline engine combustion, the logical choice as a source of carbon monoxide will always be the gasoline engine. The Diesel engine is always an inherently ludicrous choice as a source of carbon monoxide.

One could, of course, posit that the Germans didn't know all that during the war, even though they were the ones who invented all these engines: the Otto engine = gasoline engine is as much a German invention as the Diesel engine (and also the Wankel engine, the jet engine and the rocket engine).

During his research leading to the publication of his study on the Treblinka Camp,⁶³ Italian scholar Carlo Mattogno unearthed a German investigation into the toxicity of engine exhaust conducted under the aegis of the German Imperial Office of Health as well as the I.G. Farbenindustrie Trust, and involving some of Germany's finest scholars. The results of this series of toxicological and hygienic experiments were published in 1930 as a monograph under a title translating to *Toxicology and Hygiene in the Field of Motor Vehicles*.⁶⁴ Since Diesel engines were considered harmless, all the experiments were performed using gasoline engines. Detailed chemical analysis showed clearly that the exhaust gases of idling gasoline engines contain between 5% and 10% of CO, while this value goes down to less than 2%, even to 0.2%, when running the engine under full load.⁶⁵ The experiments included test gassings of mice and guinea pigs in custom-manufactured miniature gas chambers.

We must conclude from this that, by the 1930s at the latest, German scholars and government officials knew about both the harmlessness of Diesel-engine exhaust and the lethality of gasoline-engine exhaust.

6.2. Divided Chamber Diesels

There are basically two types of Diesel engines: divided combustion chamber and undivided combustion chamber. The divided chamber category of Diesel engines is generally subdivided into pre-combustion chamber designs and turbulent cell designs.

Chart 4 shows a pair of emission curves for Diesels with divided combustion chambers (Engine A and B).⁶⁶ These curves were the result of exceptionally careful tests made in the early 1940s in the United States by the U.S. Bureau of Mines (USBM) to determine whether or not Diesel engines could operate underground without endangering miners.⁶⁷ The conclu-

⁶³ C. Mattogno, J. Graf, *Treblinka: Extermination Camp or Transit Camp?* 4th ed., Castle Hill Publishers, Bargoed 2023, pp. 123-125.

⁶⁴ E. Keeser, V. Froboese, R. Turnau, E. Gross, E. Kuss, G. Ritter, W. Wilke, *Toxikologie und Hygiene des Kraftfahrwesens*, Schriften aus dem Gesamtgebiet der Gewerbehygiene, Issue 29, Julius Springer Verlag, Berlin 1930.

⁶⁵ *Ibid.*, pp. 4f., and Table I on p. 26. The oxygen content during idling was between 3.5% and 0.7%.

⁶⁶ In the past 50 years, the data used for Charts 4 and 5 have been repeatedly used in the technical literature by numerous engineers. This shows, on the one hand, how reliable the data are that were used for this graph. On the other hand, it also underlines the nature of this data as the worst possible emission curves of Diesel engines. Two earlier works which drew on this data are: H. H. Schrenk, L. B. Berger, "Composition of Diesel Engine Exhaust Gas," *American Journal of Public Health* 31(7) (1941), pp. 669-681, here p. 674; and Martin A. Elliott, "Combustion of Diesel Fuels," *Society of Automotive Engineers Quarterly Transactions* 3(3) (1949), p. 509.

⁶⁷ While the experiments involved, and their purpose, were discussed in numerous articles, the paper by J. C. Holtz, "Safety with mobile Diesel-powered equipment underground," *Report of Investigations No.*

Chart 5 (top): CO emissions from an undivided chamber Diesel engine (C)⁶⁹
Chart 4 (left): CO emissions from two different types of Diesel engine: a pre-combustion chamber Diesel (A), a turbulent cell Diesel engine (B).⁶⁶

sion of the USBM had been, at least until the 1970s’ energy crisis, that Diesels could operate underground in non-coal mines subject to USBM approval of the engines. Today, Diesels are also widely used in U.S. coal mines. The earlier exclusion of Diesels from US coal mines had nothing whatever to do with health and safety considerations, but job security for coal miners and the political persuasiveness and eloquence of John L. Lewis, the charismatic president of the miners’ union who had insisted: “no Diesels in UMWA mines.”⁶⁸

The lower curve in Chart 4 is for a pre-combustion chamber Diesel (Engine A). The upper curve is for a turbulent cell Diesel (Engine B). The lowest fuel/air ratio always corresponds approximately to idle and a ‘no-load’ condition. At idle, neither of these types of Diesels could produce enough carbon monoxide to even give a headache after half an hour of continuous exposure.

As one starts to impose loads on these engines, and in effect increases the fuel/air ratios, the carbon monoxide levels actually decrease at first. Only as one approaches full load, represented by the solid heavy line added by me to each chart, do the carbon monoxide levels rise significantly to a maximum of 0.1%/vol. at a fuel/air ratio of 0.055 (air/fuel ratio 18:1). The solid heavy vertical line represents the safe maximum of the ratio set by engine manufacturers.

⁶⁹ 5616, U.S. Department of the Interior, Bureau of Mines, Washington, D.C., 1960, p. 67, is probably the best; cf. Holtz, R. W. Dalzell, “Diesel Exhaust Contamination of Tunnel Air,” *Report of Investigations No. 7074, ibid.*, 1968.

⁶⁸ The earlier exception for coal mines arose not from true health and safety considerations but from the political pressure of the United Mine Workers Union which saw all liquid fuels as an existential threat to their jobs. Diesel locomotives had cost the UMWA thousands of jobs. Electrically-driven vehicles and equipment, with lengthy power cables, derived their energy from coal burned in electric power plants and were, therefore, entirely acceptable to the union. S.O. Ogden “The War over Diesels,” *Coal Mining & Processing*, 15(6) (June 1978), p. 102; see also Frank E. Scott, “Diesel underground: Overcoming a bad image,” *Coal Mining & Processing*, 19(8) (August 1982), p. 45.

6.3. Undivided Chamber Diesels

The emission curve in Chart 5 (Engine C) shows that an undivided chamber Diesel still produces only about 0.03%/vol. carbon monoxide at idle, which is not enough to cause a headache in half an hour.⁶⁹ However, as increasing loads are imposed on such an engine, the carbon monoxide levels do eventually rise rather sharply. At full load, again represented by the heavy vertical line, the carbon monoxide level is indeed at about 0.4%/vol. In other words, here we have a Diesel which looks as if it could have been used to commit mass murder in half an hour.

The problem for this engine, and for all Diesels, is that to operate *at full load continuously* for long periods, such as half an hour, one risks fouling and damage from accumulated solids inside the cylinders. If one operates at lower and safer fuel/air ratios than 0.055, meaning with lower loads, the carbon-monoxide emission levels drop very dramatically. For example, at 80% of full load, which is generally regarded as the safe maximum for continuous operation and which occurs at a fuel/air ratio of about 0.045 (air/fuel ratio \approx 22:1), the carbon monoxide level is only 0.13%.

That the emission curves in Charts 4 and 5 are indeed typical of all Diesel engines over the last seventy years is attested to by the fact that these particular curves have been referred to in countless journals and books on Diesel emissions. In other words, there are no better examples of Diesel emissions. To be sure, there are many other test results in reputable automotive engineering journals such as the *Society of Automotive Engineers Transactions*. But if one takes the trouble to look through the *SAE Transactions* of the last seventy years as well as through other journals, one will not find any examples of worse carbon-monoxide emissions than the curve in Chart 5 for Engine C. Our analysis of Engine C represents the worst case that anyone is likely to find anywhere, for any Diesel engine.⁷⁰

6.4. Fuel/Air Ratios, Load, and the Internal Speed Governor

One might think that all one has to do to get a high fuel/air ratio is to press the fuel pedal to the floor – without any external load being coupled to the engine. What happens then, as the fuel pedal is simply pressed ‘to the metal,’ is that the fuel/air ratio will indeed go to the maximum that the fuel injection stop setting will allow and, because of that, the engine speed will rapidly increase as well. Within a few seconds, the engine speed will approach the maximum safe engine speed set by the manufacturer. Long before that speed is reached, however, an internal speed governor in the fuel injection pump assembly will restrict the fuel supply – and quite severely – to protect the engine by ensuring that the maximum safe engine speed or ‘redline’ speed is never exceeded. After a brief moment of revving the engine, the actual fuel/air ratio at ‘high-speed idle’ will stabilize after a few seconds, since there is no load, to nearly the exact same low fuel/air ratio as at ‘low speed idle.’ At high-speed idle, more fuel will be consumed per second, but because more air is also being drawn into the engine, the fuel/air ratio will remain nearly the same as at low-speed idle. In other words, pushing ‘to the metal’ without an external load will not raise the fuel/air ratio, except during the initial acceleration phase.

To actually maintain a high fuel/air ratio for more than just a few seconds, either of two methods, or a combination thereof, is essential. One method involves coupling a load, such as a pump, fan or generator to the engine to hold the engine speed safely below the ‘redline’ speed. Another method is by ‘choking,’ which means restricting the air supply to the engine.

As a practical matter, coupling an external load to a typical truck or tank engine is far from easy. Nothing like it is even remotely suggested in any of the anecdotes or documents anywhere in the Holocaust literature. This method will be investigated more closely in Subchapter 8.1.

Reducing the air intake, however, is quite easy, but experiments have shown that this method still does not meet the necessary requirements, see Subchapter 8.2.

⁶⁹ Data taken from: M. A. Elliott, R. F. Davis, *op. cit.* (note 60), p. 333.

⁷⁰ D. Pankow, *Toxikologie des Kohlenmonoxids*, VEB Verlag Volk und Gesundheit, Berlin (East) 1981, p. 24, also states that Diesel engines under full load do not produce more than 0.4% CO by volume.

Chart 6: Composition of the exhaust from combustion engines.⁷¹ The heavy vertical line marking a fuel/air ratio of 0.055 (air/fuel ratio 18:1) has been added by the author.

7. Toxicology of Diesel Exhaust

7.1. Effect of Reduced Oxygen Content

Is it possible that the Jews died from reduced oxygen in the Diesel exhaust? Such a theory would at least be consistent with the claim that the corpses were “blue.” It requires, however, that the lack of oxygen was not substituted by the supply of CO. A bluish coloring to certain parts of a corpse is indeed a symptom of death from lack of oxygen, *if CO is excluded*. This theory is not very likely, however, as the victims would then have suffocated in the gas chamber without being gassed.

Normal air contains 21%/vol. oxygen. In Chart 6 we see that the oxygen concentration corresponding to idle in the exhaust of any Diesel engine (divided or undivided chamber), shown at the right in the graph at an air/fuel ratio of 100:1 (fuel/air ratio 0.01), is 18%, which is just a few percent less than one finds in normal air.⁷¹ At full load (fuel/air ratio 0.055), the oxygen concentration in the exhaust of any Diesel engine is approximately 4%.

⁷¹ Edward F. Obert, *Internal Combustion Engines and Air Pollution*, Intext Educational Publishers, New York 1973, p. 361.

Table 4: Effective CO-Content of Diesel Exhaust ⁷⁶					
Load Range	Fuel/Air (Air/Fuel) Ratio	O ₂ Content [%/vol.]	CO _{max} Content [%/vol.]	F _{O₂}	CO _{eff} [%/vol.] at 21%/vol. O ₂
full load	0.055 (18:1)	4.0	0.400	5.25	2.100
	0.05 (20:1)	6.0	0.220	3.50	0.770
heavy load	0.04 (25:1)	8.8	0.090	2.40	0.220
	0.03 (30:1)	10.8	0.080	1.94	0.160
partial load	0.029 (35:1)	12.0	0.075	1.75	0.130
	0.025 (40:1)	13.5	0.070	1.55	0.110
light load	0.016 (60:1)	16.0	0.050	1.31	0.066
idle	0.01 (100:1)	18.0	0.060	1.17	0.070

Probably the best discussion of the effects of reduced oxygen levels, or asphyxia, is provided by Henderson and Haggard, according to whom an oxygen content of less than 10%/vol. causes loss of consciousness, and an oxygen content of less than 6%/vol. is fatal.⁷² According to Haldane and Priestley, “air containing less than 9.5 per cent of oxygen would ordinarily cause disablement within half an hour.”⁷³ But disablement is still not death!

Clearly, there is no magic number below which death would automatically occur, or above which life would necessarily continue. However, for any gas chamber relying upon reduced oxygen as the killing method, one would have to reduce the oxygen to below 9.5%/vol. and perhaps even below 6%/vol.

From Chart 6 we see that, to reduce the oxygen concentration in the exhaust to just 9%, any Diesel would have to operate at a fuel/air ratio of about 0.04, which corresponds to roughly ³/₄ of full load. To reduce the oxygen concentration to as low as 6%, a Diesel would have to operate at close to full load. In other words, any Diesel gas chamber relying *exclusively* on the reduction of oxygen as a killing method would have to operate at more than ³/₄ of full load.⁷⁴

From the above it is evident that, over most of their operating ranges, Diesels discharge sufficient oxygen so that one can literally inhale pure Diesel exhaust and survive. The smell would be brutally unpleasant, but not harmful. From idle to at least ³/₄ of full load, Diesel exhaust contains sufficient oxygen to sustain human life for at least half an hour.

7.2. Combined Effects of Carbon Monoxide and Reduced Oxygen

Table 4 (next page) shows carbon monoxide levels for various load ranges of the Diesel with the worst emission values, *i.e.*, Engine C from Chart 5. Since the oxygen content in the exhaust gas decreases with increasing load, it must also be taken into account as already described. When dividing the actual O₂ content in the exhaust by the normal oxygen content in air (21%), one gets a factor F_{O₂}. One can then multiply the actual CO content by this factor to determine the toxicologically effective CO content (see Chapter 5). Table 4 shows us that the desired, high effective CO content that *guarantees the death of all the victims* within half an hour (0.4 to 0.8%) can only be attained near full load.⁷⁵

7.3. Carbon Dioxide

If Jews were not killed with carbon monoxide or from a lack of oxygen, could they have died instead from the effects of carbon dioxide? Carbon dioxide is no more poisonous than

⁷² Y. Henderson, H. W. Haggard, *op. cit.* (note 72), pp. 144f.
⁷³ J. S. Haldane, J. G. Priestley, *Respiration*, Yale University Press, New Haven 1935, pp. 223f.
⁷⁴ Note: The composition of exhaust gasses is almost independent from the rpm’s of the engine. The rpm’s simply determine how *much* gas is produced. If the rpm’s are lower, for the same fuel/air ratio the whole process will take longer.
⁷⁵ One objection to my 1984 essay was that I had not properly considered the combined effects of carbon monoxide and reduced oxygen. If one determines an “effective carbon monoxide level,” as explained in this text, one will see that there is no significant increase in toxicity for half-hour exposures due to reduced oxygen until one gets the engine running under heavy loads which is exactly what I claimed in 1984.
⁷⁶ Based on the data from Graphs 4 and 5.

ordinary water. Most toxicology handbooks do not even mention it. When mentioned at all, it is generally classified as a “non-toxic, simple asphyxiant.” There are, however, occasional accidental fatalities where carbon dioxide is directly involved. Death in almost all such cases is caused by a lack of oxygen. The lack of oxygen arises from the fact that carbon dioxide is much heavier than oxygen and will, especially in an enclosed space, displace oxygen in the same way that water will displace air in the lungs of a drowning man. The actual cause of death in either situation is not the carbon dioxide or the water, but rather the lack of oxygen in the blood (suffocation). One symptom of this kind of death is a bluish appearance of the skin.

Carbon dioxide can be beneficial and therapeutic.⁷⁷ It is commonly used in clinical medicine as a harmless stimulant for respiration. For this purpose, it is supplied under pressure in cylinders (Carbogen) containing oxygen and 7%/vol. carbon dioxide.⁷⁸ Normally, when a person exhales, the air leaving the lungs contains about 5.5%/vol. carbon dioxide.

Levels of 3%/vol. carbon dioxide are quite tolerable for exposures lasting several days. For example, in the 1950s the U.S. Navy experimented with gas mixtures containing 3%/vol. carbon dioxide and 15%/vol. oxygen (25% less oxygen than in normal air) for use in American submarines with exposures lasting up to several weeks.⁷⁹

For Diesel engines, the carbon dioxide level at or near idle is only about 2%/vol. and gradually increases to about 12%/vol. at full load as shown in Chart 6 (page 438). A carbon dioxide level of 12%/vol. may cause cardiac irregularity and may, therefore, be dangerous for people with weak hearts.⁸⁰ In contrast to Diesels, gasoline engines produce 12%/vol. already at idle. In general, if enough oxygen is available, a carbon dioxide level even as high as 12%/vol. is not likely to cause death. It is generally accepted that only carbon dioxide concentrations greater than 20 to 30%/vol. are dangerous.⁸¹ However, when the carbon dioxide level is as high as 12%/vol. in Diesel exhaust, the corresponding oxygen level is dangerously low.

The principal danger to life from Diesel exhaust arises not from any secondary components, but strictly from the combined effects of CO and reduced oxygen.

7.4. Aldehydes, Sulfur Dioxide, Nitrous Oxides and Hydrocarbons

Other pollutants in Diesel exhaust, besides carbon monoxide, are primarily aldehydes (OCHR), sulfur dioxide (SO₂), nitrous oxides (NO_x, max. 0.1%), and hydrocarbons (C_xH_y). The smell or stench for which Diesel engines are notorious is caused by trace amounts of certain hydrocarbons and aldehydes which the most modern analytical instruments can barely identify, let alone measure. The sensitivity of the human nose to these compounds is, however, extremely high and out of all proportion to the actual quantities present. Some of the hydrocarbons are considered carcinogenic, and thus represent a potential long-term hazard, but they are irrelevant to our study.

The sulfur dioxide content of the exhaust, which can be fairly high for sulfurous fuels, causes irritation of the respiratory tract, but these irritations cannot become critical within the time frame at issue here.

Nitrogen dioxide (NO₂), if present in high concentrations, can cause edema of the lungs after half an hour's exposure. However, even the worst edema will not kill in half-an-hour, but only after a delay of about 24 hours.⁸² One-time, brief exposure to lower concentrations of NO₂, as considered here, merely irritate the lungs and mucous membranes, as do any sulfur oxides potentially present, so that we need not consider them further. Nitrogen monoxide (NO), on the other hand, has physiological effects similar to CO.⁸³ Unlike CO, how-

⁸³ W. Forth *et al.*, *op. cit.* (note 29), pp. 761, 765; M. Daunerer, *Klinische Toxikologie*, 34th supplement

ever, its concentrations decrease with decreasing oxygen concentrations in the combustion process, *i.e.*, with higher load, and do not attain any levels critical to health.⁸⁴ Furthermore, NO converts rapidly to NO₂,⁸⁵ so that the NO concentration enhances the effects of the CO in the exhaust only imperceptibly.

The peroxide-(ozone)-forming effects of nitrous oxides near ground level as well as the carcinogenic components of Diesel exhaust are the reason Diesel engines have recently also been subjected to special emission guidelines, yet not their danger to human respiration. This is why the studies conducted in Germany of health hazards posed by Diesel exhaust were almost entirely confined to analyses of the proportions of smoke solids and non-combusted hydrocarbons.⁸⁶

7.5. Diesel Smoke

Diesels tend to smoke, especially when run with high fuel/air ratios. This is not due to any inherent inefficiency of Diesels. On the contrary, Diesels are extremely efficient. The smoke is the result of the nature of Diesel combustion and the heavier fuels which Diesels use compared to gasoline engines.

The solid heavy lines in Charts 4 through 7 represent the smoke limit that engine manufacturers have found necessary to impose in order to protect their engines from excessive wear due to deposits of solids on the cylinder walls. As a practical matter, a Diesel cannot operate to the right of the vertical lines in Charts 4 and 5 with liquid fuels (fuel/air ratio of 0.055 = air/fuel ratio of 18:1) because the internal accumulations of smoke solids would destroy the engine within a short time and would stall the engine.⁸⁷ Many manufacturers are more conservative and limit their engines to fuel/air ratios below 0.050.

Diesel engines can operate safely at fuel/air ratios above 0.055 (air/fuel ratios below 18:1) only if they are burning a clean, gaseous fuel. This is the only way to avoid the buildup of solid material within the cylinders. The data shown to the right of the vertical line were only gathered because the researchers at the USBM chose to test their engines for theoretical reasons with gaseous, non-sooting fuel far beyond the normal (manufacturer-recommended), full-load settings of the respective engines.⁸⁸ The data for clean, gaseous fuel is irrelevant to our analysis, because if the Germans had had a gaseous fuel for the Diesel engines – for example, pure CO – they could have sent that gas directly to the gas chamber. Using a Diesel engine as some kind of intermediate step would make no sense; it could only have made the gas far less toxic. Since carbon monoxide is highly combustible and because of the excess air, practically all of the carbon monoxide going into the Diesel would get consumed.

Diesel smoke contains a liquid phase and a solid phase. The liquid phase generally gets blown out of the engine with the exhaust and, therefore, can do no harm to an engine. But if enough solid material is also produced, and rapidly enough, some of that material will accumulate on the cylinder walls where, in just a few minutes, it can severely damage piston rings and valves and even cause an engine to simply self-destruct and stop (piston seizure). The amount of solids produced by Diesel engines increases dramatically just above a fuel/air ratio of 0.055. For this reason, manufacturers as a rule equip the fuel injection pumps with stops so that the engines can only operate below 0.055, or even 0.050.

⁸⁷ Cf. the experiment by R. E. Pattle *et al.*, *op. cit.* (note 84).

⁸⁸ It is interesting to note that some people cite this data as proof that it is possible to attain high CO-levels with Diesel engines: cf. Martin Pägert, (<https://web.archive.org/web/19991105065216/http://www.ei-kon.e-technik.tu-muenchen.de/~rwulf/leuchter/leucht19.html>). What is not mentioned, however, is that this is possible only with special, gaseous fuels, not with Diesel fuel.

Operating any Diesel engine near the maximum load recommended, regardless of the particular design or engine type, would have produced significant amounts of smoke. Smoke is generally also noticeable immediately after start-up, even at idle or under light load, when the engine has not yet had time to reach its normal operating temperature.

Pattle *et al.* found that an engine running at less than half load and producing 0.22%/vol. CO also produces extremely pungent, tear-inducing smoke which, if piped into a gas chamber, would reduce visibility to a mere foot or so.⁸⁴

It should surprise no one that there is no mention of smoke from the Diesel – black, white, dense or otherwise – anywhere in the Gerstein statement or in any of the post-war trial testimony. Can one really believe Jews locked in gas chambers would have patiently withstood such torture?

Chart 7: Liquids and solids exhausted from engine per hr, and measured smoke.⁸⁹ The heavy vertical line marking a fuel/air ratio of 0.055 (air/fuel ratio 18:1) has been added by the author.

7.6. Noise, Vibration, Stench

The stench of Diesel exhaust is familiar to anyone who has ever driven a car behind a truck or bus anywhere in the world. That stench is, in effect, a powerful ‘warning ingredient’ to the presence of a Diesel engine – at least until the late 1990s when the addition of catalytic converters and other equipment reduced the stench substantially. Ironically, it was the removal of a warning ingredient in Zyklon B in 1944 which some Holocaust believers have on occasion cited as ‘proof’ of a fiendish National-Socialist desire to deceive intended victims. With Diesel exhaust, a technology to remove its warning ingredient simply did not exist until many years later – and yet, the National Socialists still supposedly used Diesels for mass murder instead of, for example, gasoline engines which have no such warning ingredient. In other words, the arguments about ‘warning ingredients’ in connection with the ‘Holocaust’ are at least as nonsensical as everything else.

But in addition to smoke and smell, Diesel engines are notorious also for their intense noise and vibration. One might even say that the noise and vibration are additional ‘warning ingredients.’ Because of their higher compression ratios, lower rpm’s, and the explosive type of combustion, the amount of vibration that Diesels produce is substantially greater than that of any comparably sized gasoline engine. The noise and vibration are among the major reasons why Diesels have not generally been used in automobiles. They are just too noisy for many people to bear.

If the 550 hp, V-12 cylinder Diesel from a typical Soviet T-34 tank had been mounted on the floor of a small building and run for half an hour at more than $\frac{3}{4}$ of full load (at more than 400 hp), the noise and vibration would have been at least as noteworthy and as wildly spectacular as the wailing of any Jews – and yet, there is no mention of any such noise or vibration in the Gerstein Statement, or in any of the post-war trial testimony.

7.7. Diesels for Underground Mining – a Brief History

Since tests with lethal emissions on humans are not possible, accidental human deaths have always been an invaluable, alternative source of information for toxicologists. Parts of underground mines can become totally enclosed – just like gas chambers – due to inevitable accidents, especially roof failures, which often occur there. Gasoline engines have generally been outlawed for underground applications because of their notorious, toxic exhaust, but the history of Diesels underground is quite different.

⁸⁹ M. A. Elliott, R. F. Davis, *op. cit.* (note 60), p. 345.

Diesel engines were first used underground in coal mines in 1928 in Germany, in the Saar region, and quite safely so, from all this author has seen in the excellent German literature on this subject, especially in the German mining journal *Glückauf*.⁹⁰ In Britain, Diesels were first used underground in Yorkshire in 1939, more than ten years later, but in the following decades, thousands more were used throughout Britain.

For the mining industry, where heavy machinery is used in the most difficult and unnatural circumstances imaginable, and where the industrial accident rate has always been among the highest anywhere, one might expect many fatal accidents. The British safety record with Diesels, however, was a stunning surprise to many mining professionals, especially in the USA, where Diesels were not permitted for underground coal mines until the 1970s. The British safety record was spelled out in June of 1974 when S. Gilbert of the British National Coal Board wrote the following in a major British mining journal about their experience going back 35 years to 1939:⁹¹

“Although it is accepted that there are potential hazards arising from the emission of noxious gases in the exhaust gases of Diesel engines, the degree to which these are controlled in British coal mines has proved to be very effective. An examination of ALL safety records has revealed that no person has suffered any harmful effects either temporarily or permanently as a direct result of breathing any toxic gas emitted from any vehicle powered by a Diesel engine.”

Another quote from the technical literature summarizes much of what can be found there in general. The following is from an American essay by Dennis S. Lachtman, Director for Health Engineering for the EIMCO Mining Machinery company in a section subtitled: “NO significant human hazard seen in over 20 studies.”⁹²

“A number of studies evaluating human response to exposure of Diesel have included experience among Diesel bus workers, Diesel railroad workers, and metal and non-metal miners working with Diesel production equipment and underground. There are more than 20 human health studies involving working populations exposed to Diesel exhaust emissions. As can be seen from a careful review of these studies, NO SIGNIFICANT health hazards have been associated with exposures to Diesel exhaust emissions. More recently, the National Institute for Occupational Safety and Health (NIOSH) has reported on epidemiological studies it has performed in underground mines. One of these studies included an MSHA^[93] and NIOSH joint study of the relationship between the underground environments in 22 metal and non-metal mines looking at the health of more than 5000 miners. This comprehensive study focuses on the health effects of both silica dust and other substances including those found in Diesel exhaust. [...] The researchers reported that the data showed an ABSENCE of harmful effects from Diesel exhaust.”

There was not even one injury from Diesel exhaust. No doubt, there must be some occasional deaths somewhere in the world, but they are certainly few and far between (see Subchapter 7.9. on this). This does not prove that Diesels cannot be used to commit mass murder, but it is all the more reason to believe that murder with Diesel exhaust is far from easy. The only evidence of Diesels having ever been used anywhere, anytime for murder in all of human history is within the ‘Holocaust’ claims, and there the best evidence by far are Gerstein’s confessions.

The fact that the general non-toxicity of Diesel exhaust was rather well known in the pre-WW2 German mining industry and the fact that Kurt Gerstein had been trained as a mine surveyor with, no doubt, some practical experience in German mines suggest that his obviously concocted ‘confessions’ near the end of the war may have been deliberately constructed around Diesel exhaust so that, what would seem at first glance to be a highly in-

⁹⁰ H.H. Müller-Neuglück, H. Werkmeister, “Grubensicherheit der Diesellokomotiven,” *Glückauf*, 23 (Aug. 23, 1930), p. 1145.

⁹³ Mine Safety & Health Administration.

criminating eyewitness account, would eventually, long after the war, be recognized as worthless.⁹⁴

Every year, thousands of deaths occur worldwide due to carbon-monoxide poisoning from gasoline engines. Suicides in cars from gasoline engine exhaust are common also, and are well documented in public health reports. The most common deaths from carbon monoxide occur, however, when people simply park their vehicles and run their car or truck engines to keep warm in winter – or cool in summer – by means of an automotive air conditioner. Approximately one thousand accidental deaths still occur in this way every year in the US alone, even though American cars are routinely equipped today with catalytic converters and emission controls. But there are basically no known deaths in cars or trucks with Diesel engines!

Every night across the world, tens of thousands of truck drivers sleep in their truck cabs with the Diesel engines running throughout the night – to keep warm in winter or cool in summer. Although there are on occasion some exhaust leaks into the van compartment of a truck, there is no evidence of even one trucker dying, or being injured, in such circumstances. It never happens. There are no known Diesel suicides either. Diesel exhaust is inherently safe.

7.8. Confirmed Deaths from Diesel Exhaust?

Of course, there is always a fly in the ointment. In our case, as far as is currently known, there were in fact two cases where death due to Diesel exhaust were reported, one a suicide, the other a truck driver. But looking at both cases more closely merely serves to confirm our conclusions.

The case first concerns an 83-year-old geriatric suffering from a heart disease, who managed to kill himself with the exhaust gases of his diesel car.⁹⁵ But the victim died not as a result of carbon-monoxide poisoning. Instead, he had inhaled a lot of soot over an extended period of time, which clogged up his lungs so that finally his heart failed. It is not known how long that suicide took, but since the motor was running on idle, and because a thick layer of soot had covered the inside of the car, it may well have taken hours. This is an extraordinary case, because the author knows of no other case of a poisoning with subsequent death caused by a diesel engine. Hence, rather than refuting the conclusions of this contribution, it merely confirms how difficult it is to kill with Diesel-exhaust gas. Had the person been a young, healthy person, he probably wouldn't have died at all.

The other case is more complicated and concerns a truck driver who was found dead in his truck's cabin after spending the night in it with the engine running.⁹⁶ The coroner's report stated that the driver died of a mixture of heart disease and carbon-monoxide poisoning, so it was assumed that exhaust gas with lethal amounts of carbon monoxide had accidentally entered the driver's cab during the night. During an ensuing litigation, the defendant – the manufacturer of the truck, Freightliner – lost the case and had to pay compensation to the victim's widow. Does this prove that Diesel-exhaust gases kill? Let's look at the case's details:

1. Even though “the diesel truck has been examined,” and “no evidence of a defect, leak, or repair was found,” this argument was dismissed by the court, as blood samples of the victim had shown that he had died of carbon-monoxide poisoning.⁹⁷

⁹⁴ Other obvious falsehoods within his ‘statement’ may have been intended to serve the same purpose. He may have simply wanted a cover story to save himself without providing any long-term comfort to Germany's enemies. His own role in the SS with the application of Zyklon B, albeit for life-saving work, would have given him additional reason to be fearful about his own future.

⁹⁷ U.S. Court of Appeals. 11th Circuit, No. 04-13762, *Nelson v. Freightliner*, Sept. 29, 2005, p. 14; www.ca11.uscourts.gov/unpub/ops/200413762.pdf.

2. Since diesel-exhaust gases are smelly and irritating even when the engine is idling, let alone at higher engine loads, it is difficult to see why the victim wouldn't have noticed that exhaust gas was entering his cabin. This is all the more so as the flu-like symptoms the trucker had complained about for days are said to have been symptoms of a mild carbon-monoxide poisoning.⁹⁸ If that carbon monoxide really came from engine exhaust, it would have filled the cabin with smoke and stench. Any driver noticing this would have seen to it that he gets fresh air from outside, and that his truck be checked.
3. The victim was found "lying in the fetal position, face down between the seats of the truck."⁹⁹ Freightliner trucks have bunks for truckers to sleep in. If the man really went to sleep in his truck for the night, then he would have used the bunk for this. No trucker lies down to sleep between the seats of his truck with his face down. This indicates that the trucker must have suddenly succumbed due to heart problems, which is also what the coroner had concluded initially after finding that one of the victim's coronary arteries was almost completely clogged. The coroner added carbon-monoxide poisoning to the cause of death only after having received the test results from the lab.¹⁰⁰
4. Because idling diesel engines produce only minute amounts of CO – even if the fuel pump is maladjusted – it is not at all clear how this could have led to the observed high carbon-monoxide levels found in the trucker's blood. The court admitted into evidence the exhaust characteristics of a *similar* diesel engine whose exhaust gas – under unspecified conditions (!) – contained lethal amounts of carbon monoxide, but refused to have the actual engine tested.¹⁰¹ Exhaust characteristics usually cover the entire range from idle to heavy load, and there can be no argument that diesel engines *can* kill when running with a heavy load. It is not clear from the court record, however, whether the tested engine was producing lethal amounts of CO when idling, which seems most unlikely.
5. The analytical method used to determine the amount of carbon monoxide in the man's blood was challenged as highly inaccurate when applied to severely decomposed samples, as was the case under investigation,¹⁰² but the court dismissed that argument as well. A scientific paper supports the claim of unreliability by showing that, with the criticized method and in decomposed blood samples, carbon-monoxide readings can be up to 50% higher than the actual levels.¹⁰³ The lab that performed the victim's blood test disputed this, but ignored the scientific paper proving them wrong.¹⁰⁴ It was only in 2010 that a team of scientists developed an analytical method that could determine a carbon-monoxide poisoning reliably and accurately also in severely decomposed corpses.¹⁰⁵

Hence, we ultimately don't know what the man died of, but here as well, a severe heart condition was at least a contributing factor, if not the main cause of death. The paper reporting about the case did confirm, however that "an extensive literature review produced no scientifically reported case of fatal CO poisoning attributed to diesel fuel exhaust" and that "lethal CO poisoning from inhalation of diesel fumes from any make or model of on-road vehicles is virtually unheard of and contemporary medical literature does not report it."¹⁰⁶

In other words, unless all the Jews locked up in a Diesel gas chamber suffered from severe heart disease, there was no chance of killing them all within half an hour of Diesel-fume exposure.

7.9. An Expert Opinion from Israel

A major engineering textbook from 1998, which should contain just about everything one needs to know about Diesel emissions, is titled: *Handbook of Air Pollution from Internal Combustion Engines* with the subtitle *Pollutant Formation and Control*. The book is co-authored by a dozen of the world's leading experts on automotive emissions. It should be an excellent source of information on precisely how one might kill people with Diesel exhaust. But in the entire 550-page book, which is rather typical of all other books one can find on this subject, there was only one sentence relevant to our subject:¹⁰⁷

“Although carbon monoxide (CO) emissions are regulated, they will not be considered here, as the Diesel engine combustion process by definition inhibits the production of CO.”

In other words, the toxic effects from carbon monoxide in Diesel exhaust, including long-term effects, were just not worth bothering with as a pollutant of any kind. What is ironic is that the editor is an Israeli professor of engineering in the Department of Mechanical Engineering at Ben-Gurion University. His name is Eran Sher. Someone should reach out to him and ask if he really believes the National Socialists murdered people with Diesel exhaust, and whether he had ever considered testifying as an expert in the trial of John Demjanjuk.¹⁰⁸ On whose side would he have testified?

Surely, if Eran Sher and the Israelis really believe it happened in National-Socialist Germany, then it might happen again. Surely, we should be concerned that Arab leaders may use their tens of thousands of Diesel trucks to perpetrate another ‘Holocaust.’ Surely, the United Nations arms inspectors who are searching for weapons of mass destruction in the Middle East will miss the boat if they fail to investigate Arab Diesels.

8. Diesel Gas Chamber Operation

8.1. Imposing an Engine Load

To impose a substantial load on any engine is far from easy. For example, if one has an ordinary truck, a full load can be imposed on the engine by first filling the truck with a heavy cargo and then racing the vehicle up a steep hill with the fuel pedal to the floor. Under that condition, one would probably be putting out about 0.4%/vol. CO, which is indeed lethal in the long run, from the exhaust pipe of an undivided chamber Diesel. However, if the truck is simply parked in a driveway, it is practically impossible to impose any significant load on the engine. Merely ‘racing’ the engine with the transmission in neutral will impose no more than a few percent of load. Letting the clutch slip and stepping on the accelerator may impose a somewhat greater load on the engine – but the clutch will rapidly burn out. Jacking up the rear end of the vehicle and applying the brakes while racing the engine will impose a somewhat greater load, but the brake linings will rapidly burn out.¹⁰⁹

The only way to realistically impose a significant load on any engine is by coupling to the engine some kind of brake dynamometer or other load, such as a generator with an electrical load, a fan, pump, or the like.

¹⁰⁷ Eran Sher (ed.), *Handbook of Air Pollution from Internal Combustion Engines: Pollution Formation and Control*, Academic Press, Boston 1998, p. 288.

¹⁰⁸ See for this Arnulf Neumaier, “The Treblinka Holocaust,” this volume; cf. also Yoram Sheftel, *The Demjanjuk Affair: The Rise and Fall of the Show Trial*, Victor Gollancz, London 1994.

¹⁰⁹ When testing the emissions of Diesel engines, German engineers sometimes impose load on the engine without coupling any equipment by simply opposing the inertia of the engine. Accelerating an engine with the fuel pedal depressed and with no load increases the engine speed rapidly and the fuel/air ratio as well, but only for a few seconds. This may suffice to measure the engine's exhaust composition at high fuel/air ratios, but if the cylinder wall temperatures are still unusually low, this may give erroneous test result.

Brake dynamometers were available, but, although the Germans must have had many in engineering testing laboratories, they were not readily available. They are not the kind of equipment that one finds in auto-repair shops even today. They cost far more than the engines to which they are attached, since they are not mass-produced – at least not at that time.

An electric generator arrangement seems possible, since Treblinka and Belzec would have needed electricity, even if only to keep the barbed wire charged and the lights burning, and also because in those days the rural areas of these camps in eastern Poland may not have been connected to a public power grid. However, such an arrangement suggests a continuous operation of both the generator and the Diesel engine, which is contrary to Gerstein's statement. According to that statement, the engine had to be started just for the gassing. There is nothing in the statement to even remotely suggest that the engine served any other purpose than to kill Jews. If it had had a dual purpose, for example to also drive an electric generator, one would expect some comment about the lights going on as the gassings began, but there is nothing of the sort. In fact, according to the Gerstein statement, Pfannenstiel had "his eyes glued to the window in the wooden door" *before* the Diesel even started which strongly suggests that the "electric light which illuminated the interior of the room" must have been on before any gassing even started. In other words, there must have been electricity from a power source other than the alleged Diesel gassing engine.

Postwar 'eyewitnesses' for Treblinka-related trials actually claimed that the same building where the 'gassing Diesel' was housed also contained a second engine which operated independently of the first and which supplied electrical power to the camp.¹¹⁰ In other words, these accounts specifically show this generator *not* to be related to those engines that allegedly produced poison gas, just as accounts of the poison gas engines never suggest any other, continuous use of those engines. On the contrary: accounts describing events as the engine was supposedly being started are amazingly similar. The command given to the engine operator to start the engine – "Ivan, water!" (Treblinka) – or similar events for Belzec ("Heckenholt Foundation") appear not just in the Gerstein Statement, but run like a central theme throughout the eyewitness literature.

From the files of the Auschwitz camp authorities, we know that the SS provided this camp with emergency power equipment consisting of German Diesel engines rated at 350 hp at 500 rpm.¹¹¹ Witnesses stated explicitly that the power facilities were constantly running under some load in Treblinka due to the lack of a connection to a public network, and that these engines operated *in addition to* the gassing engines which operated only sporadically. Something is obviously wrong with these 'eyewitness' stories. Anyone with any expertise would have used the exhaust of the engine driving the generator which was already operating under load, instead of an additional engine for gassing purposes without any load. Besides, the exhaust gases from the engine driving the generator were already there and available (where else would the exhaust gases go except into the sky). It is ridiculous to claim that another Diesel engine with or without some specially-arranged load was started on top of this.

8.2. An Inhalation Study on Living Animals – Combining all Possible Effects

Arguably, our analysis of the combined effects of CO and reduced oxygen has been highly theoretical until now – and yet, it has still not included possible combinations of effects with

¹¹⁰ E. Fuchs, in E. Kogon *et al.* (eds.), *op. cit.* (note 25), p. 163: "... In dem dortigen Vernichtungslager habe ich eine Lichtmaschine aufgestellt, damit die Baracken elektrisch beleuchtet werden konnten."/p. 116: "I installed a generator in this camp to provide electric lighting for the barracks."; Jacob Apenszlak (ed.), *The Black Book of Polish Jewry*, Roy Publishers, New York 1943, pp. 142ff.: murder by means of steam, Diesel engines for supplying power. Cf. also A. Donat (ed.), *The Death Camp Treblinka*, Holocaust Library, New York 1979, p. 157, as well as the verdict of the Düsseldorf District Court in the Treblinka Trial, Ref. 8 I Ks 2/64, p. 300; Y. Arad, *op. cit.* (note 21), p. 42.

¹¹¹ "Kostenveranschlagung über Notstromanlage in K.L. Au.," of the Grabarz Company, Gleiwitz, of Nov. 10, 1940; RGVA, 502-1-128, pp. 45-49; another document from early 1943 mentions an emergency power generator for the Auschwitz Main Camp and two for the Birkenau Camp: "Geschäftsverteilungssplan der Zentralbauleitung der Waffen-SS und Polizei Auschwitz und der unterstellten Bauleitungen"; RGVA, 502-1-57, pp. 312-317.

all other ingredients in Diesel exhaust. A theoretical analysis of all such combinations of effects is beyond the scope of the present paper. Happily, there is a detailed study of the actual effects of full-strength Diesel exhaust on living animals. It appeared in the *British Journal of Industrial Medicine* in 1957.⁸⁴ To my knowledge, this is the only study of this type ever undertaken and is the most important single piece of evidence for the analysis of Diesel toxicity anywhere.

Eight experiments were performed with undiluted exhaust from a small Diesel engine¹¹² under four different operating conditions – two essentially identical experiments for each operating condition. Each experiment was performed on four rabbits, ten guinea-pigs, and forty mice. The animals were only introduced into the chamber after the Diesel-exhaust concentrations had had approximately half-an-hour to stabilize and purge the chamber of all other air.

In the two tests under “low” load (Condition A: no external load, only accessories such as the cooling fan), which was essentially an “idle” condition, there were no fatalities among any of the test animals even after five hours of continuous exposure. But even under Conditions B and C where the engine was under heavy load (with “a large fan and two hydraulic pumps to provide the load”), the survival rate was as follows:

1. All rabbits survived the five-hour exposure and even continued to live for a week thereafter.
2. Of the guinea-pigs, only one died during the actual five-hour exposure period, although most died over the next seven days.
3. Of the mice, only a minority died during the five-hour exposure and most even survived through the following week.

Under Condition D, which was by far the most extreme test with a severely restricted air intake,¹¹³ a maximum CO level of 0.22%/vol. was produced with an oxygen concentration of 11.4%/vol. Although many, but not all, of the mice died within an hour, all of the rabbits and guinea-pigs survived for more than one hour of continuous exposure.¹¹⁴ In fact, the last animal died only after three hours and twenty minutes.

For exposures only as long as Gerstein alleged (32 minutes), the survival rates would have certainly been even better. In other words, on the basis of tests on living animals with full-strength Diesel exhaust, Gerstein’s gas chamber would have been a complete fiasco.

Add to this the fact that the results gained from experiments done with small mammals such as mice, rabbits and guinea pigs cannot be transferred to humans without adjustments. A U.S. study on the effect of gaseous hydrogen cyanide on various mammals has shown that the sensitivity decreases with the size of the mammal, not because the poison is less toxic to them, but because breathing and heart rates decrease with the size of an animal, slowing down the speed with which toxic gaseous compounds are absorbed into the bloodstream.¹¹⁵ Although the study was done with a different poison, the reason for this effect was not due to the kind of poison but strictly due to physiological features of the mammals tested, hence

¹¹² Engine size certainly determines the total amounts of pollutants, toxic or otherwise that an engine will produce, but it has no bearing on the concentrations of those pollutants in the exhaust. It is the concentrations which are the critical consideration and not the total amounts of pollutants once levels have stabilized inside the gas chamber. A large engine will fill a potential gas chamber quicker than a small engine, but that is all. Concentrations within the chamber will never exceed the levels measured directly in the engine’s exhaust.

¹¹³ Diesel engines have never used carburetors (all gasoline engines did until recently), and hence no idle-mixture adjustment screws which were always part of the carburetors and allowed fuel/air ratios to be easily maladjusted. For this reason, Pattle *et al.* (note 84) went to the round-about-method of ‘choking’ rather than purchasing a suitable brake dynamometer, which suggests just how difficult it was to get such devices even in a postwar environment. The choking employed was extreme: the air intake was restricted to less than 2½% of its normal size, which caused engine misfiring during warm-up.

¹¹⁴ R. E. Pattle *et al.* made two experiments with that setting, one resulting in only 0.12% CO, the other in 0.22% CO; no reason was given; CO₂ was between 2.34% and 3.58%; *op. cit.* (note 84), pp. 49f. For another discussion of the same material see: Conrad Grieb, “Holocaust: Dieselmotorabgase töten langsam,” *VffG*, 1(3) (1997), pp. 134-137.

¹¹⁵ B.P. McNamara, *The Toxicity of Hydrocyanic Acid Vapors in Man*, Edgewood Arsenal Technical Report EB-TR-76023, Department of the Army, Headquarters, Edgewood Arsenal, Aberdeen Proving Ground, Maryland, August 1976; www.dtic.mil/cgi-bin/GetTRDoc?AD=ADA028501.

this should also apply to carbon monoxide. In fact, if we look at the results, we can see that the smallest mammals – mice – succumbed faster and in greater numbers to the exhaust gases than the larger ones (guinea pigs and rabbits). In other words: since it takes hours to kill all small-size mammals with a severely choked Diesel engine, it would have taken even longer when using the same technique on humans.

We can get a rough idea about the time it takes to kill a healthy, strong person with exhaust gases from a choked diesel engine without load – the only realistic scenario for the alleged extermination camps – from another study, which also involved an unusual suicide – but this time with a gasoline engine.

In this case, a 36-year-old healthy man committed suicide while taping the sounds he was making. The tape was later found and analyzed. From the breathing sounds he made, it turned out that the man had died some 20 minutes after he had turned on his car's engine. The scientists involved replicated this scenario by recording the carbon-monoxide content inside the car in a separate experiment; see Chart 8.¹¹⁶ The increase of the carbon-monoxide content inside the car was only about to level off when the victim died, but it is safe to say that the exhaust gasses themselves must have had at least 5%/vol. of carbon monoxide. Since the engine was idling, the oxygen content of the exhaust gas must have been minimal, probably only around a percent or two.¹¹⁷ If we assume an oxygen content of 2%/vol., hence only some 10% of the normal oxygen content in the atmosphere, this results in an *effective* CO concentration of around 50%/vol.! This proves that even with high carbon-monoxide concentrations, healthy people don't die fast. A choked diesel engine without load could have produced, at worst, 5 to 10% of the actual carbon-monoxide concentration of the above-mentioned suicide engine, and far less if comparing the effective CO concentrations (50% as opposed to not even 1%).

Hence, if we extrapolate these suicide data, it would take at least ten times as long as this suicide, or longer (if comparing the effective CO concentrations), in order to kill all healthy people in a gas chamber using the exhaust gas produced by a choked Diesel engine, meaning 200 minutes or more. This corroborates the results of the above-summarized experiments with animals, plus my hypothesis that even these data are "optimistic," considering that mice and rabbits succumb faster than humans.

8.3. Actual Concentrations of Poison Gas in a Gas Chamber

When the exhaust from a Diesel engine enters a gas chamber, the carbon monoxide concentration will initially be extremely low and the oxygen level will be high. (Since the doors of the chamber had to be opened so that the dead victims from a previous batch could be removed and the new victims could enter the room, enough fresh air would have entered the chamber.) As more and more Diesel exhaust fills the gas chamber, the carbon monoxide concentration will gradually rise to the same level as one finds directly inside the exhaust pipe of the Diesel engine – without ever exceeding that level (similar to Chart 8, but with much lower values).

Chart 8: Carbon-monoxide concentration in a gasoline car during a replicated suicide lasting 20 minutes.

¹¹⁶ N.G. Flanagan, D.G. Wootton, D.K. Goff, "An unusual case of carbon monoxide poisoning," *Medicine, Science, and the Law*, 18(2) (April 1978), pp. 117-119.

¹¹⁷ I am relying here on the oxygen contents in gasoline-engine exhaust as reported by E. Keeser *et al.*, *op. cit.* (note 64), pp. 4, 26; modern engines have an even more-efficient consumption rate of oxygen, and catalytic converters use up some of the oxygen left in the exhaust gases in order to oxidize incompletely burned components of the exhaust gases, so it is safe to say that modern gasoline engines don't have more oxygen in their exhaust gases either.

It is impossible to determine from the Gerstein Statement how long it would have taken before the CO concentration in the gas chamber equaled that in the exhaust, because Gerstein does not provide nearly enough information about the engine or alleged gas chamber in Belzec.

The situation is somewhat better with regard to the Treblinka Camp. The ‘eyewitness’ statements collected and published about the claimed Treblinka gas chambers are somewhat more detailed, but still contradictory. It is generally alleged that the larger and more important of the two gas-chamber buildings in Treblinka consisted of 10 chambers, five on each side of a corridor.¹¹⁸ Each chamber measured 8 m in length, 4 m in width, and 2 m in height, totaling 320 m² in area and 640 m³ in volume. The chambers were allegedly filled with the exhaust from only one Russian Diesel tank engine, which could have been only the 550 hp V12 engine of a T34 tank with a displacement of 38.86 liters.¹¹⁹ The total claimed area of 320 m² could not have held more than 3,200 persons at one time.¹²⁰ Given an average body volume of 60 l (this takes into account the presence of children), these people would have taken up a space of 192 m³, leaving about 448 m³ air volume.

The Russian Diesel tank engines of those days had a maximum speed of 2,000 rpm.¹²¹ Since a four-stroke engine discharges the contents of its cylinders only every second revolution, an engine running at 2,000 rpm blows an exhaust volume of one thousand times its cubic capacity into the chamber per minute, *i.e.*, 38.86 m³. Therefore, after a little more than eleven minutes, enough exhaust would have been discharged to replace the entire air volume of the gas chambers only once.

The eyewitnesses claim that the gas chambers were sealed hermetically; in other words, they were air-tight.¹²² But this is impossible, since there must have been some openings for the excess gas to escape.¹²³ Also, without many holes and cracks, everyone in that chamber would have already died of lack of oxygen during the “2 hours and 49 minutes” by Gerstein’s stopwatch. However, since, during the gassing, some of the Diesel exhaust would have also escaped through these holes or cracks – not just normal air from within the chamber – and since the intended victims would have also consumed some of the carbon monoxide with their breathing, a minimum of two complete air exchanges of the room volume seem entirely reasonable for filling the chamber entirely with the exhaust. At 2,000 rpm, therefore, one cannot expect the CO content to have reached the level of the exhaust itself in less than 22 minutes from the start of the gassing procedure (which is similar to the graph in Chart 8). If a restricted air intake to the engine had produced a 0.22%/vol. CO content in the exhaust in the worst case possible, the average CO concentration would have then approximated 0.11%.¹²³ The full 0.22%/vol. CO would have been available for no more than the last ten minutes of the gassing, which took 32 minutes at most. The 22 minutes with a CO level of 0.11%/vol. and the additional 10 minutes at 0.22%/vol. CO result in an effective average for thirty-two minutes of only 0.14%/vol. CO (simply on the basis of mathematical averaging). At an oxygen content of ca. 11.4%/vol., this amounts to an effective CO content of 0.27%/vol., which is not enough to kill all humans within half an hour. In other words, it is well below the 0.4%/vol. of CO that we had identified in Chapter 5 of this article as the *minimum* needed.

¹¹⁸ For a detailed analysis of the gas chamber claims for Treblinka, see C. Mattogno, J. Graf, *op. cit.* (note 63), pp. 111-121, also in particular the Soviet ‘gas chamber’ plans on pp. 344f.

¹¹⁹ Cf. A. Donat (ed.), *op. cit.* (note 110), pp. 34, 157ff., and the Treblinka verdict of Düsseldorf, *ibid.*, pp. 300ff.; Y. Arad, *op. cit.* (note 21), pp. 119f.; J.-F. Steiner, *Treblinka*, Stalling, Oldenburg 1966, p. 173. Regarding the engine type, cf. Subchapter 4.3. and note 57.

¹²⁰ J.-F. Steiner, *op. cit.* (note 119), p. 173, speaks of 200 people per chamber. J. Wiernik (in A. Donat, *op. cit.* (note 110), p. 161), on the other hand, fantasizes about 1,000 to 1,200 per chamber, whose area he gives as 7 × 7 m, in other words more than 20 people per square meter. Y. Arad, *op. cit.* (note 21), pp. 120f., puts a maximum of 380 but an actual estimate of up to 300 people into each chamber, and at times speaks of only 6 chambers, not 10.

¹²¹ Augustin, *Motortechnische Zeitschrift* 5(4/5) (1943), pp. 130-139.

¹²² The resultant excess pressure would have exploded the chamber after only a few minutes; cf. the chapter by A. Neumaier in this volume.

¹²³ Assuming a linear increase in the CO content.

In the animal experiment previously described with a real CO concentration of 0.22%/vol., *which was already established in the gas chamber before the test animals were even introduced* and which, because of the reduced oxygen content of 11.4%/vol., corresponded to an effective CO concentration of $(0.22 \times 21 \div 11.4 =) 0.4\%/vol.$, it still took more than three hours to kill *all* of the test animals. It is, therefore, perfectly reasonable and even quite conservative to say that in a similar gassing attempt with humans and with only a gradually increasing CO concentration, the majority of people in the alleged gas chamber would still be alive after one or even two hours. Such a result would have been an utter fiasco.

8.4. Exhaust Gas Recirculation for Mass Murder

The remaining question is whether a Diesel gas chamber might have worked by recirculating the exhaust gas from the engine. This is actually a well-known problem with Diesel exhaust going back to at least the 1920s in Germany. The concept is to have the air intake, as well as exhaust, connected directly to the same gas chamber. The exhaust then goes around through the engine and the gas chamber, and on back through the engine, and around again, and again. Eventually, so much oxygen is consumed and so much carbon monoxide is produced, that together these changes kill everyone. But the engine eventually also shuts itself down when there is no longer enough oxygen to sustain combustion; at that point, the engine also ceases producing any more carbon monoxide. The problem is that, in order to receive an exhaust gas with a relatively high content of CO, a Diesel engine has to be suffocated to a degree right from the start.

Carbon monoxide gas is an excellent fuel and actually burns far more easily than Diesel fuel or even gasoline. As the exhaust gas recirculates, any additive increase in carbon monoxide levels which one might at first expect will, in fact, not occur at all so long as there is still sufficient oxygen to allow the CO to burn in the cylinders. If the CO level is initially only 0.05% after the first pass through the engine, one might – wrongly – expect it to double to 0.10% after the second pass, and then rise to 0.15% after the third pass, and so on, and on. In reality, however, the carbon monoxide concentration is not at all accumulative so long as the air/fuel ratio remains above 15:1. Since the initial air/fuel ratio is probably more than 100:1, there will be no significant change in CO concentration until several complete exchanges of gas have occurred, and just shortly before the engine shuts down. This is confirmed by results in a US Bureau of Mines study which also shows that the CO levels remain low until just shortly before the engine shuts down.¹²⁴

Whether the engine dies before all the intended victims die is the important question. In order to obtain 0.22%/vol. of CO in the experiment conducted by Pattle *et al.*, the engine's air intake had to be so severely restricted that it did misfire during warm-up.¹¹³ This means that choking the engine even more by reducing the oxygen concentration from 21%/vol. of normal air down to 11.4%/vol. of recirculated exhaust gases would have shut down the engine most likely well before all victims had died. There is no mention in the Gerstein statement or anywhere else of the engine shutting down. The only reference to engine problems is that Mr. Heckenholt allegedly needed more than two hours just to get the engine *started*, during which time the survival of the victims would have required many air leaks into the gas chamber. It seems about as reasonable as anything else to conclude from the Gerstein statement that the engine ran throughout the 32-minute gassing period without any problem from lack of oxygen, or for any other reason. In other words, even the recirculation argument fails to fit any of the Diesel gas chamber scenarios from Gerstein, or anyone else.

8.5. The Most Likely Diesel Arrangement for Mass Murder

Without a thorough understanding of the basic characteristics of Diesel engines, the method that would have come to mind most readily to a simple-minded wannabe mass murderer would have been to simply park a Diesel truck or a T-34 tank outside the gas chamber building and pipe the exhaust into the gas chamber without any load on the engine. Such an arrangement would have annoyed the hell out of any group of intended victims, but would

¹²⁴ W.F. Marshall, R.W. Hurn, "Hazard from Engines Rebreathing Exhaust in Confined Space," *Report of Investigations 7757*, U.S. Department of the Interior, Bureau of Mines, 1973, pp. 7-10.

have

Illustration 1: A typical gas wagon which had originally been a conventional bus but which was subsequently retro-fitted with a gas-generator and a Saurer engine.¹²⁵

given them nothing worse than a headache, if that. The headache would have been due to the stench, smoke and noise, but certainly not due to carbon monoxide and/or lack of oxygen. As a method for mass murder, it would have been a fiasco.

For any Diesel arrangement to have been even marginally effective for mass murder, it would have required an exceptionally well-informed team of individuals to know and do all that was necessary. They would have had to be familiar with the carbon-monoxide and oxygen-emission curves for their particular engine. Such information outside of the usual environmental-protection data is probably not known even today to most engineers. The Diesel-gas-chamber designers would also have had to know either 1) how to impose and maintain an engine load of more than $\frac{3}{4}$ of full load on their engine, since anything less would just not have been enough, or 2) how to combine a restricted air intake with some lesser degree of engine loading to achieve the same effect. If they had overloaded the engine or had operated it for too long at or near full load (more than 80% of full load is generally considered unsafe for continuous operation), they might have had to overhaul or even perhaps replace the engine after each gassing because of fouling and damage from engine smoke. Merely to gather and assemble the appropriate equipment, including the equipment for imposing and controlling an artificial load, would have been a major undertaking which would have required the expertise of experienced engineers, not just ordinary auto mechanics. If the engine (550 hp!) had been mounted on the floor of the building, it would have required a proper foundation with some provision to isolate vibrations so as to avoid tearing the building apart.

The all-important question is: if any persons had been smart enough and resourceful enough to know and do all that was necessary to make a workable Diesel gas chamber, why would they have bothered with a Diesel engine in the first place? For all their efforts, they would have had an average effective concentration of less than 0.4%/vol. carbon monoxide and more than 4%/vol. oxygen, resulting in execution times of probably more than two hours. Any common, ordinary gasoline engine without any special attachments would easily have given them ten times more carbon monoxide at idle as any comparably sized Diesel at full load. Any common, ordinary gasoline engine would easily have given them 7%/vol. carbon monoxide and less than 1%/vol. oxygen. If one had fiddled with the carburetor, one could have had as much as 12%/vol. carbon monoxide by merely turning one small screw, namely the idle-mixture adjustment screw. Comparing the two types of engines with both operating at idle or under light load, the difference is even more dramatic. At idle or under light load, any common, ordinary gasoline engine without any special attachments would

Illustration 2: Saurer BT 4500 with producer gas generator.¹²⁸ A Saurer truck similar to this type allegedly was used for mass murder – not with producer gas, but incredibly with its exhaust gas.¹²⁹

Illustration 3: Austro-Fiat 4 D 90 A, producer gas generator as standard fitting.¹²⁸

easily have given more than one hundred times as much carbon monoxide as any comparably sized Diesel.

The hoax becomes even more obvious when one discovers that far better sources of carbon monoxide, better even than gasoline engines, were readily available to the Germans – and required neither Diesel fuel nor gasoline.

9. Half a Million Poison Gas Generators on Wheels – Never Used for Mass Murder!

During World War Two, most European countries relied for most of their non-military automotive transport upon vehicles which used neither gasoline nor Diesel, but burned solid fuels such as wood, coke or coal instead. The solid fuel, which was generally wood, was first converted into a mixture of combustible gases by burning it incompletely in a generator, usually mounted at the rear of the vehicle. The gases were then withdrawn from the generator by engine suction through a pipe beneath the vehicle, and then burned in a modified gasoline or Diesel engine located at the front of the vehicle. The combustible gas produced in this way always contained between 18%/vol. and 35%/vol. carbon monoxide. The exhaust of engines operated with this producer gas never contained more than 0.3%/vol. CO, since nearly all of the CO was consumed in the engine.¹²⁶

In German-speaking parts of Europe, these vehicles were called *Generatorgaswagen*, or simply *Gaswagen*. If they burned wood, which most of them did, they were also called *Holzgaswagen* which translates literally as “woodgaswagons.” In English-speaking countries, these vehicles were generally called “producer-gas vehicles.” However, they could just as appropriately have been called “poison-gas vehicles,” because that is precisely what they were. The operation of these vehicles required special safety procedures as well as special government-approved training and licensing of the *many hundreds of thousands of drivers who drove these vehicles daily throughout German-occupied Europe*.¹²⁷

Every driver of a producer gas vehicle was required to know and comply with the following guidelines and to keep them at hand in the vehicle:¹³⁰

“Safety Guidelines for Producer Gas Vehicles

dated November 28, 1942

*The gas from the gas generator contains up to 35% carbon monoxide (CO). Carbon monoxide can be fatal at concentrations as low as 0.1% when inhaled. For this reason – especially while starting the fire or during refilling – there is a **danger of poisoning!***

¹²⁶ H. Bour, I. McA. Ledingham, *Carbon Monoxide Poisoning*, Elsevier, Amsterdam 1967, p. 2.

¹²⁷ The German technical automotive literature of that time is chock full of material about this technology that has been so completely forgotten today. For an introductory overview, cf. *Automobiltechnische Zeitschrift* 18 (1940) and 19 (1941). Cf. also E. Eckermann, *Alte Technik mit Zukunft: Die Entwicklung des Imbert-Generators*, Oldenbourg, Munich 1986.

¹²⁸ Walter J. Spielberger, *Kraftfahrzeuge und Panzer des österreichischen Heeres 1896 bis heute*, Motorbuch Verlag, Stuttgart 1976, pp. 207, 213.

¹²⁹ Cf. the contribution by I. Weckert, this volume.

¹³⁰ H. Fiebelkorn, *Behandlung und Instandsetzung von Fahrzeug-Gaserzeugeranlagen*, W. Knapp, Halle 1944, p. 189; cf. the 2nd edition, *ibid.*, 1948.

Start and refill the gas generator only out-of-doors! Do not linger unnecessarily near the blower discharge. Do not let engines run in garages.

Responsibilities of the supervisor and driver:

All persons who work with producer gas generators are required to learn and conform to the necessary procedures for a safe and orderly operation. The manufacturer's operating instructions must be strictly followed and kept available within the vehicle. Furthermore, these safety guidelines must also be kept with the vehicle documents for each producer gas vehicle [...]" (emphasis as in original)

Already the first two sentences of these "safety guidelines" tell every driver the two most important facts they should know if they wish to commit mass murder. Producer gas is poison gas! All producer-gas vehicles were, in effect, self-propelled poison-gas generators. The fuel itself was poison gas.

Wherever possible, liquid fuels had to be reserved for the military, at least for the duration of the war. But also for the eventual peace, one would need this poison-gas technology. The interest which even Adolf Hitler showed is demonstrated by his remarks at an exhibition of Mercedes-Benz heavy trucks with Mercedes-Benz gas producers that burned coal:¹³¹

"Vehicles of this kind will retain their special significance after the war as well; for given the trend towards increasing motorization, we will never have a surplus of liquid fuel and will always be dependent on imports. The additional domestic fuels thus benefit our own national economy."

By the autumn of 1941, some 150,000 producer gas vehicles were already in use in Germany and the areas controlled by her. The conversion of existing trucks to producer gas resulted in a monthly savings of about 45 million liters of liquid fuel. The goal was "to free every bit of dispensable fuel for the *Wehrmacht*."¹³² By the end of the war, more than 500,000 producer gas vehicles had been put into service by the Germans.¹²⁷

On May 30, 1942, *Reichsmarschall* Göring established a "Generator Central Office" for his Four-Year Plan:¹³³

"to boost generator production, to determine new types on the basis of the fuel situation at hand, to develop new solid fuels for use in the generator, and to develop suitable processes for preparation and low-temperature carbonization etc."

Göring stated:¹³⁴

"I refer to the explanations in my aforementioned decree, regarding the urgency of making Germany as well as the occupied territories and dependent lands largely independent of liquid fuel as quickly as possible, and would ask you to vigorously support the efforts of the Central Office through the increased use of generators."

As the war continued, conversion to solid fuel became more and more urgent. On September 22, 1942, Reich Minister Speer, acting in his capacity as plenipotentiary for armament production (GBRüst), ordered the conversion of all medium and heavy vehicles including buses

Göring to the Reich Economic Minister, the Reich Transportation Minister, the Commanders-in-Chief of the Wehrmacht units, the Chief of the Wehrmacht Supreme Command, the Reich Ministers for Armament and Munition as well as for the occupied eastern territories, according to E. Hafer, *op. cit.* (note 133), p. 17.

in all German-occupied regions.¹³⁵ A year later, the GBRüst's amendment of September 13, 1943, eliminated all exemptions. Now the conversion of all civilian vehicles was mandatory as well, including even the smallest automobiles.¹³⁶ After the war, in a long report about German oil production, the U.S. Strategic Bombing Survey stated that even some of the best German tanks, 50 *Königstiger*, had been driven with producer gas just before the war's end.¹³⁷

The vast numbers of producer gas vehicles as well as the fervor with which the Germans developed new vehicles and uses for this gas technology, which is so evident throughout their wartime automotive literature, undermine the Holocaust story in general. If the Germans had ever intended to commit mass murder with carbon monoxide, they certainly would have had enough brains to employ this superb poison-gas technology long before using anything as idiotic as Diesel exhaust. And it would have worked!

Eichmann and the other 'transportation experts' involved in the "final solution of the Jewish question," which was indeed primarily a transportation problem, would certainly have been fully aware of these vehicles. If they had

had any expertise at all, they would have also been aware of some of the unique features of these vehicles. For example, each generator had a startup blower which was powered by either a small electric motor or by hand. It would have been childishly easy to attach a hose or pipe to the exhaust of that blower so as to force poison gas into any cellar, barracks or prison, but nowhere in the vast Holocaust literature is any such technology even suggested.

Another irony is the fact that the same producer-gas technology was actually used to gas rats and other vermin. According to the public-health literature from the Third Reich, producer-gas equipment from the firm of Nocht-Giemsas for killing rats was "very common."¹³⁹ And yet, no one thought of using this obvious, practical, effective, simple and cheap technology on humans – even Jews who had sometimes been compared to rats as in the film *Der Ewige Jude* (*The Eternal Jew*). Obviously, the National Socialists were not nearly as fiendishly clever as exterminationists often claimed they were, in connecting Jews to rats.

10. Vans with Diesels for Mass Murder?

10.1. The Vans of Chelmno

The producer-gas vehicles are not the same as the "gas vans" allegedly used for mass murder in Chelmno and by the *Einsatzgruppen* in Russia, despite the ironic circumstance that the words used in German for both kinds of vehicles are similar. According to all the 'evidence,' the murderous "gas vans" were ordinary heavy vehicles whose exhaust (most often from a

Diesel operating at idle) became the lethal gas. The gas-van story is based primarily on a strange Nuremberg trial document known as PS-501, which is a probable fabrication based upon an unavailable, innocuous letter from SS-Untersturmführer Becker to SS-Obersturmbannführer Walther Rauff, in which Becker requested all-wheel-drive vehicles so that he could more easily travel the muddy Russian roads. The letter suggests modifications to an S-vehicle.¹⁴⁰ The text of an unavailable original seems to have been rewritten with several changes to give it an incriminating significance. This ‘document’ and others are critically assessed in the present volume by Ingrid Weckert.

The least important of the six supposed extermination camps, in terms of numbers of victims, is Chelmno. Oddly enough, it is the orthodox Chelmno narrative that seems to have some persistence even among Holocaust skeptics.¹⁴¹ The ‘evidence’ is especially vague and consists essentially of anecdotes, many describing events long after September 13, 1943, when all use of liquid fuels (gasoline or Diesel fuel) for non-military vehicles was strictly prohibited, and when producer gas was required as the only alternative fuel. The anecdotes invariably allege that the driver, just prior to departure with a batch of entrapped victims, would work on something or other (always totally undefined as to what and how) beneath the vehicle to redirect the exhaust from the engine (Diesel or gasoline – take your pick) into the van compartment to kill the victims. For producer-gas vehicles, a lengthy startup procedure (half-an-hour seems to have been common) involving many adjustments to the gas generator and piping below the vehicle was, indeed, always necessary, but this was not the case for vehicles using liquid fuels. More than likely, some ‘witnesses’ had actually seen a producer-gas startup procedure and then, after the war, embellished that true experience to make something atrocious.

What argues most strongly against all such gas-van stories is that the use of any kind of liquid fuel in medium and heavy trucks had already been prohibited a year earlier by Speer on September 22, 1942; smaller vehicles were still exempt until a year later (see Chapter 9).

Illustration 6: German war-time producer-gas generator made by Kromag.

¹⁴⁰ “S” stood for “standard” as in standard drive via the rear wheels, as opposed to the “A” vehicles with all-wheel drive, and the special or “Sonder” vehicles abbreviated as “Sd.-Kfz”; all vehicles such as tanks, for example, had their own *Sonder* class numbers. Another *spezial* class was designated with a lower case “s.” cf. W. Spielberger, *Spezial-Panzer-Fahrzeuge des deutschen Heeres*, Motorbuch-Verlag, Stuttgart 1977, pp. 153f.; W. Spielberger, *Die Halbkettenfahrzeuge des deutschen Heeres*, 2nd ed., *ibid.*, 1984, pp. 170f.; W.J.K. Davies, *German Army Handbook 1939-1945*, Arco, New York 1981, p. 90. In other words, the German designations had nothing whatever to do with any sinister cover-up as Hilberg and others have often alleged.

¹⁴¹ For a thorough revisionist critique of orthodox claims about Chelmno see C. Mattogno, *Chelmno: A German Camp in History and Propaganda*, 2nd ed., Castle Hill Publishers, Uckfield 2017.

Illustration 7: Design of an Ostmark producer gas generator.¹⁴³

Assuming that anyone would have broken the law for a few percent of CO from gasoline engine exhaust – or even only a fraction of a percent from Diesel engine exhaust – when the legally required fuel was far more lethal, is too ridiculous. It never happened!

10.2. Origins of the Diesel Story

As far as I could find out, the Diesel-murder claims originated in mid-1943 Soviet propaganda. A short time earlier, in April 1943, the German discovery of the massacre of thousands of Polish officers at Katyn had exposed the Soviets as ruthless mass murderers. The Germans had openly invited internationally-renowned forensic scientists, even from enemy countries, to thoroughly examine the victims.¹⁴²

To avenge themselves on the Germans for the debacle of Katyn, the Soviets staged show trials a few months later in Kharkov and Krasnodar. In the course of those trials, some unfortunate German prisoners provided ‘confessions.’ However, the Soviets denied any and all non-Soviet experts access to the alleged sites of the massacres. During the trials, the Soviets accused the Germans of having driven civilians into the countryside in Diesel trucks. After the trucks containing the victims were parked, the Diesel-engine exhaust was allegedly redirected into the interior, and the victims expired shortly thereafter.

In this scenario, the Diesel engines would have been operating without any load and at fast idle at the very worst. The CO concentrations under such conditions would hardly have caused a headache in half an hour.

Here are some excerpts from reports about those trials as published by the Soviets. In July 1943, *Pravda* reported on the show trials of a number of German prisoners who had suppos-

¹⁴² Auswärtiges Amt (ed.), *Amtliches Material zum Massenmord von Katyn*, F. Eher, Berlin 1943; cf. George Sanford, *Katyn and the Soviet Massacre of 1940*, Routledge, Oxford 2005.

¹⁴³ *Automobiltechnische Zeitschrift*, 18(4) (September 1940), p. 458

edly murdered Soviet citizens in Krasnodar with Diesel-powered vans. English translations of the *Pravda* stories appeared in the book *The Trial*, where we have the following text:¹⁴⁴

“In the autumn of 1942, the Germans began to use specially equipped automobiles which the population called ‘murder vans,’ for the purpose of doing away with Soviet citizens. These ‘murder vans’ were covered five-ton or seven-ton gray-painted motor trucks, driven by Diesel engines.”

From the report of a trial staged at Kharkov in December of 1943, we have the following claim:¹⁴⁵

“The vans are lined inside with galvanized iron and have airtight folding doors at the back. The floor is equipped with a wooden grating under which passes a pipe with apertures. The pipe is connected to the exhaust pipe of the engine. The exhaust gases of the Diesel engine, containing highly concentrated carbon monoxide, enter the body of the van, causing rapid poisoning and asphyxiation of the people locked up in the van.”

The simple fact is that Diesel exhaust never contains “highly concentrated carbon monoxide.” But that didn’t stop the Soviets from producing even forensic “evidence” of these alleged Diesel-gas murders:¹⁴⁶

“Of the vast number of bodies found in these places, 623 [exhumed corpses] were examined by medical experts. [...]

On the basis of the thorough medical, chemical and spectroscopic investigation which was carried out, a Committee of Experts consisting of Dr. V. I. Prolorovsky [...] arrived at the conclusion that the cause of death in 523 of the cases examined was carbon monoxide poisoning. [...] In their report the Committee of Experts stated that the carbon monoxide could undoubtedly have had lethal effect if the waste gases from the Diesel engine penetrated the closed van.

The Commission stated:

‘If the outlet for the carbon monoxide (including waste gases) is in closed premises, the concentration of carbon monoxide in those premises increases very rapidly and may cause death even in the course of a few minutes (from five to ten).’

[...] The total number of the Soviet citizens asphyxiated in ‘murder vans’ is 7,000.”

As discussed in Subchapter 7.8., however, reliably detecting carbon monoxide in severely decomposed corpses is impossible even with today’s refined forensic methods. Hence, it would have been impossible for these Soviet experts to prove carbon-monoxide poisonings in corpses which had been rotting in their graves for many months, if not more than a year. How decomposed the corpses allegedly examined by the Soviet actually were can be gleaned from a photo added to one of the reports.¹⁴⁷

In a later publication from December 1943 titled “Soviet War Documents” and published by the Soviet Embassy in Washington, DC, we have a description of the gas van on page 172.¹⁴⁸ According to that description, the engine was a “Sauer” engine. There was no “Sauer” engine manufacturer, but there was the famous company called “Saurer.” And in fact, the Holocaust orthodoxy insists that some of these claimed “gas vans” were manufactured by the firm of Saurer.¹⁴⁹ The ironic part of this tale is that, even before the war, Saurer was arguably the manufacturer of the world’s best and most efficient Diesel engines and producer-gas trucks. During the war, this Swiss-Austrian firm continued its technical lead-

¹⁴⁸ Republished as Soviet Union (ed.), *Soviet War Documents: June, 1941– November, 1943*, University Press of the Pacific, Honolulu 2003.

ership over Mercedes, Opel and Ford who were actually manufacturing far more producer-gas vehicles.¹⁴⁹ More than 6,000 Saurer trucks were built in Vienna during the war, and most, if not all, had producer-gas generators *and Diesel engines*. How absurd to believe anyone with even a minimum of technical understanding would even try to use the exhaust from these trucks for murder, when the fuel itself was a thousand times more lethal!

The connection that was made by the Soviets to a company called “Sau[r]er” is significant because it reappears in the infamous fake letter from Becker to Rauff in Nuremberg File PS-501.¹⁵⁰ By their common errors one can recognize the work of the forgers.

There was never any mention during those trials of the engines having been gasoline engines – although that would have certainly made sense technically – nor is there any mention of producer-gas wagons which would have made all the sense in the world.

As Ingrid Weckert has demonstrated in her contribution to the present book, “gas vans” were actually a Soviet invention prior to World War Two, used by the NKVD to kill undesirable opponents of the communist regime (see her Subchapter 2.1.). However, these Soviet vans did not have Diesel engines, because all pre-war trucks in the Soviet Union had only gasoline engines, since the entire transportation system in the USSR was based on earlier, western engine types such as that of Ford Motor Co. Therefore, more than likely, the Soviet allegations of gas trucks are truly based on the Soviets’ own mass-murder technology to which they simply added Diesel engines to make them seem more sinister and, most of all, more German.

The gas van story is an adaptation – by Holocaust propagandists – of some documental materials relating to the perfectly innocent use of producer-gas vehicles, and supported, of course, by appropriate ‘eyewitness’ testimony. It is within the gas-van story, however, that one can see in miniature the process by which the Holocaust story in general has been confabulated.

10.3. Accidental Gassings from Producer Gas Vehicles

Producer gas is poison gas – extremely poisonous with CO concentrations as high as 35%. Although there is no credible evidence of any deliberate gassings with producer-gas vans, there were no doubt many fatal, accidental gassings. These arose almost inevitably from the nature of the half million producer gas vans which made and used their own CO in order to propel the vehicles. Fatal accidents were inevitable from the earliest uses of these vehicles and, no doubt, became more frequent as the war made it more difficult to properly train drivers. However, this author has found no actual record of any such accidents in the German wartime literature. The severe dangers of accidental poisonings and explosions are, however, clearly spelled out in the German literature including the above-mentioned safety guidelines.

It is in the post-war literature of Scandinavia that one can, however, find the most-startling detailed information as to the many medical problems arising from producer gas vehicles. Poisonings from producer gas were so common in Sweden, for example, that two special clinics were established to treat the victims.¹⁵¹ When the war ended, the use of these vehicles declined only gradually. In the early 1950s in West Germany, at least 20,000 were still in use, and their safe operation was still of great concern to medical professionals.¹⁵²

¹⁴⁹ All Saurer Diesel engines employed, even before the war, a swirl chamber (*Doppelwirbelkammer*) machined into the top of each piston. This design had been unused for many years after the war and after the demise of the Swiss Saurer. However, the concept has been revived as “bowl in piston” by Audi and is now used widely in the most advanced Diesel engines of VW and Mercedes Benz to help meet the most stringent environmental emissions standards; see John B. Heywood, *Internal Combustion Engine Fundamentals*, McGraw-Hill, New York 1988. Of all the Diesels available, the advanced Saurer designs were the least likely to could have served as any kind of source for toxic emissions.

11. An Empire Built on Coal, Air, and Water

In addition to producer gas, the Germans had the world's most advanced coal-gasification technology.¹⁵³ One of the first steps was to produce carbon monoxide, which could then in turn be used either as fuel or as an intermediate raw material in the synthesis of other products. The following postwar statement by some of America's greatest experts on German industry summarized the situation:¹⁵⁴

"Wartime Germany was a chemical empire built on coal, air, and water. Eighty-four and a half per cent of her aviation fuel, 85 per cent of her motor gasoline, all but a fraction of 1 per cent of her rubber, 100 per cent of the concentrated nitric acid, basic component of all military explosives, and 99 per cent of her equally important methanol were synthesized from these three fundamental raw materials.

[...] The body of this industrial organism was the gas-generating plants which turned coal into process gases; its arms were the many plants that used those gases and other materials drawn from the coal to produce synthetic fuels and lubricants, chemicals, rubber, and explosive products."

Because of Germany's isolation from adequate sources of petroleum and natural rubber, she had already converted much of her industry during World War One to use coal as a substitute source of hydrocarbons for making synthetic liquid fuels as well as a vast assortment of chemical substances, including synthetic rubber. Millions of tons of carbon monoxide were produced as part of this technology, and would have been more than enough to kill the entire population of Europe many times over.

Coal-gasification plants were located in all of Germany's industrial regions. One region containing several such plants was Silesia, where the abundance of coal had for more than a century been the basis of that region's industry. One Silesian facility was the IG Farbenindustrie A.G. plant at Auschwitz, a small portion of whose carbon monoxide could easily have been diverted through a small pipeline to Auschwitz-Birkenau only a few miles away. But no one alleges that carbon monoxide was ever used for mass murder at Auschwitz, although that would have been an ideal place for it. For mass murder at Auschwitz, the Germans supposedly used a completely different substance: Zyklon B.¹⁵⁵

12. Jumping Ship

The first reaction to earlier versions of the present paper and similar revisionist writings based on it⁵ was to defend the Diesel narrative at all costs, even at the risk of looking like fools!¹⁵⁶ However, the only way of effectively dealing with the revisionist challenge was to either agree, or to ditch the Diesel narrative for good.

A full-fledged attempt at abandoning the Diesel engines finally occurred in 2011, after revisionist arguments on the non-suitability of Diesel engines for mass murder had made some inroads: A German anthology published in 2011 projected to give an update on the 1983/1993 publication *Nazi Mass Murder* by Kogon and colleagues,²⁵ contains the paper of German toxicologist Achim Trunk on the toxic gases allegedly used for this “Nazi Mass Murder.” In reaction to revisionist arguments that Diesel-exhaust gases are unsuitable for mass murder, this expert first agreed with most of what I have established here:¹⁵⁷

“It can be derived from exhaust gas analyses and animal experiments [by Pattle et al.] that it is possible in principle to murder human beings with Diesel exhaust gases – even many simultaneously [although it would take hours]. In order to generate highly toxic exhaust gases which kill within a maximum of 20 minutes, however, Diesel engines in the facilities for gas murder would have had to be operated under heavy load, i.e., they had to be slowed down somehow. Such a slowing, power-consuming device (such as a dynamometer) was much less simple and cheap to obtain than the large engine from a destroyed vehicle wreck. Slowing down a powerful Diesel inside a gas murder facility would have meant moreover that the engine would have become much noisier and would have vibrated much more intensively. Its exhaust gases would have contained a lot of soot. Whether such features have been observed (or whether clues to power consuming devices exist) is no longer a question to toxicology but rather to the sources and source criticism. According to this author’s knowledge, no clues in that direction exist.”

Achim Trunk is misleading his readers here. As we have seen in Subchapter 8.2. from the suicide with gasoline-engine exhaust, even with a carbon-monoxide content in the exhaust gas of 5%/vol. and extremely little oxygen, it still took 20 minutes to kill. As we can see from Table 4 in Subchapter 7.2., a Diesel engine at full load cannot produce more than 0.4%/vol. of carbon-monoxide content, and more oxygen to boot. Hence, using a gas containing only 8% of the CO concentration that was needed during the reported 20-minutes suicide – plus more oxygen – simply wouldn’t have done the job.

The important fact here is, however, that Trunk agrees in principle that Diesel engines simply wouldn’t have done the deed. So how did he bail out of that tight spot.? Simply by denying the existence of Diesel engines in those camps:¹⁵⁸

“This argument is irrelevant, as serious research does not believe at all that diesel engines were generally used at the ‘Aktion Reinhardt’ extermination camps.”

A while later he adds:¹⁵⁹

“The fact that gasoline engines were indeed employed in the ‘Aktion Reinhardt’ extermination camp is substantiated by reliable sources. Rudolf Reder for instance, one of the very rare survivors of the Belżec extermination camps, speaks of a gasoline engine standing in a small room near the gas chambers.”

Just how “reliable” Reder is, we have seen in Subchapter 4.1.

Hence, after almost 70 years of uninterrupted orthodox Diesel historiography, they suddenly jumped ship, with no place to go.

¹⁵⁶ For instance Josef Bailer, see note 6. The same goes for Martin Pägert, note 88.

Illustration 10: New Russian Word admits frankly: The revisionists have the “air superiority”; Diesel exhaust is unsuitable for mass murder! Here the issue of February 28, 1995: “Ideology Holocaust.”

13. Conclusion

Although it would have been theoretically possible to commit the deeds alleged for Treblinka, Belzec and by some also for Sobibor with Diesel engines, it would have required an inordinate amount of expertise and determination as well as technical apparatus to impose or simulate sufficient load on the Diesel engines – which is not even remotely indicated by the eyewitness testimony or by any other evidence – or profound knowledge on how to professionally constrict the engines’ air supply. Even if all the necessary conditions had been met, the would-be murderers ultimately would have had merely an arrangement which at best (or worst?) would still have been only marginally effective at its morbid, several-hours-lasting task. It would be hard to imagine a mass-murder method more awkward and more inefficient. Even if some deranged minds had tried for a time to commit murder with Diesel exhaust, after a few, many hours lasting attempts it would have become apparent to even the most demented fiend that something far better was needed. The idea that the National Socialists actually used such a method not just for a few fiendish experiments, but continually over many months in several different locations is too preposterous. It never happened!

If the National Socialists had ever intended to commit mass murder with CO, they doubtlessly would have used the ubiquitous producer-gas technology. 500,000 producer gas vehicles are the incontrovertible evidence that the Diesel claim is totally absurd.

According to *Novoy Russkoy Slovo* (*New Russian Word*),¹⁶⁰ a New York daily newspaper edited by and for emigrated Russian Jews, Prof. Raul Hilberg, at that time the world’s most renowned Holocaust historian, made the following statement:

“The Nazis did not manufacture soap from human fat, and did not kill their victims with Diesel exhaust. All these rumors were circulated in 1942, but we have the duty to thoroughly separate these rumors and fabrications from the facts and truth. Little lies provide fodder for the deniers and act against us.”

Well, in the “definitive edition” of his *opus magnum*, he still insisted that Diesel engines were used (at least in Belzec and Treblinka; see Subchapter 4.1.). So, what else about the orthodox Holocaust narrative will be thrown overboard in the future that used to be “definitive”?

The absence of credible evidence for the orthodox Holocaust narrative will continue to drive revisionism long after the current crop of revisionists has gone. Ultimately, the purveyors of the National-Socialist homicidal-gassing claims condemn themselves. The German officials who suppress, even with imprisonment, the least expression of doubt about the gassing claims condemn themselves as well.

The Treblinka Holocaust

ARNULF NEUMAIER

*“Achieving our quest of a ‘new world order’
depends on our learning the Holocaust’s lessons.”*

Ian J. Kagedan¹

1. Introduction

1.1. Is There a Holocaust Religion?

Legislation and jurisdiction prohibit citizens in the Federal Republic of Germany under threat of punishment to deny the Holocaust – the “burnt offering of the Jews”. On the other hand, the term Holocaust Religion has not yet found any legal assessment.

It is permissible today to deny that the Jew Jesus, who was crucified in the land of the Jews, was the Son of God, although his alleged divine existence has been the foundation of a world religion for nearly 2,000 years. Until not too long ago that denial and doubt about the divinity Jesus was punished with death. The founder of the religion Jesus and his mother Mary, both from the tribe of David, ascended to heaven without leaving any tangible traces of this for posterity, and according to the Holocaust Religion, six million Jews were burned as a burnt offering that didn’t leave a trace on earth, and the smoke ascended upwards as well.

An essential characteristic of religions is the unprovability and irrationality of their dogmas, as well as the merciless will to annihilate those who adhere to another faith or are perceived as enemies of the faith. This behavior is understandable, considering that this is about the credibility of the carriers of the faith, and thus about their supremacy and power.

When the Roman Catholic power cartel recognized the threat to the foundations of its faith by the scientifically based heliocentric worldview, the Holy Inquisition took action with its instruments of terror and violence. Since the heliocentric worldview could not be refuted, the revisionists of the geocentric, that is to say the false, worldview had to be destroyed. The methods are the same today.

Thus, every religious belief requires two preconditions: first, the power of the heralds of the untruth, or at least of what are unproven or unprovable assertions, and then the inertia of the masses, for whom the word by philosopher Friedrich Nietzsche applies:²

“Belief means not wanting to know what is true.”

Another hallmark of religions is the rapidly increasing number of miraculous events as time progresses. And yet, the truth founded on science has prevailed and has caused the decline of the powers founded on faith. It will always be like that.

In what a fortunate position the German citizens are today is revealed by the fact that, according to a ruling of the Munich County Court in May 1993, Judge F. Schenk granted a defendant the right to doubt the Holocaust; that is permissible – in contrast to the denial of the mass killing of Jews.³ The elaborations presented here are meant neither to doubt nor to

Arnulf Neumaier died in 2000. Two years after his death, Carlo Mattogno and Jürgen Graf published a thorough study of the Treblinka Camp with numerous documents which were unknown to Neumaier; the book is currently available in its fourth English edition: *Treblinka: Extermination Camp or Transit Camp?*, 4th ed., Castle Hill Publisher, Uckfield 2016. Some of the more important new findings of Mattogno and Graf were included in this revised edition of Neumaier’s contribution. Editor’s note.

deny the Treblinka Holocaust, but merely to convey facts and related considerations. Everything else results from this by way of logic.⁴

2. The Demjanjuk Trial and Treblinka

2.1. Background of the Demjanjuk Trial

In the days of the Soviet Union, the American immigrants from Ukraine were split into two factions, one of which was favorably disposed towards Moscow. At that time, this group published a weekly paper titled *News from Ukraine*. Michael Hanusiak, one of the participants in this publishing venture, made no bones about his close ties to Soviet authorities in Moscow. H. P. Rullmann believes that one of the foremost tasks of this group was the defamation of the anti-Communist, nationalist Ukrainians in exile by way of charging them with having collaborated with the 'German Fascists' during the Second World War.⁵ This approach had already been practiced in other cases, which resulted in the creation of internal strife not only amongst these Ukrainians-in-exile but also tainted their collective public reputation.⁶ This Soviet method of combating opponents by means of disinformation and falsified or completely fabricated evidence is well-known. In the mid-1980s, even the German Federal Department of the Interior issued a warning regarding this practice.⁷ It is all the more astonishing that the American authorities were taken in by the Communist Ukrainians-in-exile in the case of Demjanjuk in the mid-1970s.

In 1975, after alleged in-depth research in Soviet archives, Michael Hanusiak submitted to the US Department of Immigration and Naturalization in New York a list with 70 names of presumed National-Socialist collaborators of Ukrainian origin; this list also included the name of John Demjanjuk, who until 1981 was an American citizen living in Cleveland, Ohio, where he worked as an auto mechanic. In the case of Demjanjuk, Hanusiak came up with an incriminating statement by a certain H. Danilchenko, according to whom Demjanjuk had served in the Sobibor and Flossenbürg camps.⁸ This, along with a picture of an ID card allegedly documenting Demjanjuk's employment in these two camps, prompted the American Immigration and Naturalization Office to take up the case of John Demjanjuk.⁹ The role which pro-Communist Hanusiak played in building up Demjanjuk to be seen as Ivan the Terrible can hardly be misinterpreted. The true instigators of what was in effect a new Eichmann Trial are not difficult to discern behind the scenes. After the periodical *News from Ukraine* urged the American authorities in 1976 to take steps against Demjanjuk, the American Department of Justice requested that Demjanjuk be stripped of his citizenship due to false claims made in his immigration papers. Meanwhile, witnesses were found in Israel who claimed to have recognized John Demjanjuk on photographs as having been Ivan the Terrible of Treblinka. Investigations regarding Sobibor as well as Treblinka followed. In 1979, the case was officially taken over by the OSI (Office of Special Investigations), the American 'Nazi-hunting' office set up under President Carter.

However, the Trawniki ID card No. 1393, issued to the name Demjanjuk, which had been reprinted in *News from Ukraine* and later became the only piece of documental evidence used in the trial, exists in two variations: the second card numbered 1393 and bearing the name Demenjuk is part of the documentation on the Flossenbürg Concentration Camp, which is held in the German Federal Archives in Koblenz. Similar names are very common

⁴ That disclaimer didn't stop the German judiciary to prosecute Herr Neumaier for "Holocaust denial," but before his case could end with a final verdict on appeal, he escaped his detractors by ascending to the heavens – maybe.

in the Ukraine. But timewise, the number does not correspond to Demjanjuk's stay in Trawniki. – Furthermore, ID numbers were only used once.

The 'original ID card' was not available for the pre-trial investigations in Jerusalem. This central piece of evidence could evidently not be procured from the Soviet Union through official channels, for which reason Armand Hammer, the American billionaire of Jewish extraction, was called in. Hammer had already enjoyed an extremely good business relationship with Soviet circles in Lenin's time.¹⁰ In any case, the Trawniki ID card did not get to Jerusalem through official channels, but personally via Armand Hammer. If the ID card had been officially released, appropriate documents on this would exist both in Moscow and in Israel – but they don't.

In the meantime, Dieter Lehner, the expert from the Demjanjuk defense team, has exposed the Trawniki ID card as a total fabrication,¹¹ a discovery matching those of the German Federal Bureau of Criminal Investigations (*Bundeskriminalamt*, BKA). Even though the Israeli authorities were already apprised of this fact by the BKA as early as 1987, the court suppressed this information. Chief Prosecutor Michael Shaddek commented merely:

"As far as I am concerned Demjanjuk did commit murders – whether in Treblinka, in Sobibor or elsewhere, that's secondary."

And in response to the objection that the BKA had proven the SS ID card to be fake:¹²

"We are relying on our own expert reports and consider them no less convincing than before."

But German authorities also played a strange game where the forged Trawniki ID card was concerned. For example, the *Münchener Merkur* reported that the German Federal Chancellery itself saw to it that Demjanjuk's defense team did not learn of the German expert reports by Lehner and the BKA, and that the latter was ordered from higher-up to keep silent about its findings. And what is more: the expert witness from the BKA who did ultimately take the stand in the Jerusalem Court after all, had been instructed by the German authorities to draw up only a partial report for this trial, dealing exclusively with certain similarities between the retouched ID card photo and John Demjanjuk's real-life features. In this way, the impression was evoked during the Jerusalem Trial that the ID card was genuine. The partial report was read into the Jerusalem record by BKA expert Dr. Altmann. BKA Department Chief Dr. Werner described these actions of the German authorities in a memo he drew up at that time as follows:¹³

"Clearly, factual doubts had to be subordinate to the political considerations."

It has turned out that the photograph on the ID card is an old photo of Demjanjuk from 1947 which was taken from his American immigration file(!) and retouched for the ID card.

When the first doubts were raised about the authenticity of the heretofore unknown ID card, the Jerusalem Court suddenly had more specimens of the same kind on hand for three other Ukrainians; the origin of these cards, which were also fabrications, has not been determined.¹¹

The supposition that the KGB might have officially fabricated the ID card is put in doubt by the poor quality of the fabrication and by the ignorance, shown by the card, of the administrative structure of the German police branch that was responsible for issuing this kind of ID card during the war, as expert Lehner was able to demonstrate convincingly.¹¹ This does not, however, rule out that a certain circle within the KGB contributed to the fabrication of the card, a circle which must also have had connections to the American immigration authorities, where the photo originated. These circles are in all probability identical to those who worked from the start to set up Demjanjuk as Ivan the Terrible in order to revitalize the Holocaust Religion.

¹³ For details cf. A. Melzer, "Iwan der Schreckliche oder John Demjanjuk, Justizirrtum? Justizskandal!," *SemitTimes*, spec. ed., Dreieich, March 1992, esp. pp. 3, 13; also *Münchener Merkur*, March 26, 1992. I am grateful to D. Lehner for further information, cf. *op. cit.* (note 11).

The proceedings to expatriate Demjanjuk began in 1981 before the Cleveland District Court. Naturally, five survivors of Treblinka “recognized” Demjanjuk as Ivan the Terrible, and the copies of the Trawniki ID card No. 1393 submitted to the court became the chief piece of evidence on whose basis Judge Battisti stripped Demjanjuk of his U.S. citizenship.¹⁴

On the request of Israel, deportation proceedings began in 1984, and the deportation itself followed in February 1986, in violation of all traditions of international law, as the alleged site of the crime (Treblinka) was located in Poland, and at a time when the state of Israel did not even exist yet. How very important this Trawniki ID card was to the OSI in this trial is demonstrated by the fact that the OSI, together with Israeli authorities, attempted to persuade a number of witnesses to confirm the authenticity of this fabricated card against their better knowledge.¹⁵

2.2. The Demjanjuk Trial in Jerusalem

With the start of the Demjanjuk Trial in Jerusalem on February 16, 1987, the Treblinka Holocaust was restored to the active memory of the world public. According to the testimony of Jewish witnesses, Treblinka had been a World War Two extermination camp where vast numbers of Jews were killed – between 700,000 and 3 million, depending on the source consulted.¹⁶ The Jerusalem Court decided to set the number of victims at 875,000.¹⁷

The intended linchpin in this revival of the Treblinka Holocaust was the Ukrainian John Demjanjuk. This man was declared to be “Ivan the Terrible” of Treblinka where he was said to have committed every means of killing, cruelties and perversions imaginable. Not enough that he allegedly drove the Jews into the gas chambers personally, armed with iron canes and a sword, and cut off women’s breasts with the bayonet – no, he also operated the Diesel engine whose exhaust gas was piped into the gas chambers in order to kill the Jews. The fact that these claims contradicted the sole alleged documental proof, which indicated that Demjanjuk had been employed in the camps Sobibor and Flossenbürg (and only in those camps) – this fact was generously overlooked.

The chief witness for the prosecution in the Jerusalem Trial, Eliahu Rosenberg, had stated in Vienna on December 24, 1947, in a “fact report” whose twelve pages he had each signed personally, that the Ukrainian Ivan had been clubbed to death in his sleep.¹⁸ When Demjanjuk’s defense attorney Dov Eitan pointed out to Rosenberg during the Jerusalem Trial that John Demjanjuk, present there in the courtroom, could not be Ivan the Terrible, since according to his – Rosenberg’s – own testimony Ivan was already dead since 1943, Rosenberg said that this had been a misunderstanding on the part of the clerk recording his testimony at the time, or that he had had only third-hand knowledge of the death of Ivan the Terrible. The clerk in question, T. Friedman, refused to testify on this issue, since Jewish sources had threatened him with death in the event that he were to confirm that Rosenberg had really reported the death of Ivan the Terrible as his own personal experience at the time in question.¹⁹ Clearly, therefore, Rosenberg had really affirmed Ivan’s death under oath.

So, had Ivan the Terrible been resurrected?

It is characteristic of the psyche and the mental state of this kind of witness to justify alleged mistakes with the wish for a certain reality; the truth is subordinated to intentions and wishes. Regarding the motives prompting the State of Israel to hold this trial, Jewish publisher A. Melzer wrote that in the mid-1980s the collective Israeli awareness of the Holocaust was on the wane. It had become little more than one chapter among many. Further, the view taken of the Jews by the world public at that time was becoming increasingly

shaped by the actions of the Israelis towards the Palestinians, which began to be likened to those of Himmler's SS. This was probably the reason why the proceedings in the Jerusalem District Court dealt less with the case of John Demjanjuk than, essentially, with the total destruction of the Jews in Europe. The 'Auschwitz Cudgel' was in need of exercising.²⁰

Ever since the mid-1970s, Ivan the Terrible, personified by John Demjanjuk, was systematically built up to be a symbol of the Treblinka Holocaust. The circumstance that the Monster of Treblinka had to be a Ukrainian probably has historical roots in the time when the Cossacks liberated the western part of the Ukraine from Jewish oppressors and tax-collectors.²¹ Oaths of vengeance of the Old-Testament type and instinctive hatred survive for centuries.

Many of the witnesses who testified in Jerusalem against Demjanjuk contradicted not only themselves or at least their earlier statements, but also usually recounted utterly incredible, even downright grotesquely unrealistic scenarios. That the testimonies at the base of this trial were extremely questionable was also noted by Dr. Elisabeth Loftus, a Jewish-American expert on eyewitness testimony who attended several sessions of the trial as a spectator and later wrote a book about it.²² Loftus had previously all but proven the unreliable nature of witness testimony in general in hundreds of trials.²³ The decisive factor for Dr. Loftus was that some of the witnesses testifying during the Demjanjuk Trial, due to their advanced age, could barely recall the names of their own children, or how they had only just arrived in the courtroom, while professing to be perfectly capable of identifying John Demjanjuk and to remember all the details of the events in the Treblinka Camp or elsewhere. Even though Dr. Loftus realized that the media hullabaloo about John Demjanjuk, about the Treblinka Camp and about the eyewitness testimonies given over the past few decades rendered any impartial, uninfluenced, probative testimony impossible, she refused to make her services as expert witness available to the defense, since she wanted to be on Israel's and the Jews' side in this trial, even though she was aware that in doing so she was deliberately opposing justice and truth. Her acknowledgement of the error she thus committed is devastating and well worth reading.

The unreliable nature of eyewitness testimony presented during the Demjanjuk Trial did not escape the attention of orthodox Holocaust scholars either, who, for a brief period of time, were heard making critical remarks in this regard. In 1986, for example, *The Jerusalem Post* published an interview with Shumel Krakowski, back then the director of the most dogmatic of all orthodox Holocaust institutions, Israel's Yad Vashem Museum:²⁴

"Krakowski says that many survivors, wanting 'to be part of history' may have let their imaginations run away with them. 'Many were never in the place where they claim to have witnessed atrocities, while others relied on second-hand information given them by friends or passing strangers' according to Krakowski. A large number of testimonies on file were later proved inaccurate when locations and dates could not pass an expert historian's appraisal."

Needless to say, in order to limit the damage done by his statements, Krakowski later backpedaled by denying what he had said on record, thus proving that he isn't more trustworthy than the average Holocaust witness either.²⁵

Also in the context of the Demjanjuk Trial, one of the most prestigious Holocaust scholars of the time, Jewish-American political scientist Raul Hilberg, expressly confirmed in 1986 the statement by Jewish scholar Samuel Gringauz that "most of the memoirs and reports [by

²⁴ Barbara Amouyal, "Doubts over Evidence of Camp Survivors," *Jerusalem Post*, Aug. 17, 1986.

²⁵ In a letter to the editor to the *Jerusalem Post*, published there on Aug. 21, 1986, Krakowski stated that he had admitted only "very few" testimonies to be inaccurate.

Holocaust survivors] are full of [...] exaggeration, [...] unchecked rumors, bias, partisan attacks and apologies.”²⁶

Aside from the manipulation of witnesses already mentioned, H. P. Rullmann tells of the many and varied insults, suspicions and threats hurled at witnesses for the defense, going as far as the arrests of those witnesses;²⁷ of orders issued by the court to ‘go easy’ on the witnesses for the prosecution, in other words, not to analyze or cross-examine their testimony;²⁸ of unchecked applause etc. by court spectators when witnesses for the prosecution made incredible and grotesque, incriminating statements;²⁸ of the live television broadcasting of the trial in Israeli schools as well as the worldwide broadcasting of trial highlights;²⁹ of the interpretation of Demjanjuk’s profession of innocence as stubborn denial motivated by a lack of remorse.³⁰

At the end, the fake ID card no longer played a significant part in the verdict that was handed down against Demjanjuk in April 1988, whereas it had been a vital element in his extradition to Israel. The Jerusalem Court pointed out that it had been the witnesses, first and foremost, who had proven Demjanjuk’s guilt beyond a doubt.

The ultimate climax of the trial was the verdict, which had been based exclusively on eyewitness testimony: it sentenced Demjanjuk to death by hanging and prompted an almost Purim-fest-like joyful dancing in the courtroom. Of course, Demjanjuk’s defense appealed this sentence.

The public statements of Dr. Loftus, one of the best-known experts on eyewitness testimony anywhere, already sufficed to discomfit the Jerusalem Court responsible for Demjanjuk’s appeal, since it had to expect that appeal proceedings would not only expose the SS ID card as fake, but also that the witnesses would be exposed as perjured liars, and by a Jewish expert, no less! This perspective must have been so unsettling for the never-forget-never-forgive factions among Jews that they tried pulling the emergency brake: On November 20, 1988, Demjanjuk’s attorney, Dov Eitan, had received a comprehensive report from the subject expert for the defense, a report which proved conclusively that the chief piece of evidence against Demjanjuk, the Trawniki ID card, was a fabrication. For the appeal date of December 4, 1988, Eitan injudiciously announced a surprise for the Jerusalem Court, but then, on November 29, 1988, he mysteriously plunged from a 15th-story window of the Eilon Hotel to his death.³¹ Dov Eitan’s (un?)timely death was never solved. At his funeral, the second defense attorney was attacked by someone who threw acid in his face.³²

By the early 1990s the case had taken on even far more interesting and, for Israel, more unpleasant aspects. In view of the fact that Demjanjuk’s expatriation and extradition had been obtained by fraud, by means of a faked ID card, an increasingly powerful lobby group in the United States began to speak out for the reversal of the Jerusalem verdict as well as for Demjanjuk’s return and repatriation to the States, since Israel was obviously not willing or able to conduct a lawful trial against a former U.S. citizen.

The American Member of Congress, James V. Traficant, and Patrick Buchanan, one of the best-known American columnists, and former advisor of President Reagan, numbered among the most active of these lobbyists. As early as 1986, Buchanan had called the trial of Demjanjuk a new Dreyfus Affair.³³ But in early 1990, Buchanan went a considerable step

farther when, regarding Demjanjuk's alleged mass murders in Treblinka, he wrote in *The Washington Times* and *The New York Post*:³⁴

"The problem is: Diesel engines do not emit enough carbon monoxide to kill anybody. The Environmental Protection Agency never requires emission inspections of Diesel cars or trucks. In 1988, ninety-seven youths, trapped 400 feet underground in a D.C. tunnel, while two locomotives spewed Diesel exhaust into the car, emerged unharmed after forty-five minutes. Demjanjuk's weapon of mass murder cannot kill."

In 1991 Pat Buchanan was George Bush sen.'s strongest Republican rival in the primaries for the American presidency. He did not deviate from his conviction even during these election campaigns. On television he even supplemented his previous statements by saying that Treblinka had no doubt been a terrible place where hundreds of thousands of Jews had been taken and where *thousands* had died – in other words, not hundreds of thousands, as was alleged!³⁵ So Israel saw itself faced with a powerful current in American politics and journalism which was not only close to providing the next President of the United States but which also disputed that Treblinka had been an extermination camp.

At the same time as these developments, several eastern European émigrés groups drew up reports in defense of John Demjanjuk, and concluded on the basis of substantial evidence that no mass murder could have taken place in Treblinka, and that for this reason alone, John Demjanjuk must be innocent, as must be any other defendant.³⁶

Only someone who was unaware of these events could have been surprised when the Jerusalem Appeal Court announced Demjanjuk's acquittal in the summer of 1993.³⁷ Demjanjuk was acquitted for lack of precisely that so-called evidence regarding his identity which had resulted in his death sentence before. Strangely enough, most of the American and all of the European media then proceeded to laud Israel as a state truly under the rule of law – even though the administration of justice in the Demjanjuk Trial had not measured up even remotely to any such standard. The gulf between a death sentence and an acquittal is too great. But if perchance the court had realized that it was the false statements of the witnesses that had resulted in a miscarriage of justice, then the witnesses should have been charged. But this was not done. For a time it was even debated in Israel whether one should not perhaps charge Demjanjuk for crimes he may have committed in the camps Sobibor and Flossenbürg, but eventually this option was rejected.³⁸ The iron had grown too hot for Israel, since any further trial could have resulted in other aspects of the Holocaust being drawn into undesirably controversial discussion. It is also possible that the collapse of the Soviet Union gave rise to factors – such as easier access to archives and to the supposed sites of the crimes – which made it more advisable to send Demjanjuk back to the United States in September 1993, acquitted, but nevertheless unlawfully handcuffed during his trip home.³⁹

In 1998, John Demjanjuk received his U.S. citizenship back,⁴⁰ only to have it revoked again in early 2002 after the OSI claimed that Demjanjuk allegedly had been a guard in the camps of Sobibor, Majdanek, and Flossenbürg.⁴¹ After an extended tug-of-war over what to do with Demjanjuk, he was eventually deported to Germany on May 11, 2009, and there put on trial again, this time for crimes allegedly committed at Sobibor and Flossenbürg. Since the German code of criminal procedure is rigged in such a way that it allows the courts, if push comes to shove, to deny the defense to say anything, or to reject at will any of the

defense's motion to introduce evidence, a guilty verdict was a foregone conclusion. On 12 May 2011, Demjanjuk, by then 91 years of age, was sentenced to five years imprisonment for aiding in the murder of 27,900 Jews at the former Sobibor Camp.⁴² The forged Trawniki ID card was again the central piece of evidence, plus more untrustworthy witness statements which cannot be challenged in Germany, as motions to do so are always rejected as attempts at "Holocaust denial", leading merely to the indictment of the defense lawyer for having tried to file such a motion.

Already when the trial in Germany started, Demjanjuk's former Israeli defense lawyer Yoram Sheftel predicted that, in the face of public and political pressure exerted on this case, only an Israeli court could have had the strength to acquit Demjanjuk, but no other western court would. Knowing that there was no new evidence supporting the case against Demjanjuk, in fact not even any "credible evidence to prove any crime connected with the Holocaust", he stated that he would not be impressed by a German guilty verdict.⁴³ In an interview with the Hebrew website *Arutz Sheva* right after the German guilty verdict, Sheftel called the German trial "a shameful farce." As to the evidence presented during that trial, he opined:⁴⁴

"Nothing has changed since then. Even during the trial in Germany, there was not one person who testified that Demjanjuk was Ivan from Sobibor, by virtue that he was seen there, and as such the conviction is a farce."

3. The Camps in the Treblinka Area

In an analysis of the eyewitness testimony and accounts existing with regard to the Treblinka group of camps, the first thing one notices is that they are completely contradictory to each other. The witness claims diverge so widely – not only where the numbers of victims are concerned, but also with respect to the alleged methods of killing, about the way the bodies and evidence were eliminated, and about the location, size form and equipment of the alleged extermination camp – that it is impossible to cull a plausible overall account from this material.⁴⁵ Udo Walendy has drawn up a detailed study of these contradictions and inconsistencies, to which readers interested in specifics are referred.⁴⁶ We shall touch only on the grossest discrepancies here and will then focus on the scenario on which the Holocaust dogmatists have agreed after a 50-year process of evolution and selection from among the 'usable eyewitness testimony,' even though such a practice by orthodox historians is devoid of any scientific value due to the selectivity with which the sources are treated.

3.1. The Malkinia Camp

Among the confused and mostly contradictory descriptions of the camp Treblinka II (*i.e.*, B) and the corresponding sketches of this camp,⁴⁷ which were also used in the Treblinka

Press, Evanston, Ill., 1995); A. Donat (ed.), *The Death Camp Treblinka*, Holocaust Library, New York

Trials of 1950-51, 1964-65 and 1969-70,⁴⁸ there is not one which clearly establishes that aside from the camp Treblinka I (A) and II (B), there was another camp, Malkinia, 3.7 miles north of Treblinka. This was a transit and delousing camp approximately 740' × 820' (607,000 sq.ft.) in size, probably for Jews being deported to destinations in Belarus and Ukraine.

In prison, more than 15 years after the fact, Kurt Franz – the main defendant in the Treblinka Trial of 1965 – drew a sketch, from memory, of the *Malkinia* Camp where he had been employed as of November 1942.⁴⁹ This sketch could perforce not be correct in every detail, considering the many years of constant influencing that had gone by, but it differed entirely and not only in its external form from Treblinka II (B) as it is shown on an official Polish layout.⁵⁰ As we know today, the camp as described by the witnesses is a mixture of conditions and elements from the camps Treblinka II and Malkinia. A stunning confirmation of Franz's camp sketch was found on an aerial photograph of May 13, 1944, which is held in the National Archives.⁵¹ This camp is also the source of the terms 'lower' and 'upper' camp, as Franz had already marked on his sketch. The smaller 'upper camp' was separated from the 'lower camp' by a road. Franz was able to label the buildings in the camp and to mark his sketch with a large number of the surnames of the personnel in Malkinia, including his own surname, Franz, in relation to certain areas of the camp. The fact that many eyewitnesses describe *this* camp casts a rather dubious light on these witness statements, as the transit camp Malkinia has never been suspected of harboring an extermination center.

3.2. The Treblinka II (B) Camp

Treblinka II has gone down in Holocaust history as an extermination camp, whereas the camp Treblinka I, closely associated with a gravel pit, has hardly figured in subject literature at all. Since it is beyond the scope of this study to analyze all the accounts that have been advanced with respect to Treblinka II, and since it is only our intent to consider the necessary prerequisites and consequences of the mass extermination alleged by the witnesses, we shall confine the following to the most striking points.

In a brochure from 1943, the World Jewish Congress reported that construction of a "slaughter house" for Jews from Poland and other European nations had begun in March 1942 in an area 12,350 acres in size.⁵² It is hard to imagine that even people with underdeveloped special thinking could seriously propose a camp almost 20 square miles in size, yet this figure nevertheless found its way into a prosecution document with the International Military Tribunal in Nuremberg.⁵³ This fact alone suffices to reveal the producer-directors of the extermination scenario of Treblinka II in a suspicious light.

This author has in his possession a copy of an official-looking plan of the camp Treblinka II (cf. Illustration 1), showing an archive number, two rubber stamps and a legend, but apparently no date. The scale of 1:2,000 is wrong, as this would result in only half the camp dimensions given. A camp sketch in a brochure of the Treblinka Museum shows the same shape as that on the official-looking plan, but gives a scale of 1:4,000. All camp sketches

known to date exhibit more or less considerable deviations in detail. In terms of the points of the compass, the various maps agree with each other but not with the air photos of expert John C. Ball.⁵⁴

T. Skowron has also shed some light on the state of these camp sketches, which were drawn up on the basis of eyewitness accounts; to date he has located more than 40 different sketches.⁵⁵

3.3. The Origin of the Current Version of Treblinka

Treblinka II was situated in an area by no means particularly remote, and it concealed few secrets. The train line leading from the village of Treblinka to Siedlice ran at a distance of all of 300 meters from the camp, parallel to the nearby road; scarcely two kilometers separated the camp from the hamlets of Wólka Okraglik in the east and Grady and Poniatowo in the west.⁵⁶ If one credits the testimony of eyewitnesses, lively contacts even existed between the camp inmates and the local populace, with which a lively barter trade flourished.⁵⁷ In fact, soon after the opening of the camp (July 23, 1942), information from it was reaching the outer world. This was essentially coming from Jews who had run away from Treblinka, from the populace which resided in the area surrounding the camp, as well as from the Polish railway workers who operated the trains with the deportees. In these reports, the following methods of killing were mentioned:

1. Exhaust gases of a motor in whose fuel "toxic substances" had been mixed (Report of the Polish underground newspaper *Informacja bieżąca*, October 5, 1942).⁵⁸
2. A gas with a delayed effect, which enabled the victims to leave the gas chamber and walk to the mass graves; there they lost consciousness and fell into the graves (*Informacja Bieżąca*, September 8, 1942).⁵⁹
3. A mobile gas chamber, which moved along the mass graves and unloaded the bodies into them (*Informacja bieżąca*, August 17, 1942).⁶⁰
4. Shooting with machine guns (Report of the Resistance to the Polish government-in-exile in London, March 31, 1943).⁶¹
5. Quicklime in the trains; the deportees arrived in Treblinka as corpses and were buried there (further report of the Resistance to the Polish government-in-exile, March 31, 1943).⁶¹
6. Electric current ("Ghetto Chronicle" of Emmanuel Ringelblum, entry for October 15, 1942).⁶²
7. Hot steam. This murder method was described in several reports and dominated propaganda concerning Treblinka up into 1944. Of capital importance in connection with this is an unusually detailed report dating from 15 November 1942, from the resistance movement of the Warsaw Ghetto with the title *Likwidacja żydowskiej Warszawy* (*Liquidation of Jewish Warsaw*), in which mass killing by means of steam is described as follows:⁶³

⁵⁴ G. Rudolf (ed.), *op. cit.* (note 51), pp. 128-131.

⁶³ The report is completely reproduced in K. Marczevska, W. Ważniewski, *op. cit.* (note 58), pp. 139-154. A complete English translation had already appeared in 1943 in the anthology Jacob Apenszlak (ed.), *The Black Book of Polish Jewry*, Roy Publishers, New York 1943, pp. 141-147, here pp. 142f., 145f.; see also Mattogno, Graf, *op. cit.* (note 46), pp. 52-57.

“It [the death house] is a brick construction [...]. It consists of only three chambers and a steam-room. Along the northern wall of this house runs a corridor from which there are doors to the chambers. The outside walls of the chambers have valves (until recently doors which had been changed into valves for utility reasons). Also here a scoop in the shape of a shallow vessel is placed at the height of the valves. The steam-room is adjacent to the building. Inside the steam-room there is a large vat which produces the steam. The hot steam comes into the chambers through pipes installed there, each having a prescribed number of vents. [...]

The floors of the chambers are slippery. The victims slip and fall, and they cannot get up for new numbers of forcibly driven victims fall upon them. The chief throws small children into the chambers over the heads of the women. When the execution chambers are filled the doors are hermetically closed and the slow suffocation of living people begins, brought about by the steam issuing from the numerous vents in the pipes. At the beginning, stifled cries penetrate to the outside; gradually they quiet down and 15 minutes later the execution is complete.

Now comes the turn of the grave-diggers. Shouting and cursing, the German overseers drive the diggers to their work, which consists of getting the bodies out of the execution chambers. The grave-diggers stand at the scoop, near the valves. The valves open but not a body falls out. Due to the steam all the bodies have become a homogenous mass stuck together with the perspiration of the victims. In their death agonies, arms, legs, trunks are intertwined into a gigantic macabre entanglement. To make it possible for the grave-diggers to get out single bodies, cold water from the near-by well is poured over the mass. Then the bodies separate and may be taken out. As a rule the surfaces of the bodies are not defaced; only the faces and buttocks are purple. The grave-diggers, constantly beaten and driven by the Germans, place the corpses on the scoops until the chambers are empty.”

According to this report, two million Jews had already been murdered in Treblinka by this method (thus, about 17,000 per day!); it said that, after the Germans had begun to also kill non-Jewish Poles with steam, the entire population of Poland had “the spectre of death in steam chambers” before its mind’s eye.

This report enjoyed wide circulation. A complete English translation appeared by the year 1943 in the omnibus volume *The Black Book of Polish Jewry*, and on August 8, 1943, the *New York Times*, in an article headlined “2,000,000 Murders by Nazis Charged. Polish Paper in London says Jews are Exterminated in Treblinka Death House,” reported that according to information from Poland, two million Jews had been murdered in Treblinka by steam.

In 1944, the Rabbi Abraham Silberschein published an eight-page report in Geneva concerning Treblinka, which largely adopted the claims of the resistance movement of the Warsaw Ghetto, but which was nevertheless ambiguous with regard to the technique used to do the killing: on the one hand, Silberschein spoke of “gas chambers” and of “gas which flows out of the pipes,” but on the other hand, of how the corpses stuck to one another “under the influence of the steam.”⁶⁴

For the orthodox ‘Holocaust’ historians, all of this is naturally most embarrassing, and many of them resort to shameless falsification of the historical sources. This is particularly true of the Israeli historian Yitzhak Arad, whose book *Belzec, Sobibor, Treblinka. The Operation Reinhard Death Camps* is regarded as the standard work about these three camps. Arad mentions in it the report of November 15, 1942, but brazenly substitutes “gas chambers” for the embarrassing steam chambers!⁶⁵

The suppression of the steam chambers in favor of gas chambers received its impetus from a report of the Jewish-Polish cabinetmaker Jankiel Wiernik, which first appeared in May 1944 in the Polish language but was then translated into English that same year.⁶⁶ Wiernik,

⁶⁴ Abraham Silberschein, *Die Judenauströpfung in Polen*, Geneve 1944, Third Series, pp. 33-40. Longer excerpts in Mattogno, Graf, *op. cit.* (note 46), pp. 58-61.

⁶⁵ Yitzhak Arad, *Belzec, Sobibor, Treblinka: The Operation Reinhard Death Camps*, Indiana University Press, Bloomington/Indianapolis 1987, p. 78.

⁶⁶ J. Wiernik, *A Year in Treblinka*, American Representation of the General Jewish Workers’ Union of Poland, New York 1944. Also reproduced in A. Donat, *op. cit.* (note 47).

who according to his statements had been interned in Treblinka for a year and had escaped from there, plagiarized in this text the report of the resistance movement of November 15, 1942, but replaced the steam chambers with gas chambers in every instance and mentioned a motor as the murder weapon, without, however, specifying that it had been a diesel motor. Evidently he believed – with good reason – that steam as a murder method was all too unbelievable.

Why did he choose a motor? In Treblinka there was certainly an electrical plant, since the camp was not connected to the local power supply. The generator of such a plant was customarily driven by a diesel motor. Since the exhaust fumes of such machinery have an atrocious odor, Wiernik, a layman with respect to the technical facts, obviously believed they made a suitable instrument for murder. After the Red Army had gained control over the area around Treblinka in August 1944, a Soviet investigatory commission quickly got to work and ‘determined’ that in Treblinka three million people had been killed. However, neither steam nor gas were now named as the method of murder, but instead suffocation by means of chambers which were vacuum-pumped:⁶⁷

“The ‘bath’ was a house that consisted of 12 cabins each 6 × 6m in size. They drove 400 to 500 people into one cabin at the same time. They had two doors, which could be hermetically sealed. In the corner, between ceiling and wall, there were two openings connected with hoses. Behind the ‘bath’ stood a machine. It pumped the air out of the room. The people suffocated in 6 to 10 minutes.”

The Soviet-Jewish propagandist Vassili Grossman entered the area of the former Treblinka camp in September 1944 and spoke with numerous witnesses who had already been questioned in advance by the Soviet investigatory commission. In his book *The Treblinka Hell*, an English translation of which appeared in 1946, he wrote:⁶⁸

“Various means were employed to effect this mass slaughter. One of them was by forcing into the chambers the exhaust fumes from the engine of a heavy tank that served as a motor at the Treblinka power station. [...] The second method, and one that was the most widely used, was pumping air out of the chambers with suction pumps [...]. The third method, used less but nevertheless used, was murder with steam. This method, too, aimed at depriving the organism of oxygen, [...]”

In addition to these three techniques, others were also described by witnesses. One of the best known of the Treblinka chief witnesses, Samuel Rajzman, on the occasion of being questioned by a Soviet military examining judge on 26 September 1944, stated that the killings in Treblinka were performed in the beginning “by means of evacuation of the air from the compartments,” but then – according to Rajzman, –⁶⁹

“then one resorted to other methods – poisoning by chlorine gas and Cylon-gas.”

The quotations cited make clear the incredible chaos which prevailed among the witnesses at that time with respect to the technology of murder in Treblinka. In December 1945, the Polish government, in a report presented to the Nuremberg Tribunal, was still speaking of how in Treblinka several hundred thousand Jews had been exterminated by steam,⁷⁰ yet at approximately the same time, the Polish judge Zdzisław Łukaszkiewicz, head of a committee charged with the investigation of the events in Treblinka, opted for the motor-gas chambers, apparently because this seemed to him to be the most believable of the diverse murder instruments described by the witnesses.⁷¹

It is worth remarking that the technique for killing which was also claimed for the “extermination camp” Belzec during the war and during the immediate post-war period, does not agree with the version later sanctioned by the official historiography.

⁶⁷ Akt 24, August 1944, Gosudarstvenny Arkhiv Rossiskoi Federatsii (State Archive of the Russian Federation), Moscow, 7021-115-11, pp. 103ff.

⁶⁹ USSR-337, p. 9 of the German version.

⁷⁰ PS-3311.

⁷¹ URSS-344, p. 321.

Various sources describe the methods for the alleged extermination camp Belzec, where, it is claimed, the victims were killed with electric current, on an enormous platform that could be submerged in water; the victims then said to have been immediately incinerated, using electricity.⁷² This account shows a complete lack of technical and scientific understanding; the excessive powers of imagination it attests to render an ordinary person speechless. I shall therefore dispense with a serious evaluation of it here, even though this tale was even accorded a hearing before the IMT.⁷³

The version of the diesel exhaust chambers made its final successful breakthrough in 1951. That was when a book titled *Bréviaire de la Haine* (Breviary of Hatred) appeared from the pen of the French-Jewish historian Léon Poliakov, which quickly became a classic of orthodox historiography. Poliakov cited a long excerpt there from the Gerstein Report, and commented on it as follows:⁷⁴

“There is little to add to this description, which holds good for Treblinka and Sobibor as well as for the Belzec camp. The latter installations were constructed in almost the very same way, and also used the exhaust carbon monoxide gases from Diesel motors as the death agent.”

In such a way were the steam and the suctioned-air chambers, as well as the various other murder methods hawked by the witnesses, finally consigned to the junkyard of history, and the diesel gas chambers of Treblinka, Belzec, and Sobibor became transmogrified into ‘established historical facts.’

4. The Extermination Camp Treblinka

According to the teachings of the Holocaust orthodoxy, a large part of the Polish Jews were deported to the Treblinka Extermination Camp as of the summer of 1942. Without first being registered in the camp, they were gassed in Diesel gas chambers, and buried in mass graves until winter. As of spring 1943, it is said, new gassing victims were immediately incinerated without leaving a trace, as were the exhumed bodies.⁷⁵ This was supposedly done in pits several meters deep and very long (formerly these pits were ‘mass graves’), on a grating of steel girders supported by concrete pillars. In autumn 1943, the camp was razed to the ground, and all evidence was eliminated. According to reports, some 870,000 to 1.2 million Jews fell victim to this scenario.⁷⁶ But before examining details of this account, we shall first present a general overview of the objects at hand.

4.1. Crime Scene and Murder Weapons in General

Under normal circumstances, solving a crime involves criminological investigations in order to obtain irrefutable evidence with which to convict the criminal. Since eyewitness statements are frequently very imprecise, it is the task of the courts to establish the true state of the matter on the basis of incontrovertible facts and evidence. Murder ranks among the most heinous of crimes, which is why it is particularly necessary in such cases to precisely establish the relevant facts. In such a crime, the scene of the crime, the murder weapon, the course

⁷⁵ Some witnesses claim that the cremations began in autumn of 1942; cf. R. Glazar, *op. cit.* (note 47), p. 34.

⁷⁶ E. Jäckel et.al. (eds.), *op. cit.* (note 47), p. 1430: 0.87 million; W. Benz (ed.), *Dimension des Völkermords*, Oldenbourg, Munich 1991, p. 468: 1.2 million.

of events, the cause of death, and the motive are generally investigated in order to ascertain the identity of the murderer. The whereabouts of the victims is also of central importance.

If the victim of an alleged crime cannot be located, it is difficult if not downright impossible to prove that the crime took place. In murders with only one or at most a very few victims, the elimination of evidence may be possible, provided that the site of the crime and the method of eliminating the victims remains unknown. If, however, the number of victims is extreme, and if the site of their elimination is precisely documented cartographically and even recorded on aerial photographs, then – given the standards of modern technology – the crime can be established with absolute certainty. One need only recall, for example, that in the course of archaeological digs the discovery of ashes suffices to establish the presence of human settlements beyond any doubt even hundreds of thousands of years after the fact. To date, forensic investigations of the Holocaust have been based almost exclusively on eyewitness testimony.⁷⁷ In only one single case is there a report of an excavation which the Siedlce Court had commissioned. This excavation was carried out in Treblinka II on November 9-13, 1945.⁷⁸ We shall touch on the results of this investigation a little later.

According to the supporters of the orthodox Holocaust narrative, the deportation, internment and killing of the Jews during the Second World War was a systematic and methodical program for purposes of exterminating the European Jews. The supposedly methodical and systematic nature of this campaign requires that there was a plan providing for it. To date, however, the sources available have yielded no evidence for a plan or its systematic implementation – unless all orders and decrees that are supposed to have been issued with respect to the solution of the Jewish Question were in the form of a secret code. But even for this no evidence has been uncovered, for no source has yet been found which contained a definition of the codes comprising such a secret language; however, such a ‘Rosetta Stone’ would have been indispensable to ensure a proper understanding between the issuers and the receivers of the orders. It was and remains a characteristic habit of the Germans to organize and document every measure taken right down to the smallest detail, and this practice was particularly evident among the authorities of the Third Reich. The Holocaust dogmatists’ theory that the mass murder was guided by improvisation, coincidences and spontaneity, and even by a decision-making process based on mind-reading,⁷⁹ is utterly implausible and downright ludicrous, not only for Germany but on the whole.

4.2. Crime Scene: the Upper Death Camp

As already mentioned, the dubious witness statements and the lack of any definite identification of the murder site by courts or commissions, as well as the commensurate lack of any efforts at securing evidence, preclude any exact and reliable reconstruction of the so-called site of the crime. The very fact that there are sketches of the site which show a rectangular camp area and others that show oblique-angled outlines with variant measurements compels one to view the matter with some doubt. Therefore, it would seem best to regard as the alleged site of the crime the ‘Treblinka II’ Camp which is shown on an official-looking ground plan and which appears on German aerial photographs from the year 1944.⁵¹ According to the archival plan of Treblinka, the camp had an area of 134,500 m² (1,447,200 sq.ft.), as stated, and the so-called extermination area measured some 18,000 m² (193,700 sq.ft.). Working from the air photos, the extermination area measured about 230 ft. × 295 ft., corresponding to an area of 67,800 sq.ft. According to the accounts at hand, the extermination area included the two buildings housing a total of 13 hermetically sealed gas

⁷⁷ There is one notable exception where a court in Adelaide, Australia, ordered the search and eventual exhumation of a mass grave in Ukraine in 1990 in order to establish that a claimed crime had indeed happened; see Richard Wright, “Where Are the Bodies? In the Ground,” in: *The Public Historian*, 32(1) (2010), pp. 96-107, esp. pp. 98f.; Derek Congram, “Deposition and Dispersal of Human Remains as a Result of Criminal Acts,” in: James T. Pokines, Steven A. Symes (eds.), *Manual of Forensic Taphonomy*, CRC Press, Boca Raton, 2013, pp. 249-285, here p. 260.

⁷⁸ Główna Komisja Badania Zbrodni Hitlerowskich w Polsce (ed.) (Central Commission for the Investigation of Hitlerite Crimes in Poland), *German Crimes in Poland*, Howard Fertig, New York 1982; cf. U. Walendy, *Historische Tatsachen* No. 44: “Der Fall Treblinka,” *op. cit.* (note 46), p. 15.

⁷⁹ E.g., cf. the statements of Jewish Holocaust expert Professor Dr. R. Hilberg, in *Newsday*, Feb. 23, 1983, part II/3: “an incredible meeting of minds, a consensus – mind-reading by a far-flung bureaucracy.”

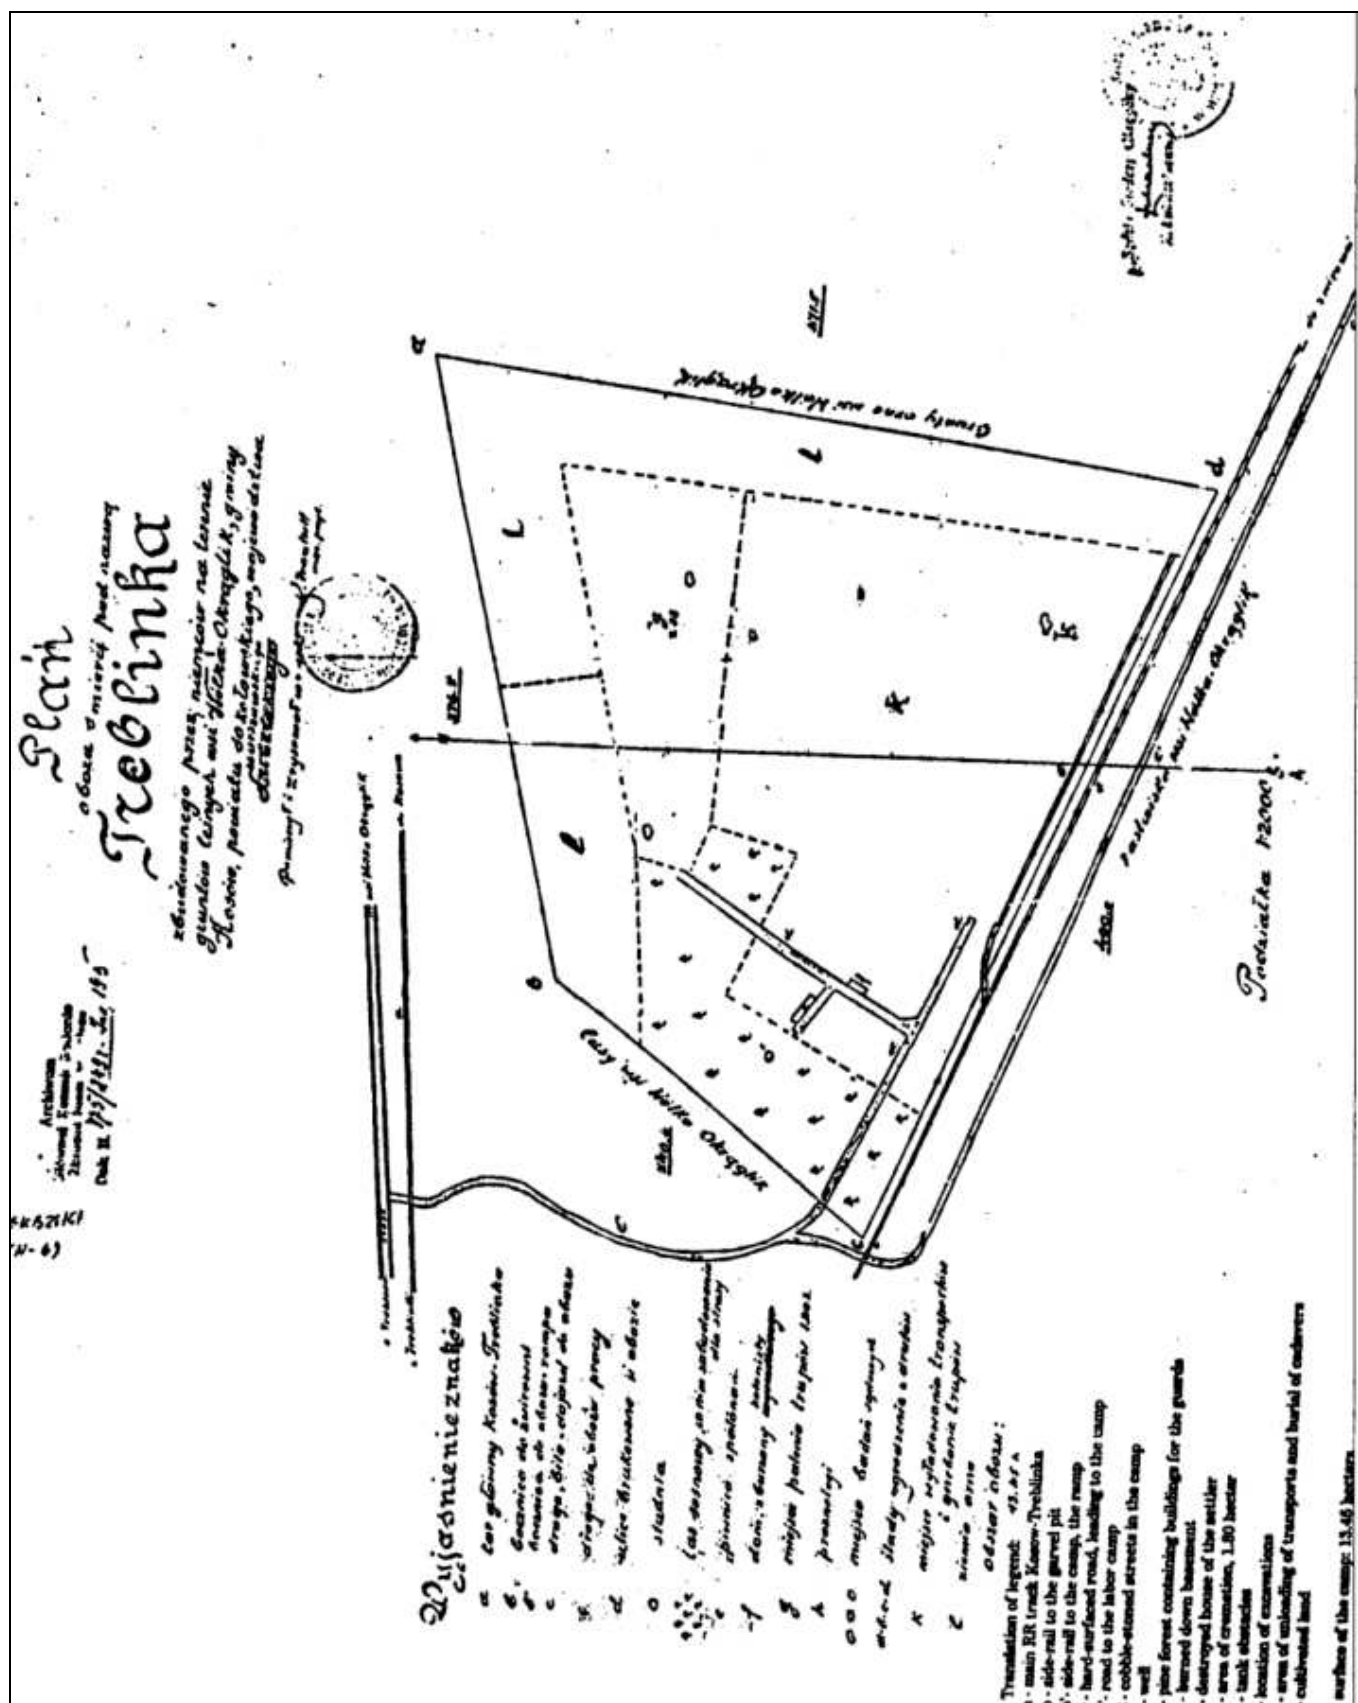

Illustration 1: Official map of Treblinka II.

chambers, as follows: the first Death House had three gas chambers of approximately 5 m × 5 m each (16 ft. × 16 ft.; other claims allege 4 m × 4 m/13 ft. × 13 ft.) and 2.6 m/8.5 ft. in height. It was a structure built in late summer and early autumn 1942. The second Death House, built a little later, had ten gas chambers and an area of 8 m × 4 m (26 ft. × 13 ft.; other claims are 7 m × 7 m/23 ft. × 23 ft.) per gas chamber, and was a stone building with a concrete foundation. Five gas chambers each flanked a 1.5 m/5 ft. wide corridor. The outer walls had gas-tight trap doors that could be pulled up in order to speed the emptying of the gas chambers. Adjoining the gable wall was the engine room, whence the Diesel-exhaust gas was piped into the chambers.

Whereas *The Black Book* of 1946 speaks of 4,000 to 6,000 people being squeezed into the chambers at one time, most sources are content with fewer than 2,000. The mass graves for accommodation of the bodies are also part of the immediate site of the crime. According to Eliahu Rosenberg,⁸⁰ these mass graves, located near the gas chambers, measured 120 m × 15 m × 6 m (394 ft. × 49 ft. × 20 ft.),⁸¹ but these dimensions vary from 164 ft. in length × 33 ft. in width × 16.4 ft. in depth to 492 ft. in length × 82 ft. in width × 33 ft. in depth (50 m × 10 m × 5 m to 150 m × 25 m × 10 m), depending on the source. Later the site of the crime was functionally enhanced by the addition of gratings, or grilles, for burning the bodies.

Drawing on the accounts provided by witnesses and the subject literature, we shall examine a few aspects of this, with an eye to the technical prerequisites and their feasibility. These are elements that ought to have been realized long ago, and taken into consideration in the relevant trials. To illustrate the absence of a critical mindset and the frightening incapacity for technical conceptualization on the part of judges and public prosecutors, the following example is taken from the book *Nazi Mass Murder*:⁸²

“The building was low, long, and broad. It was built of gray concrete and had a flat roof made of roofing felt [...]. Three steps without banisters led into the building. The chambers were 1.5 meters above the ground.”

This means that for each step the riser was an astonishing 50 cm/1 ft. 8 in. high, which would have been quite an obstacle in filling the gas chambers with the people to be gassed.

4.3. The Murder Weapon

In recent times no one has given any serious consideration to the alleged facilities for the production of high-temperature steam, of a vacuum, or of chlorine gas for mass killing; these claims have clearly been rejected for their absurdity. But it is inexplicable why witnesses, historians and the courts have agreed on Diesel-exhaust gas as the ‘murder weapon’ for Treblinka, Belzec and Sobibor (although they argue about the latter). It is quite incomprehensible why those planning the extermination of incredibly great numbers of Jews should have resorted to the exhaust from Diesel engines, since we know today from many environmental reports that the exhaust from gasoline-powered engines is a hundred times more poisonous than that from a Diesel engine. A comparison of the various witness statements does not clarify just exactly how the gas affected those locked into the gas chambers. Any grave toxic effects of the exhaust from a Diesel engine can be ruled out due to the low carbon monoxide content of said gas.⁸³ Piping Diesel-exhaust gas into the gas chambers would amount to a reduced but still adequate supply of oxygen to the rooms in question.

It is more than strange that the 1943 *Black Book of Polish Jewry*⁷² cites a CO content of 2 to 3% for Diesel exhaust – ten times more than is actually possible. It is not likely that this was printed in error, since the allegedly lethal nature of Diesel exhaust is still a vital brick in the foundation of the Holocaust. The value of 2 to 3% CO given for Diesel exhaust cannot be traced back to any witness statements. One may assume that the World Jewish Congress had subject experts at its disposal on this issue as well; the accompanying elaborations of the biochemical effects of CO on hemoglobin would suggest this.

⁸⁰ E. Rosenberg, in H. P. Rullmann, *op. cit.* (note 5), p. 137.

⁸¹ Cf. Y. Arad, *op. cit.* (note 47), pp. 33, 42; A. Donat, *op. cit.* (note 47), pp. 92, 153, 170f.

⁸² E. Kogon, H. Langbein, A. Rückerl, *op. cit.* (note 47), p. 128.

⁸³ Cf. F. P. Berg’s detailed chapter, this volume.

After escaping from the combustion chamber, the exhaust gases of internal combustion engines are channeled into an exhaust system for a number of reasons, whence they pass into the open air. If the gas escaping out the end of the exhaust pipe is stopped up, the pressure will increase until the engine stalls. The degree to which the pressure can rise varies with the type and construction of the engine.⁸⁴

According to the witnesses, the engines used to supply the gas chambers with gas were heavy Diesel engines taken from Soviet tanks, whose power ranged up to 550 hp. Since Diesel engines have a high compression ratio (1:15), it may be assumed that they are still able to function even if the pressure of the exhaust increases by 0.5 atm. after exiting the cylinder.

Now if these exhaust gases are channeled into a hermetically sealed room, the pressure there can also increase by 0.5 atm. (corresponding to a weight of 500g/cm², or 1,024 pounds per sq.ft.); this means that there would have been a force equivalent to the weight of 5 metric tons pushing outward against each square meter of surface area. This would have been the situation for any gassing as described by the witnesses claiming that the gas chamber was *hermetically* sealed. To illustrate the total force acting on the walls of the gas chamber, let us look at the dimensions of the chambers of Death House 2. Given the assumed height of 6.6 ft. and a room length of 26.25 ft., the wall surface area comes to about 173 sq.ft.; the force pushing outwards against the wall amounts to the equivalent of 80 metric tons. Imagine, if you will, three tractor-trailers of more than 25 tons each, simultaneously pushing against the wall!

The ceiling of this facility has a total surface area of 603 sq.ft. The force acting on it from below would be equivalent to the weight of 280 metric tons. The dead weight of such a ceiling is approximately 10 metric tons. If the ceiling did not actually lift off, it would at least snap in half upwards, since the steel reinforcement of reinforced ceilings is located in the lower third of the ceiling as seen in cross-section.

Since according to Rückerl *et al.* the floor of this gas chamber was 5 ft. above ground level, there must have been an empty space beneath it. Therefore the floor must have had a load-carrying capacity of more than 5 t/m². Ceilings and floors of 5 t/m² weight-bearing capacity would not have simply vanished into thin air after the war.

Similar considerations apply to the doors of the gas chambers. The aforementioned trap doors measured 8.2 ft. width × 6.6 ft. assumed height, *i.e.*, 54 sq.ft. The pressure brought to bear on them would thus have amounted to 25 tons pushing outward – and yet these doors still managed to remain airtight. No doubt such a highly engineered door would be a prized museum exhibit.

Regarding the weight put on walls, ceilings and doors, we shall quote *The Black Book* of 1946,¹⁶ which states:

“The second method, the one that was most widely used, was pumping air out of the chambers with suction pumps until the victims were dead.”

Rachel Auerbach cites a modified version, according to which the air was pumped out before the Diesel exhaust was piped in.⁸⁵ It clearly didn't occur to Ms. Auerbach that already the first half of this would have sufficed to kill the victims – if the gas chamber had survived the process from a construction point of view. For these methods of killing, the forces acting on the building would have been reversed in comparison to the previous, *i.e.*, acting inwardly from without, and of even greater intensity up to twice the previously demonstrated values, since the pressure difference between atmospheric pressure and a room pumped to near-vacuum conditions is approximately 1 bar (one atmosphere). It must be stressed that even considerably smaller pressure differences between the gas chamber and the atmosphere would have demolished the building.

Let us briefly consider how long it would have taken to attain an excess pressure of 0.5 atm. in the gas chamber of 603 sq.ft. area × 6.6 ft. height, *i.e.*, 3,980 cu.ft. Of the aforementioned Soviet Diesel engines, the W2 with 38 liter cubic capacity would be a possibility.⁸³ In a gassing situation, the air volume in the gas chamber (volume of chamber minus volume

⁸⁴ Exhaust-driven turbosuperchargers have a pressure requirement of 0.5 atm. and more.

⁸⁵ R. Auerbach, in A. Donat, *op. cit.* (note 47), pp. 35, 50.

of victims locked into it) would have been approximately 2,684 cu.ft. Assuming that the engine ran at 500 rpm, the volume of exhaust gas output would have been 335 cu.ft. per minute. The introduction of a total of 1,342 cu.ft. of exhaust gas would have increased the pressure in the gas chamber to 1.5 atm. within 4 minutes. Even running at full load and under the most unfavorable conditions, a Diesel engine does not put out enough toxins in this short time to suffice to kill anyone – but the volume of exhaust certainly would suffice to blow up hermetically sealed brick-walled rooms.

How would a homicidal gassing process even be possible if, for example, the ten gas chambers of Death House 2 were simultaneously filled with 6,000 people, as the *Black Book* reports? The hallway leading to the gas chambers was allegedly 5 ft. wide. This is just wide enough to allow two people to enter it side by side. So if the victims-to-be are lined up outside the Death House, two abreast and each 2 ft. behind the person before them, we end up with a line-up almost 1¼ miles long. Entering the Death House, filing into the gas chambers and filling them tightly with victims will allow a marching speed of the line-up of, perhaps, 1¼ miles per hour if the victims behave with great discipline and cooperation. The absurdity of the conditions required for this best-case scenario shows that one hour certainly would not have sufficed to crowd the 6,000 people forcibly into the chambers. This means that the victims in the chamber that was filled first might have already been locked up in their air-tight room for an hour or more before the gassing even began; for to assume that the gassing began as soon as the first chamber was filled contradicts eyewitness testimony, for example the claim that Ivan the Terrible not only drove the victims into the chambers but also operated the Diesel unit. He could not have done both at once. This further indicates that the victims locked up in the chamber that was filled first had less than 16 m³ oxygen available to them.

According to technical specifications for engineers, the oxygen requirement for people performing non-strenuous work is $\frac{2}{3}$ liters per minute. Under the conditions given – being crowded together in a small room – this is the least amount required. This means that 600 persons under the specified conditions use up some 400 liters of oxygen per minute, so that as long as consumption remained steady, the available oxygen would already have been completely used up within 40 minutes; dead bodies would have been all that was left in the chamber, long before the start of any gassing. In fact, oxygen consumption decreases with the onset of death, so that it would have taken the victims about one hour to suffocate. Even the witnesses ought to have noticed that. These, however, report that death by suffocation took 24 or even 48 hours when the Diesel engines failed to work; this account, therefore, must be rejected as being a sheer flight of fancy.⁸⁶

If, however, the chambers were not hermetically sealed and were only flushed with Diesel-exhaust gas, then the 15-17% oxygen content of the exhaust would not have been fatal.⁸⁷

Incidentally, it does not make sense that individual chambers should have been used for gassings, since one single large room would have been much more practical in terms of filling and emptying as described for the alleged scenario.

The divergent eyewitness testimony regarding the function of the Diesel engines in the camps necessitates further observations. From time to time it is claimed that the engines used for gassing also supplied electrical power to the camps.⁸⁸ According to the claims for Treblinka II, the lower camp already existed before the upper one was constructed. If the Diesel engine mentioned for the upper camp had been meant to supply the entire Treblinka II Camp, then the lower camp would have had to obtain its electricity from elsewhere until the upper camp was built. But if the engine had been intended to supply only the upper camp, this would have been technical nonsense, since due to the nature of the camp all that would

⁸⁶ R. Auerbach, *ibid.*, pp. 49f.; J. Wiernik, *ibid.*, p. 172.

⁸⁷ It should be mentioned here that resuscitations involve mouth-to-mouth breathing, and that the life-restoring breath (exhaled by the person performing the resuscitation) contains about 15% oxygen.

⁸⁸ J. Wiernik, in A. Donat, *op. cit.* (note 47), p. 157; verdict, Düsseldorf, *ibid.*, p. 300; Y. Arad, *op. cit.* (note 47), p. 42. However, these witnesses state that the engine used for generating electric power was an additional Diesel engine used independently of the gassing engine. We are working on the assumption that the witnesses were mistaken and that the gassing engine and the generator engine were one and the same, as that would have put a load on the engine, making the Diesel exhaust gases more toxic.

have been required was at most 100 light bulbs @ 75 Watt – a total of 7.5 kW – for lighting purposes. The Soviet tank engines had a power of up to 550 hp (\approx 400 KW), which is why no one would have used them to generate 7.5 kW of electricity. At such a low level, one may assume that the composition of the Diesel exhaust would have approximated that of an engine running at idle. One must also bear in mind that it is highly unlikely that engines from captured Soviet vehicles would have been used to generate electrical power, since in the case of a break-down it would have been close to impossible during wartime to obtain replacement parts for these engines. Eyewitnesses even tell of such defects and break-downs, and claim that they caused repeated delays in the gassings.

The water supply (the camp had its own well) was also dependent on electrical power. Since witnesses have reported time and again that the gassing engines were turned on for the gassings, and were turned off again after the gassings were finished (after 5 to 45 minutes⁸⁹), but the electrical and water supplies would have had to be present without interruption, one may consider it certain that the gassing engine in the upper camp cannot have served to generate electrical power for the lower camp. Treblinka II will thus have been connected to the power supply of the nearby town or probably had a separate power generator at its disposal.

Accounts of interruptions of the described gassings due to Diesel-engine failures are not restricted to Treblinka. For Belzec, SS *Obersturmführer* Gerstein reported such a failure of a Diesel engine⁸³ which was used solely for gassings, and would thus almost certainly have been run at idle – if Gerstein's report were correct, but this can almost definitely be ruled out.⁹⁰ Since according to Gerstein the people in the gas chambers remained alive for hours while the engine was out of service, the locked chamber must have been very well ventilated indeed.

Any serious plan to commit mass murder by means of exhaust gas would thus not only have provided for a different (non-Diesel) kind of engine, it would also have had to provide for back-up facilities.

All the considerations and calculations presented here are quite simple on the whole, and it is therefore utterly incomprehensible that such technical analyses have not been commissioned and carried out long ago. Another point which the courts really ought to have noted is that so far not one single case is known of a healthy person committing suicide with the exhaust gas from a Diesel engine, whereas suicide by means of exhaust from a gasoline-powered engine is unfortunately not at all a rare occurrence. Thus, the toxic effects of Diesel exhaust falsely alleged by the Holocaust dogmatists have not manifested themselves anywhere else.

The technical considerations set out in the foregoing show that the gas chambers as they are described would not have been physically able to serve as murder weapons as they are commonly believed to have done. The following investigation shall shed some light on the claimed removal of the bodies, which allegedly left no traces whatsoever.

5. Traceless Elimination of Corpses at Treblinka

5.1. Burial Pits

According to Eliahu Rosenberg,¹⁸ after the trap doors of the gas chambers were pulled up, the corpses (some 850,000 altogether) were taken to pits measuring 394 ft. in length, 49 ft. in breadth and 20 ft. in depth (120 m \times 15 m \times 6 m). Based on Rosenberg's testimony, and assuming a likely gradient of 65° in the sandy and gravelly terrain of the Treblinka area and a 50 cm/1.6 ft. soil layer to cover the mass grave, such a burial pit would have had a fillable volume of some 282,500 cu.ft. (8,000 m³).

Some witnesses have stated that the bodies were layered into the pit, and that each layer was covered with a layer of soil; others claim that the bodies were haphazardly thrown into the pit. Both situations would allow for approximately 8 bodies per cubic meter (10 per 44

⁸⁹ Y. Arad, *op. cit.* (note 47), pp. 69, 71, 86; A. Donat, *op. cit.* (note 47), pp. 36, 49, 159, 172, 311; R. Glazar, *op. cit.* (note 47), p. 19; J.-F. Steiner, *Treblinka*, Stalling, Oldenburg 1966, pp. 180, 213.

⁹⁰ Cf. Henri Roques, *The "Confessions" of Kurt Gerstein*, Institute for Historical Review, Costa Mesa 1989; C. Mattogno, *Rudolf Reder versus Kurt Gerstein*, 2nd ed., Castle Hill Publishers, Uckfield, 2021.

cubic ft.), meaning that the pits described would have accommodated about 64,000 bodies each. Interestingly enough, none of the witnesses mention the considerable amount of excavated soil, which came to about 339,000 cubic ft. per pit, given a 20% loosening-up of the soil (9,600 m³). The gradient of a pit dug in natural ground conditions is known to be much steeper than that of the pile of dug-up contents. If the surface area of the burial pit measured 19,300 sq.ft. (1,800 m²), as alleged, then given a gradient of approximately 30° for the excavated gravel or sand – and after subtracting approximately 35,300 cu.ft. (ca. 1,000 m³) for the material with which the corpses were covered – the area taken up by the dug-up material piled 20 ft. high along the pit would have been approximately 28,000 sq.ft. (2,600 m²).

According to the Slovenian historian Tone Ferenc,⁹¹ the upper extermination area, which is said to have been within the camp area of Treblinka II, covered an area of about 172,000 sq.ft. (16,000 m²); however, to forestall any objections on this score, we shall base our further considerations on the size of the extermination area indicated by the archival plan, namely about 193,700 sq.ft. (18,000 m²). This area held not only the burial pits and the material dug up in the course of their excavation, but gas chambers and other buildings as well. If one accepts the 875,000 dead mentioned in the Jerusalem Trial of John Demjanjuk, then 14 burial pits à la Rosenberg and a total of some 4.6 million cu.ft. (131,000 m³) of excavated soil would have been involved in the accommodation of all these bodies. Since these 14 pits would have taken up an area of 271,150 sq.ft. (25,200 m²), they could not have fit into the extermination area measuring only 193,700 sq.ft. Further, the piles of excavated soil resulting from the 14 burial pits would have required an additional area of more than 392,000 sq.ft. (36,400 m²).

If, on the other hand, one proceeds on the assumption that the claims of three million victims are correct, then 47 burial pits covering some 910,000 sq.ft. (84,600 m²) would have been needed; these would have taken up almost two-thirds of the area of Treblinka II – not even including the excavated soil going with them.

Finally, some comments on the allegedly 20-ft.-deep burial pits. First of all, it seems unlikely that the pits would have been dug that deep, as doing so would have required either complicated heavy machinery or increased expenses related to the construction of ramps. The excavators allegedly used in Treblinka would hardly have been adequate to this task.⁹² At depths of 20 ft., it is also probable that groundwater seepage occurs, which would have impeded or downright prevented the construction and use of pits of such depth. However there was a large gravel pit located near the Treblinka I Camp not far from Treblinka II, a groundwater level lower than 20 ft. is certainly conceivable. If one proceeds on the assumption of a more realistic pit depth of approximately 10 ft., then a pit of the aforementioned surface area would have held some 35,000 bodies, and 25 pits would have been needed, covering a total of 484,200 sq.ft. (45,000 m²) excluding the area taken up by the excavated soil. The excavated material itself would have required an area of 570,300 sq.ft. (53,000 m²), making for a total of almost 1.1 million sq.ft. (100,000 m²). For the alleged 3 million victims, 86 pits covering 1.67 million sq.ft. (155,000 m²) would have been needed, plus the corresponding area for the excavated soil.

In the case of Auschwitz and Majdanek, quantitative considerations based on events ‘attested to’ by witnesses, and on the technical and material consequences resulting from the alleged events, have brought about a constant and ongoing reduction in the number of victims.⁹³ Scientific facts have always been the enemy of religious dogma.

5.2. Elimination of the Corpses – Not Quite Tracelessly

The elimination of victims without a trace is a vital link in the chain of evidence for the Holocaust in general. Elimination without a trace is the prerequisite for an arbitrary number of victims. This is how the numbers of victims alleged for Treblinka come to vary from

⁹¹ In U. Walendy, “Der Fall Treblinka,” *op. cit.* (note 46), p. 11.

⁹² Cf. the pictures from K. Franz’s photo album, in G. Sereny, *op. cit.* (note 47), p. 210; A. Donat, *op. cit.* (note 47), p. 264; Y. Arad, *op. cit.* (note 47), p. 95. These excavators were used in the gravel pit near the Treblinka I Labor Camp, though.

⁹³ Cf. Subchapter 4.2. of G. Rudolf’s contribution about the statistics of Holocaust victims, this volume.

700,000 to 3 million – a phenomenon that also appears in other cases.⁹⁴ The casual treatment of such high numbers of victims seems questionable from the start, and ought to prompt those concerned with the topic to gather scientifically irrefutable facts so as to prevent the Holocaust from becoming a matter of faith. But smoke and mirrors as well as eyewitness testimony have been deemed good enough. The technically unrealistic claims regarding the mass murder of human beings are compounded by the utterly unbelievable accounts of the removal of bodies without any trace. Millions of dead cannot simply vanish into thin air. In this context the reader is referred to the case of Katyn, where the 4,500 Polish officers murdered by the Soviets in 1940 were discovered in 1943.⁹⁵

According to eyewitness testimony, Himmler ordered the incineration of bodies in the Treblinka Extermination Camp to eliminate any evidence of the killings; this order was allegedly given in March 1943.⁹⁶ This is said to have involved the exhumation and burning of the bodies that had already been buried. Various eyewitness accounts exist of this procedure in Treblinka, which allegedly went on from about March to August 1943.

Regarding the burning of the corpses, Eliahu Rosenberg has stated:⁹⁷

“After Himmler inspected the camp, he ordered the burning of all the bodies lying in the pit. [...] For this purpose, two iron rails were placed on the ground parallel to each other, and the bodies that were dug out of the pit with excavators were stacked on top of each other like fire logs. It frequently happened that the corpses, especially those just freshly killed, didn’t burn well, and so we had to pour gasoline over them. [...] At that time we had only one burning site, and of course that wasn’t enough, since we couldn’t burn more than a hundred bodies a day. An SS-Oberscharführer, Herbert Floss by name, was brought in from the neighboring camp. [...] He set up five or six burning sites, and also introduced a new way to layer the bodies.”

In his testimony in Jerusalem, at the Demjanjuk Trial, he also persisted in his convictions:⁹⁸

“In Treblinka we learned that little children burn better than grown men. All it takes is a match to light them. That’s why the Germans, damn them, ordered us to put the children in the pit first.”

The witness Szyja Warszawski, who came to Treblinka in July 1942, told of gassings with chlorine and of at least 10,000 victims a day, and stated with respect to cremation:⁹⁹

“Usually the bodies were put into pits 33 ft. deep and wide and many times as long. In January 1943 [...] five to six gratings were set up on the ground. The grates, which consisted of iron rails, were supported by cement posts about two feet above the ground. A grate like that was 33 ft. long and 13 ft. wide. A fire was started underneath. Bodies were layered on the burning grate with an excavator machine. Once the bodies caught fire, they continued burning by themselves. Mass cremation began in late February 1943. The ashes that remained after the burning were thrown back into the pits where the bodies had been dug out earlier. Sweet-peas were sown over top and trees brought over from the forest were planted to camouflage the site [...] For some pits the excavators only dug out the top layer of bodies. The rest of the bodies were covered over with soil, and the site was camouflaged as well.”

⁹⁴ For ex., cf. the chapters by H. Tiedemann about Babi Yar, G. Rudolf about Auschwitz and C. Mattogno on Majdanek in the present book.

⁹⁹ S. Warszawski, document of the Central Commission for the Investigation of the Hitlerite Crimes in Poland. The author has a German copy of the interrogation transcript. (cf. Główna Komisja Badania Zbrodni Hitlerowskich w Polsce (ed.), *Obozy hitlerowskie na ziemiach polskich 1939-1945. Informator encyklopedyczny*. Państwowe Wydawnictwo Naukowe, Warsaw 1979).

Without going into detail about the strange and contradictory claims in these statements, we shall add some excerpts from Vassili Grossman's book *The Treblinka Hell*, where the cremations are described as follows:¹⁰⁰

"At first there was considerable trouble with the cremation; the bodies would not burn. True, it was observed that the bodies of the women burned better. Large quantities of gasoline and oil were used up, but this was expensive and in any case the effect was insignificant. Things began to look serious, when there arrived from Germany a thickset SS man of about fifty, an expert in his line.

One cannot but marvel at the experts begotten by the Hitler regime – there were expert baby killers, expert stranglers, expert gas chamber designers [...]. So, too, an expert specializing in exhuming and burning millions of human bodies was found.

Under his direction they began to build furnaces. These were a special type of furnace, [...].

The excavator dug a pit 250-300 m. long, 20-25 m. wide and 6 m. deep. Three rows of evenly spaced reinforced concrete pillars 100-120 cm. high were installed across the length of the pit to support steel beams that were laid along them. Rails were then laid crosswise across these beams at intervals of five to seven centimetres. The result was the grating of a titanic firebox. [...] Soon afterwards a second and then a third furnace of like dimensions were built. Each of these furnaces took 3,500 to 4,000 corpses at a loading.

[...] People who took part in the work of cremating the corpses say that the ovens resembled volcanoes: [...] clouds of thick black smoke reached the sky and hung in a heavy motionless blanket in the air. Inhabitants of the neighbouring villages saw the flame at night from a distance of thirty and forty kilometres as it curled above the pine woods surrounding the camp. The stench of burning flesh poisoned the whole countryside."

Jankiel Wiernik, who is the only one of the witnesses to claim that he participated directly in the cremation for a longer period of time, writes:¹⁰¹

"It turned out that bodies of women burned more easily than those of men. Accordingly, the bodies of women were used for kindling the fires."

Richard Glazar comments succinctly:¹⁰²

"The human body does not burn particularly well, quite the opposite."

Rachel Auerbach has compiled various witness statements and summarized them thus:

*"Polish people still talk about the way soap was manufactured from the bodies of Jews [...]. The discovery of Professor Spanner's soap factory in Langfuhr proved that their suspicions had been well founded. Witnesses tell us that when the corpses were burned on pyres, pans would be placed beneath the racks to catch the fat as it ran off, but this has not been confirmed. But even if the Germans in Treblinka or at any of the other death factories failed to do this, and allowed so many tons of precious fat to go to waste, it could only have been an oversight on their part."*¹⁰³

"In Treblinka, as in other such places, significant advances were made in the science of annihilation, such as the highly original discovery that the bodies of women burned better than those of men.

*'Men won't burn without women.' [...] [T]he bodies of women were used to kindle, or, more accurately put, to build the fires among the piles of corpses [...] Blood, too, was found to be first-class combustion material. [...] Young corpses burn up quicker than old ones. [...] [W]ith the help of gasoline and the bodies of the fatter females, the pile of corpses finally burst into flames."*¹⁰⁴

Yitzhak Arad, pretending to be scientific, reports:

"[T]he corpses... [were] arranged [...] in layers on the roaster to a height of 2 meters. [...] When all was ready, dry wood and branches, which had been laid under the roaster,

¹⁰³ R. Auerbach, in A. Donat, *op. cit.* (note 47), pp. 32f.

¹⁰⁴ *Ibid.*, p. 38.

were ignited. The entire construction, with the bodies, was quickly engulfed in fire [...], and the flames would reach a height of up to 10 meters. [...] [T]he SS men in charge of the cremation became convinced that the corpses burned well enough without extra fuel. Yechiel Reichman, a member of the 'burning group,' writes: 'The SS 'expert' on body-burning ordered us to put women, particularly fat women, on the first layer of the grill, face down. The second layer could consist of whatever was brought – men, women, or children – and so on, layer on top of layer. [...]'¹⁰⁵

"These [fresh] bodies did not burn as well as those removed from the ditches [i.e., the graves] and had to be sprayed with fuel before they would burn."¹⁰⁶

But something does seem to have struck one of our Holocausters as odd. Jean-François Steiner vividly describes the problem resulting from the actual, enormous wood (fuel) requirements involved in cremation:¹⁰⁷

"The prime costs proved to be prohibitive: aside from the vast quantities of gasoline, just as many logs were needed as there were bodies. It was not a viable undertaking, for even if all the forests of Poland might still have been felled as a last resort, the gasoline supply would nevertheless run short. Stalingrad had fallen, and with that, the rich petroleum fields of the Caucasus had shimmered away into nothingness like a mirage."

But Jean-François Steiner, who also compiled many eyewitness statements, manages to find a way out of this predicament; he too came across the bodies that burn of their own accord:¹⁰⁸

"There were fire-resistant [bodies] as well as such that caught fire easily. The trick was to use the good ones to burn the bad. According to his [Herbert Floss's] research – which evidently had been far advanced – old bodies burned better than new ones, fat ones better than skinny ones, women better than men, and children not as well as women but better than men. From this it followed that old corpses of fat women were the ideal kind."

Some witness statements do in fact indicate that there were units in the camp whose task it was to supply firewood. While Abraham Krzepicki and Samuel Willenberg can only tell of a unit that tore branches off trees in order to decorate the fence surrounding the extermination camp with them, for camouflage purposes,¹⁰⁹ Y. Arad reports that a "wood commando" which initially had to provide only the wood required for construction and heating later also had to procure the wood needed for cremation.¹¹⁰ However, there is a consensus among the witnesses and Holocaust believers that the wood was only lit as a sort of camp fire underneath the mountains of corpses, until these had caught fire and burned on their own. Richard Glazar is the only one to be able to provide details of this "wood commando": it consisted of 25 men, whose efforts yielded so few twigs and branches that a "camouflage commando" of 25 men had to climb unfelled trees in order to break off additional branches, which were woven into the camp fences to keep outsiders from looking in.¹¹¹ Apparently, the "wood commando" did not fell many trees.

Incidentally, Steven Spielberg has shown himself quick to learn from the aforementioned 'witnesses': in one scene of his movie *Schindler's List* he shows a gigantic conveyor belt continually heaping bodies onto an enormous pile of corpses magically burning by themselves.¹¹²

5.3. Corpse Cremation or Burned Sacrifice?

Even though they are contradictory, the many eyewitness accounts do offer numerous details of the extermination activities in Treblinka II; on the other hand, the issue of the fuel necessary for the elimination of the bodies – that is, for their incineration – is ignored, glossed over, or dismissed with unacceptable claims. This consistent approach suggests that the is-

Hoffmann.

sue, not being resolvable, is repressed either consciously or unconsciously. Szyja Warszawski came up with what is no doubt the easiest solution to the fuel problem when he declared:

“[...] *Once the bodies caught fire they would continue burning by themselves,*”

and Grossman also took a turn in this direction when he stated:

“[...] *the bodies did not catch fire properly,*”

and

“[...] *kindling the bodies.*”

The witnesses appear to agree on the opinion that female corpses burn by themselves particularly well, and can thus serve to ignite and burn other corpses. These claims imply that mere kindling suffices to set corpses on fire.

However, this easy way out does not suffice to truly solve the problem of the cremation of corpses, for the worldwide presence and use of oil-, natural gas- or coal-fired cremation furnaces refutes it conclusively, as do all the laws of nature. Some 65% of the human body is unburnable water whose evaporation requires large amounts of energy.

When a major earthquake struck India in September 1993, claiming some 20,000 lives, it was feared that epidemics would break out if the fuel (wood) needed for the cremation of the bodies could not be procured in time. In India, where the cremation of bodies has been the rule rather than the exception for a long time, self-burning corpses have yet to be discovered, even though the country suffers from fuel shortage in this context.

Psychologists ought to investigate the patently false witness claims, since there is no scientific or literary precedent for any similar event which might have found its way into the witnesses' subconscious mind in the form of a literary experience. An event somewhat similar to the claims of the witnesses may be found in the German children's picture-book *Der Struwwelpeter*, well-known in the German cultural sphere of influence, where the dreadful fate of Little Pauline, a girl playing with matches, is described in order to deter children from doing the same. We read there:

*“All is burned, bones and all,
The poor child, neck and crop.
A little heap of ashes alone remains
and both shoes, so neat and fine.”*

If the story of Little Pauline, who burned up all by herself, and of the remaining little pile of ashes were the psychological key to the claims of Warszawski and the others, then Little Pauline's shoes, which failed to burn, might also be the key to Gerstein's story about Belzec, where a 5-year-old child allegedly had to take the shoes of the Jews who were to be gassed onto a 40-ft.-high(!) pile of shoes.⁹⁰ Possibly these oddly similar statements even lead back to another as yet unknown common source reflecting a key childhood experience. The author of the storybook is Dr. Heinrich Hoffmann; however, the Stars of David located in the original edition near the passage in question do not allow for any further conclusions.

Moving on, Grossman describes the furnace grating and states that three supports of reinforced concrete posts some 100 to 120 cm (40 inches) high with steel joists on them were set up along the length of the trench, across which rails were placed 5 to 7 cm (2 to 3 inches) apart.¹¹³ If we assume a width of each rail of some 10 cm,¹¹⁴ and an average gap width between them of 6 cm, then there would be about six rails per running meter, which – assuming a rail length of 20 m (the pits are said to have been 25–30 m wide) and a total length of the grate of 200 m (Grossman's pits were 250 to 300 m long) – would have resulted in a total rail length of $(20 \text{ m} \times 6 \text{ m}^{-1} \times 200 \text{ m}) = 24 \text{ km}$ or some 15 miles for just one such pit. To allow for the burning of the alleged millions of bodies, Grossman reports two further burning pits, making for a total rail length of 72 km or 45 miles. Where on earth did all these rails come from? According to Grossman, the grates were loaded with 3,500 to 4,000 corpses at a time. How were the bodies counted, and who distributed them on the grating, and how?

From the dimensions given, the surface area of one grating may be calculated as $(20 \text{ m} \times 200 \text{ m}) = 4,000 \text{ m}^2$ (38,700 sq.ft.); this means that for the three pits, the total grate surface area was $12,000 \text{ m}^2$ (116,000 sq.ft.), in other words, roughly the same area as the camp's entire extermination area. The total volume of soil excavated amounted to at least $(25 \text{ m} \times 250 \text{ m} \times 5 \text{ m} \times 1.2 \times 3 \text{ pits}) = 112,500 \text{ m}^3$ – 3.97 million cu.ft. – was of the same order of magnitude as that for the mass graves. Whereas Warszawski's much smaller grates held veritable mountains of dead bodies, Grossman is content with about one body per square meter of grating surface $(4,000 \div 20 \text{ m} \div 200 \text{ m} = 1 \text{ m}^2)$. Under these circumstances, however, it makes no sense to dig a pit 6 m (18 ft.) deep for a cremation grate that has only one thin layer of corpses on it.

Assuming that, in the case of Grossman, cremation could be finished in five hours (without turning the bones into ashes, which this method could not achieve), it is difficult to understand why cremation was carried on 'round the clock'; in any case, it would have been necessary to extinguish the fires every now and then, or let them burn out, in order to remove the ashes and to add more fuel. But who knows, perhaps the corpses available to Grossman were not only self-burning, but also burned without leaving any residue – he doesn't say. At any rate he makes no mention of the fuel.

The sick imagination on which such an account is based is not as astonishing as the fact that millions of people believe it. What became of the enormous number of rails and of the reinforced concrete pillars, and who carried out the transports?

Occasionally, witnesses have mentioned that bodies were burned with liquid fuel in pits in Treblinka II; methyl alcohol and gasoline were allegedly used.¹¹⁵ In such a case, as in all open-air incinerations, only a fraction of the energy released by the fuel in fact acts on the object to be burned, in contrast to suitable furnaces where insulated walls concentrate the heat in a small space.

If one wanted to incinerate bodies outdoors with liquid fuels, it would be necessary to prevent the fuel from seeping into the ground by placing metal pans underneath the burning grates. Because of the disadvantageous conditions, the quantity of energy required for cremation could not be less than that generated by solid fuels such as wood or coal. Regarding the cremation grates described, there would have been the additional problem of body parts

¹¹³ Cf. Y. Arad, *op. cit.* (note 47), pp. 171, 174; A. Donat, *op. cit.* (note 47), pp. 170f.

¹¹⁴ Rail profiles vary widely, depending on the type of carts running on them, on their speed and on the weight/load the rails are to bear; see https://en.wikipedia.org/wiki/Rail_profile#Europe.

¹¹⁵ E.g., B. A. Krzepicki, in A. Donat, *ibid.*, p. 92: he claims that old clothes, bags, and all kinds of garbage were used as fuel; cf. also J. Wiernik, in A. Donat, *ibid.*, p. 181: after being lit, the bodies burned on their own.

falling into the gasoline-filled pans, thus being extinguished. Pouring liquid fuel over human bodies can result in their charring but not in their incineration.¹¹⁶

While the complete incineration of a body in the retort of a crematorium requires at least 66 lbs. of coke fuel,¹¹⁷ then the equivalent incineration in the open air will require at least 16 gallons of gasoline, given a suitable set-up. Under the technical conditions described for Treblinka, the incineration of the 875,000 victims alleged in Jerusalem would have taken some 13.2 million gallons of gasoline. Given this daily requirement of fully 10 tank cars of gasoline – an overall total of no less than 2,000 – the train of tank cars would have been all of 9.3 miles long. And this at a time when every gallon of gasoline was badly needed for fighter planes and vehicles of all kinds!

According to a November 27, 1986, report of the New Delhi *Schenectady Gazette*, cremations and the consumption of wood involved therein (due to the lack of corpses that will burn by themselves) are a serious concern for the inhabitants of India, since entire forests have been cut down over time for just this purpose. According to this report, the daily incineration of 21,000 bodies requires 6,433 metric tons of wood, *i.e.*, 675 lbs. per body. In applying these conditions to Treblinka, we shall simplify the matter somewhat by ignoring the problems involved in the prior exhumation of the bodies; let it suffice to consider only one unreality, namely the incineration of the bodies.

To forestall objections of any kind, we shall reduce the consumption of wood for mass cremations from 675 lbs. to 440 lbs. per body.¹¹⁸ From various eyewitness accounts it follows that the cremation process lasted until early August, a total of about 185 days. This means that a minimum of 4,700 bodies had to be cremated every day, requiring 950 metric tons of dry wood daily. The engineering handbook *Hütte* indicates a volume of 74.15 cu.ft. per metric ton for spruce wood,¹¹⁹ and of 109.5 cu.ft. per metric ton for spruce wood fire logs.¹²⁰ This means that the volume of the wood needed in Treblinka daily for incinerating the corpses would have been about 104,000 cu.ft. This volume is perhaps easier to grasp when visualized as a stack 3 ft. high, 3 ft. wide and about 1.75 miles long. Every day!

The cremation gratings, described by Warszawski as measuring 13 ft. × 33 ft. and with 1.5 ft. elevation above the ground, had a spatial volume of approximately 650 cu.ft. underneath the grating. To ensure that the firewood would receive enough draft (oxygen), a maximum of 530 cu.ft. could have been placed underneath. This quantity corresponds to a net weight of 10,600 lbs. and would have sufficed for cremating 24 (twenty-four!) bodies. If one assumes that, in this case, the complete incineration of the bodies took only 2 hours (which, however, is far too short to be realistic), then even cremating ‘round-the-clock’ would have disposed of 288 bodies at most. The high piling-up of bodies on the grating, as it is described by witnesses, would have brought nothing but disadvantages, if only due to the inhibited access granted the flames. But if 4,700 bodies had to be burned every day, this would have required more than 16 gratings as described above, with a total surface area of 6,890 sq.ft.

Stoking the cremation sites with wood, and removing the ashes and skeletons, are elements which have been ignored to date. Given the heat of the fire under the gratings and the stench of the burning bodies, it would have been impossible to perform these necessary tasks while the fire was burning. It is thus safe to say that continuous cremation in the manner

¹¹⁶ This was determined by two reports which, being of Communist origin, are above suspicion of pro-Nazi bias. These reports were drawn up for the East German and Soviet military in order to determine whether it would be possible, in the event of mass deaths due to war, to dispose of bodies in the open air: J. Loscher, H. Schumann (eds.), *Militärhygiene und Feldepidemiologie*, Militärverlag der DDR, Berlin 1987; E.I. Smirnov (ed.), *Опыт Советской Медицины в Великой Отечественной Войне 1941-1945* (The Experience of Soviet Medicine in the Great Patriotic War 1941-1945), Vol. 33: “Hygiene”, Moscow 1955, esp. pp. 236ff.; cf. also the chapter by C. Mattogno, this volume.

¹¹⁷ Cf. the chapter by C. Mattogno, this volume.

¹¹⁸ Based on experiments with the cremation of animal flesh, Carlo Mattogno calculated a need of some 350 lbs (160 kg) of dried wood for the cremation of a corpse of 98 lbs (45 kg), or 583 lbs of wood for a 165 lbs corpse. C. Mattogno, “Combustion Experiments with Flesh and Animal Fat,” *The Revisionist*, 2(1) (2004), pp. 64-72.

¹¹⁹ Akademischer Verein Hütte, *Hütte*, Vol. 1, 28th ed., Ernst & Sohn, Berlin 1955, p. 1037.

¹²⁰ *Ibid.*, p. 1035.

described, and using the burning sites described by the witnesses, would not have been possible. Burning the 4,700 bodies would have required at least twice the number of gratings.

With reference to the number of bodies to be incinerated, we still need to examine the source, processing and transportation of the needed quantities of firewood. The total cremation process in Treblinka would have required 430 million pounds, or 195,000 metric tons, of air-dried (seasoned) wood. Due to the short notice and brief time that Himmler allegedly allotted for this process, such a large quantity of air-dried wood would certainly have been impossible to get, which is why only fresh (“green”) wood of lower calorific value would have been available. The calorific value of seasoned wood is 3,600 kcal/kg, whereas that of green wood is only 2,000 kcal/kg.¹²¹ Therefore the total required quantity of wood would have increased to 351,000 metric tons, and the daily requirement of green wood was thus approximately 1,900 metric tons. Assuming medium-sized trees of 1 cord volume and 1,500 lbs., the total number of trees needed comes to roughly 515,000, or $(515,000 \div 150 \text{ days} =) 3,450$ trees per day.

There were two options for obtaining the required quantity of wood: either there was a large forested area near the camp where the demand for firewood could be met, and whence the wood would then be transported to the camp with suitable vehicles, or the wood had to be brought in from other areas by rail.

Let us suppose for the moment that the wood supply was nearby. Assuming that a 15-ton truck can make 3 runs daily, allowing for loading and unloading of the truck, then 156 trips would need to be made daily, using some 42 trucks. None of the eyewitness statements indicate the presence of such a fleet of trucks. The same goes for the labor force required for the daily felling, limbing, sawing and splitting as well as loading and unloading of 3,450 trees. If, given the primitive conditions that prevailed, we assume that two men could have processed – that is, felled, limbed, sawed and split – one tree per day (an utter illusion), then the lumberjacks would clearly have had to number at least 6,900.

To give an idea of how large a forest would need to be in order to supply such vast quantities of wood, let us assume a yield of 325 cord per acre, which for 515,000 trees would require a forest of 1,590 acres, or just short of 2.5 square miles. To put it more graphically, such a forest would have been 2.5 miles long and 1 mile wide. Is it really conceivable that the witnesses and the local residents could have failed to notice such a large deforested area? The site would still be apparent today.

If one proceeds instead on the assumption that the quantity of wood needed would not have been available locally, then it would have had to be brought in from elsewhere, for example in the form of large fire logs, in rail wagons. If one performs the corresponding calculations for this scenario with freight cars of a capacity of 30 metric tons of wood each, then a freight train of $(2,340 \text{ t} \div 30 \text{ t} =) 78$ cars of 30 metric tons each would have had to be unloaded in the camp every day – a total of 150 such freight trains. With a railway-cart length of 14 m,¹²² such a train would have been 1.092 km long – without locomotives. In the end, the total length of all the trains together would have exceeded 160 km, or 100 miles. This begs the question: where are the pertinent Reichsbahn (German Railway) documents about these enormous wood transports? If they existed, the orthodoxy would have presented them eagerly a long time ago.

Regarding the claim that the 875,000 corpses were eliminated completely without any trace, we must consider the quantities of bones and ashes that remain. The quantities of wood ashes are considerable, and vary with the type of wood. We shall postulate the low value of 3 kg/6.6 lbs. per ton of dry wood.¹²⁰ The wood ashes remaining would then have weighed approximately $(195,000,000 \text{ kg} \times 3 \text{ kg}/1000 \text{ kg} =) 585$ metric tons; the equivalent of the payload of 58 10-ton trucks. However, since outdoor fires under the circumstances considered are necessarily incomplete, leaving behind not just ashes but partially burned wood and charcoal as well, the amount of remains to be removed is much closer to 80 kg per metric ton of wood, as experiments have shown,¹¹⁸ which would be 26-times the amount indicated: 15,600 metric tons, hence 1,560 10-ton trucks.

¹²¹ *Ibid.*, p. 1243.

¹²² A German four-axle open railway car with a loading volume of 71 m³ would have been needed; https://de.wikipedia.org/wiki/Offener_G%C3%BCterwagen

The ash content of a human body makes up about 5.6% of the body's weight;¹²³ given a 132 lb. (70 kg) body, this comes to 7.3 lbs (3.3 kg). Again considering that outdoor cremations on pyres are incomplete, assuming twice the amount of remains seems conservative, hence 14.3 lbs per corpse (6.6 kg). The ashes from the 875,000 burned bodies would thus have weighed 577.5 metric tons (6,387,500 lbs.). The total quantity of ashes – wood ashes plus human ashes – would therefore have weighed (15,600 t + 577.5 t =) 16,177 metric tons, or 35.7 million pounds, all of which (according to the witnesses) were then mixed with the soil and thrown back into the pits.¹²⁴ Even if this quantity of ash had been mixed with the roughly 3.53 million cubic feet of soil excavated from the burial pits, it would be easy to find evidence for human remains of the quantity alleged by the witnesses. It must also be noted that, with the incineration of corpses under the conditions specified by the witnesses, many if not most of the bones would not have turned to ash, but would have remained as bones.

The witnesses have described how the skeletal remains of the corpses were broken up, and screened and sifted over and over again to ensure that no evidence would remain. Given the primitive equipment described by the witnesses – wooden stampers and thin sheets of metal for crushing the bones – it might have been possible for a man to break up and sift two skeletons per hour in the manner specified. Thus, if one Jewish laborer had sifted through and pulverized the remains of 20 skeletons per day, (5,800 ÷ 20 =) 290 Jewish laborers would have been needed for this task alone. Adding up the required personnel – 6,900 Jewish laborers for obtaining the wood, 290 for pulverizing the bones, and 150 to stoke the fire sites (50 per pyre) – fully 7,340 Jewish workers would have been needed to complete all the required tasks in a solid seven-day work week. Additionally, further hundreds of Jewish workers would have been needed to carry out various other tasks reported by witnesses: excavating and filling trenches, camouflage activities, sorting the valuables of the murdered Jews, cutting the hair and extracting the gold teeth of the victims, rendering services to the SS, administration, rations and supplies for the camp, etc. There would also have to have been reserve labor standing by at all times. Thus the camp would have had to have a permanent workforce of at least 8,000. This number stands in glaring contrast to the mere 700 Jewish laborers attested to for Treblinka.¹²⁵

As mentioned above, Grossman's claim that 6-m deep pits were dug for the combustion grates he described makes no sense. Which solution to the problem of mass cremation would have made sense has been demonstrated by experiences gathered during the mass incineration of animal carcass outdoors, which make the entire Treblinka scenario alleged by witnesses even more absurd. The basis of these experiences is the mass incineration of livestock that had become necessary due to foot-and-mouth disease. In particular, the epidemic that broke out in England in 2001 is worth mentioning,¹²⁶ during which some six million cattle, pigs and sheep perished – the number is purely coincidental. Due to the lack of cremation capacity of Britain's animal-carcass incineration plants, most of these livestock carcasses had to be incinerated, or at least charred, on pyres outdoors.

The documentation compiled during this epidemic was gathered by a German researcher who took the following parameters from it, which we haven't considered here yet:¹²⁷

1. In order to be able to service the entire surface of a pyre, it should not be wider than 2.5 m (8.2 ft) and not higher than 2 m (6.6 ft), the latter also in order to prevent the heap from toppling over. Furthermore, for ease of maintenance – assembling and clearing the pyre – it should be sunk into the ground only slightly, but certainly not in pits several meters deep. Grossman's grates would not have been 20 meters wide, but only one-eighth of it, and the usable area would be correspondingly (200 m × 2.5 m =) 500 m² per grate.

¹²⁴ Cf. A. Donat, *op. cit.* (note 47), p. 181; Y. Arad, *op. cit.* (note 47), pp. 171, 176.

¹²⁵ J. Wiernik, in A. Donat, *op. cit.* (note 47), p. 155.

¹²⁶ See https://en.wikipedia.org/wiki/2001_United_Kingdom_foot-and-mouth_outbreak.

¹²⁷ Heinrich Köchel, "Outdoor Incineration of Livestock Carcasses," *Inconvenient History*, 7(1) (2015); updated in: C. Mattogno, *Auschwitz: Open-Air Incinerations*, 2nd ed., Castle Hill Publishers, Uckfield 2016, pp. 128-140.

2. From these constraints it results that the packing density of such a pyre, when using fresh wood, would be about 4 to 5 average human corpses per running meter (3.3 ft), hence up to 2,500 corpses on Grossman's grate (or 3,125, if we extend his grate to 250 m).
3. Pyres of these sizes generally burn a whole day long, but the heat of the embers under the upper ash layer continues for days, up to a week if the heap is left undisturbed.
4. The infernal heat generated by such pyres makes it impossible to stay in its vicinity for a prolonged period without protective clothing, let alone to work there. In case such pyres are located close to each other, one had to leave a minimal distance of approximately 50 m (164 ft) between them in order to enable work at either of these pyres while the other was burning. This also takes into consideration that sufficient space had to be available for the transport of bodies and fuel, as well as for the removal of ashes and other burnt residue.

If assuming that it took two days for a pyre to burn down, for the embers to cease glowing, and for the pyre to cool down – red-hot ashes cannot be sifted by hand¹²⁸ – four types of Grossman's grates, reduced to a width of 2.5 m, would have been needed for the 5,800 bodies daily. Assuming that these were *not* placed in deep pits but only slightly sunk into the ground, and each at a distance of 50 m from each other, the four pyres required an area of $[(4 \times 2.5 \text{ m} + 3 \times 50 \text{ m}) \times 250 \text{ m}] =$ some 40,000 m² (387,000 sq.ft.; instead of the 12,000 m²/116,000 sq.ft. for the three burning pits calculated earlier), which is more than twice the surface area of the claimed extermination area. However, the enormous amounts of excavated soil for the claimed deep pits would be eliminated.

All this shows that the stories spread by Grossman and many Holocaust witnesses about burning pits several meters deep, which are utter nonsense from a practical point of view, are the result of a vivid imagination.

All these calculations are based on the number of victims (875,000) specified by the Jerusalem court. If, on the other hand, one were to postulate the 3 million Treblinka victims alleged by Grossman and others, then the data ascertained in the previous must be multiplied by a factor of 3.5.

5.4. Post-War Forensic Investigations

5.4.1. Soviet Investigation in 1944

Immediately after their conquest of the area around the former Treblinka Camp in mid-August 1944, the Soviets established a commission and conducted an investigation between 15 and 23 August on the former site of the Treblinka I and Treblinka II camps.¹²⁹ Only in the Treblinka I Camp, however, did they find several individual graves and a few smaller mass graves with altogether about 300 bodies. Nevertheless, they did not shy away from writing the following in their report, among other things:¹³⁰

"The camp Treblinka II was an enormous death combine. [...]"

The 'bath' was a house, which consisted of 12 cabins, each 6 × 6 m in size. 400 to 500 people were driven at a time into one cabin. It had two doors, which could be sealed hermetically. In the corner, between ceiling and wall, were two openings connected with hoses. Behind the 'bath' stood a machine. It pumped the air out of the room. The people suffocated within 6 to 10 minutes. [...]"

The statements of the witnesses, the book 'A Year in Treblinka' [by Jankiel Wiernik], [...] confirm that there were ovens in the camp where people were cremated. [...]"

At present it is difficult to uncover the traces and secrets of this oven for the cremation of people, but based upon the available data, one can picture it. [...]"

¹²⁸ Of course, it would have been possible to extinguish the pyres with water towards the end, but that would have meant that there would have been much more cremation remains, and that it would have been impossible to sift through the resulting sludge – quite apart from the fact that such extinguishing is never mentioned by any witness.

¹²⁹ GARF, 7021-115-11, pp. 15-43.

¹³⁰ Akt, August 24, 1944. GARF, 7021-115-9, pp. 103-110.

The oven – this was a large trench 250-300 m in length, 20-25 m in width and 5-6 m deep, excavated by an excavator. Driven into the bottom of the ditch were three rows of reinforced concrete posts, one-and-a-half m in height each. The posts were connected to one another by cross-beams. On these cross-beams rails were placed at intervals of 5 to 7 cm.”

Hence, the Soviets went into this investigation with a preconceived notion shaped by the uberliar Jankiel Wiernik,¹³¹ even though they could not find any material traces of the alleged atrocities in the Treblinka II Camp itself. The report concludes with six "conclusions", the first of which is also the most mendacious:

“On the basis of the preliminary facts, the cremation of people has been determined beyond a doubt. The extent of the extermination of human beings was monstrous: about three million.”

A few weeks later, on 15 September, another report was written where we can read, among other things:¹³²

“[...] it was actually a gas chamber consisting of three rooms. In the beginning, the method of pumping the air out of rooms by means of a small auto engine was employed. Then, as a result of the great number of those destined for death, they began to use chemicals. About 400 people could be crowded into this space at a time. On the roof of this – hermetically sealable – building was a small window, through which the death struggle of the dying could be observed.”

Hence, nothing more than propaganda.¹³³

5.4.2. Polish Investigation in 1945

No sooner had the Soviets laid down the spade than the Poles picked it up again. Although they carried out intensive excavations on the former site of the Treblinka II Camp between 9 and 13 November 1945, the result was disappointing, as the examining magistrate Zdzisław Łukasziewicz stated in his decision to halt the excavations:¹³⁴

“The Examining Judge of Siedlce, on November 13, 1945, rules in consideration of the fact that with great probability no mass graves are any longer to be found on the grounds of the former camp today, [...] in view of all these facts that work on the territory of the former death camp Treblinka is to stop.”

After the conclusion of his preliminary investigations, Łukasziewicz issued a protocol which was presented by the Soviets at the Nuremberg Trial as Document USSR-344. In the third paragraph, which bears the title “Current condition of the camp terrain,” it says the following:¹³⁵

“No remnants of facilities of the former death camp exist any longer. [...] Nonetheless, there are still other traces that hint at the existence and functions of the camp. In the northwestern section of the area, the surface is covered for about 2 hectares by a mixture of ashes and sand. In this mixture, one finds countless human bones, often still covered with tissue remains, which are in a condition of decomposition. [...] At a distance of some 100 m, there is now an unpleasant odor of burning and decay.”

Attempts to determine the dimensions of former mass graves and the amount of human remains were evidently not made.¹³⁶

It is worth noting that Łukasziewicz found bomb craters in the area of the alleged extermination camp, which were up to 6 meters deep and 20 meters in diameter. That must have been very big bombs. Since these craters cannot be seen on aerial photographs from 1944

¹³¹ For a more detailed critique of Jankiel Wiernik's testimonies see the book by Mattogno and Graf, *op. cit.* (note 46), passim, especially Section II.5.

¹³² GARF, 7021-115-11, pp. 43-47.

¹³³ For more details see Section III.1. in the book by Mattogno and Graf, *op. cit.* (note 46).

¹³⁴ Document reproduced in Stanisław Wojtczak, “Karny obóz pracy Treblinka I i ośrodek zagłady Treblinka II,” in: *Biuletyn Głównej Komisji Badania Zbrodni Hitlerowskich w Polsce*, Warsaw 1975, Vol. XXVI, pp. 183-185, here p. 185.

¹³⁵ USSR-344. GARF, 7445-2-126, pp. 19a-20 (pp. 3f. of the report).

¹³⁶ For more details see Section III.2. in the book by Mattogno and Graf, *op. cit.* (note 46).

after the German retreat,¹³⁷ one must assume that the Red Army has bombed the area after the conquest. That could explain why Łukasziewicz found isolated, widely scattered body parts, but no connected corpses.

5.4.3. Australian Investigation in 1999

In October 1999, an expert team led by Australian engineer Richard Krege scanned some parts of the soil of the alleged Treblinka Extermination Camp with a ground-penetrating radar device (GPR) that he thought were the location of the former mass graves. A ground-penetrating radar device detects any disturbances of the soil layers, caused either by objects or by former digging activities, up to a depth of 20 meters (65 feet). The data gathered by Krege, however, did not show any evidence of disturbance in the soil whatsoever. Due to a lack of funding and time, however, he was unable to scan the rest of the camp. Some of the information leaked out,¹³⁸ but Krege refused to publish his entire dataset, because he considered it inconclusive, requiring much more data to allow for any tenable conclusions to be drawn from it.

In fact, since the Polish investigators dug up quite a few trenches in 1946, and because they also reported that the camp had been bombarded, leaving bombing craters of up to 6 m deep, and that locals had undertaken wild digs in search for valuables, any thorough GPR scan must at least find these features of disturbed soil – in addition to any hypothetical mass graves or remains thereof.

5.4.4. British Investigation in 2011-2013

Haunted by the threat of a revisionist leadership in forensically investigating the Treblinka Camp with modern technology, a British team of forensic experts led by PhD student Caroline Sturdy Colls from the University of Birmingham set out in 2010 to find traces of the gas chambers as well as of the mass graves and incineration pits at Treblinka II using GPR and Lidar technology.¹³⁹

To this very day, the results of this research evidently have not yet been published,¹⁴⁰ but the British Broadcasting Company BBC featured first a radio program about it,¹⁴¹ which was also published as an article,¹⁴² and then as a TV documentary in collaboration with the Smithsonian Institution, which aired in the U.S. on April 3, 2013.¹⁴³

¹³⁷ See the contribution by John Ball in the present book.

¹³⁸ Richard Krege, “‘Vernichtungslager’ Treblinka – archäologisch betrachtet,” *VffG* 4(1) (2000), pp. 62–64; English: Richard Krege, “The 1999 Krege Report on the Treblinka Extermination Camp,” Feb 12, 2012; <https://codoh.com/library/document/6411/>; see also the brief documentary on this: R. Krege, “Forensic Investigation of Treblinka,” Jan 1, 2001; <https://codoh.com/media/files/downloads/treblinka.mpg>.

¹³⁹ Light detection and ranging, a method similar to radar, only it uses visible light; see <https://en.wikipedia.org/wiki/Lidar>.

¹⁴⁰ In her published PhD thesis: Caroline Sturdy Colls, *Holocaust Archaeologies: Approaches and Future Directions*, Springer, Cham, 2015, on pp. 51, 83, she cites herself as Sturdy Colls, C. (2014b). *Finding Treblinka: Archaeological Evaluation*. Unpublished Fieldwork Report. Stoke on Trent: Centre of Archaeology, Staffordshire University. Her website cites it as “In Prep.”: <https://www.staffs.ac.uk/staff/profiles/cs30.jsp#publications>. In other papers, she simply refers to her PhD thesis, which does not go into specifics of her Treblinka research: Caroline Sturdy Colls, “Gone but not Forgotten: Archaeological approaches to the site of the former Treblinka Extermination Camp in Poland,” *Holocaust Studies and Materials* (English edition), 3 (2013), pp. 253–289; and *idem*, “Une cartographie de la terreur nazie: études archéologiques dans les camps de travail et d’extermination de Treblinka,” in: Jean Guilaïne, Jacques Sémelin (eds.), *Violences de guerre, violences de masse*, La Découverte, Paris 2016, pp. 261–274, which refers to her PhD thesis and the previous paper. Her website announces a paper as “Sturdy Colls, C. 2018 (In Press). Unearthing Treblinka?: Archaeological Investigations at Treblinka Extermination and Labour Camps. In: Vareka, P. and Symonds, J. *Dark Modernities*. Basingstoke: Palgrave Macmillan.” – but that book hasn’t see the light of day yet either.

¹⁴¹ Jan. 23, 2012, 20:00 GMT, BBC Radio 4.

¹⁴² BBC “Treblinka: Revealing the hidden graves of the Holocaust,” *BBC Magazine*, Jan. 23, 2012; www.bbc.com/news/magazine-16657363.

¹⁴³ BBC “Treblinka: Inside Hitler’s Secret Death Camp,” BBC/Furneaux & Edgar Productions, 2013; <https://vimeo.com/120776242>; Smithsonian, “Treblinka: Hitler’s Killing Machine”; www.smithsonian-ianchannel.com/shows/treblinka-hitlers-killing-machine/0/3403868.

The Swedish revisionist scholar Thomas Kues has analyzed these public statements by Ms. Sturdy Colls.¹⁴⁴ If we assume that all the areas where Ms. Sturdy Colls located disturbed soil were indeed mass graves, and if we assume moreover that they all were six meters deep and had vertical walls, they would amount to a total volume of only some 10,800 m³. If we assume an unrealistically high packing density of eight bodies per m³, this would amount to a maximum capacity of 64,800 corpses. If assuming more-realistic values, however, and if considering that some of the objects located are not mass graves, but rather leftovers from the Soviet and Polish digs of 1944/45, the Soviet bombardment prior to that, and from wild digs of locals, then the actual capacity is considerably lower than that.

Juxtapose this with the roughly 700,000 victims which are said to have been buried in that camp prior to any cremations allegedly having occurred. This means that forensic science has so far not even located 10% of the mass grave volume which must have existed, if witness claims are true.

6. Summary

To summarize the most important points of the previous:

1. Eyewitness testimony regarding the location, dimensions and internal structure of the supposed extermination camp Treblinka are utterly inconsistent and contradictory, and virtually impossible to reconcile with actual facts.
2. The alleged killing methods reveal an outlandish imagination. For this reason, all the alleged killing methods other than the Diesel technique have generally been consigned to the Memory Hole.
3. However, Diesel-exhaust gas is not suited to mass murder of human beings.
4. The introduction of exhaust gas from heavy Diesel engines into a hermetically sealed, brick-walled room results in the destruction of the facility in question. The same goes for the removal of the air from such rooms.
5. Given the size of the rooms and the great numbers of victims hermetically locked up in them, as described by the witnesses, death by asphyxiation would have occurred within a relatively short time.
6. The burial pits and cremation sites described would have covered an area far greater than the entire so-called death camp.
7. Empirical knowledge as well as the laws of physics prove that corpses cannot burn by themselves.
8. The quantity of wood required for cremation of the victims would have been so great that there would most definitely be Reichsbahn papers documenting the transports, but no such papers have been found to date. There is also no evidence for the deforestation of large forested areas in the vicinity of Treblinka.
9. The witnesses make no mention of large quantities of fuel or of their transportation to the camp and the cremation sites.
10. Pulverizing more than 35 million pounds of cremation remains with wooden stampers, sheets of metal, and sieves is not a method suitable for the elimination of evidence for human body parts.
11. A minimum of 8,000 Jewish laborers would have been needed to manage all the work involved in the alleged elimination-without-a-trace of the bodies of the Treblinka gas-sing victims.
12. The existence of gigantic quantities of ashes, bones and charred wood could still be conclusively proven even today.
13. An investigation that was ordered by a Polish court and included excavations in Treblinka yielded no proof for the claims of the witnesses. No large mass graves, no gigantic

¹⁴⁴ Thomas Kues, "Comments on Treblinka Statements by Caroline Sturdy Colls," Jan. 27, 2012, <http://codoh.com/library/document/3952>; Mattogno, Graf, *op. cit.* (note 46), pp. 311-324; Carlo Mattogno, Thomas Kues, Jürgen Graf. *The "Extermination Camps" of "Aktion Reinhardt": An Analysis and Refutation of Factitious "Evidence," Deceptions and Flawed Argumentation of the "Holocaust Controversies" Bloggers*, 2nd ed., Castle Hill Publishers, Uckfield 2015, pp. 939-952.

amounts of human ashes, and no signs of large-scale disturbances of the soil as entailed in the creation of mass graves or burning pits were found.

14. It is also proven that after the camp was dismantled the Germans had engaged in no camouflage activities – such as planting lupine or trees, as witnesses have claimed.

According to the December 2, 1941, edition of the official *Amtlicher Anzeiger* of the German occupation forces, Treblinka was to become a labor camp.¹⁴⁵ One might be surprised that the German occupation powers would officially announce the setting-up of the camp, but there simply was not anything secret about labor camps. The Malkinia camp was probably a transit camp for further transport to eastern settlements in Belarus and Ukraine.

In conclusion, it should be stressed once again that disputing (‘denying’) the Holocaust is still a criminal offense in the Federal Republic of Germany. The ‘self-evident nature’ of the Treblinka Holocaust as proclaimed by the courts is based solely on

eyewitness testimony.

In light of the circumstances described here, it is not surprising that by now even the staff of the Holocaust Memorial Site at Jerusalem admit¹⁴⁶ that the heart of the problem with the Treblinka camps is the

eyewitness testimony.

Babi Yar: Critical Questions and Comments

HERBERT TIEDEMANN

“Courage means seeking the truth and proclaiming it!”

Jean Jaurès

1. Preamble

The subject of ‘Babi Yar’ is confusing in many respects. For a general overview, this brief summary shall therefore identify the major problem areas:

1. The mass murder at Babi Yar took place almost four months prior to the Wannsee Conference, where the killing was allegedly first planned.
2. Depending on the source, the number of victims varies by as much as two orders of magnitude.
3. Widely different methods and weapons are alleged for the murders.
4. There is also no consensus on where the killings took place.
5. The witnesses and reports make highly contradictory claims in other respects as well.
6. In some cases, the number of alleged victims by far exceeds the number of Jews remaining in Kiev after the Soviet evacuation.
7. To date there has been no forensic investigation of the murder site and weapons. No attempts were ever made to secure any evidence.
8. It is also odd that the Soviets would use a site as a location for a garbage dump and garbage-incineration site where countless victims were allegedly murdered by the arch-enemy during the ‘Great Patriotic War.’
9. And finally, the allegations are refuted by wartime air photos.

Standard scientific methods will be employed to examine the issues briefly touched on above. Following some introductory information for a better general understanding of the topic, individual sections will present the first reports, eyewitness accounts and other sources, and will discuss specific questions that arise in context. A separate section is devoted to general questions.¹

2. By Way of an Introduction

The conquest of Kiev by German armed forces on September 19, 1941 by no means heralded the end of unrest for this city. Kiev had hardly been occupied when “tremendous explosions occurred one after another.”² On September 24, the Hotel Continental was blown up, along with the headquarters of the rear area of the German 6th Army. On September 25, a conflagration of the downtown area of Kiev, around Khreshchatyk Street, continued to spread. Mines had destroyed almost all public buildings – *after* the German forces had moved in. By the end of September, a Soviet mining map had been found which showed about 50 objects readied for remote-controlled detonation. In addition, an enormous quantity of mines, explosives and ‘Molotov Cocktails’ had also been discovered. Most of the city center had burned down and some 50,000 persons were homeless. Hundreds of German soldiers had been killed fighting the fires. Many organized saboteurs and partisans were left behind in the city abandoned by the Soviets; Kiev was still a battlefield.

¹ For another thoroughly critical study of the alleged mass murder of Babi Yar with even more documents and reports about this event, e.g., an unsigned copy of a document without letterhead, filed in *Bundesarchiv – Militärarchiv*, rev. RH 26-454/28, (strange report of an unknown “*Kriegsverwaltungsrat*” from October 2, 1941), cf. esp. U. Walendy, “Babi Yar – Die Schlucht ‘mit 33.771 ermordeten Juden’?,” in *Historische Tatsachen*, No. 51, Verlag für Volkstum und Zeitgeschichtsforschung, Vlotho 1992.

² General Jodl, on June 4, 1946, in Nuremberg before the International Military Tribunal, *Trial of the Major War Criminals*, IMT, Nuremberg 1947, Vol. XV, p. 329.

According to a document of a rather suspicious origin presented at the International Military Tribunal (IMT), all Jews were allegedly arrested, and 33,771 of them were executed on September 29 and 30 in retaliation for the ‘arson.’ This document does not indicate where this execution took place.³

Prior to the evacuation, about 175,000⁴ but possibly as few as 160,000⁵ Jews lived in Kiev. Yet *Einsatzgruppen* Incident Report No. 106 of October 7, 1941, which gives two different numbers for the Jewish death toll on two different pages (p. 13: 35,000, p. 15: 33,771) but again does not say where the presumed massacre happened, claims about the number of Jews residing in Kiev:⁶

“The number of Jews allegedly amounts to 300,000.”

The Jews were allegedly instructed, by means of posters, to bring their possessions, and gather at a street corner on September 29, 1941. From there, it is said, they would be marched to Babi Yar at the northwestern outskirts of Kiev.⁷

‘Babi Yar’ translates roughly as ‘Ravine of Old Women.’ It is not, however, a ravine, but rather a branching system of erosion channels, from 30 ft. to about 3,000 ft. across and from zero to about 150 ft. depths at the wider sections of the larger western gorges.

The eastern part of this erosion feature was about 1,300 ft. in length and a maximum of 30 ft. in width and extended from the north approaching the Jewish Cemetery lying on its eastern side to about 200 ft. This Cemetery measured roughly 1,300 ft. × 1,000 ft. The broader branch of this erosion feature is located about ¼ mile farther to the west. To the south of the Jewish Cemetery is Melnikova Street, and to the southeast there is a large military camp that already shows up on air photos dating from May 17, 1939.⁸ Not the erosion gully next to the Jewish Cemetery, but the entire extensively fissured area was called Babi Yar. On September 29 and 30, 1941, it is said, countless victims – most of them Jews – were murdered there. But also in this case, no one ever took the trouble of confirming the various allegations and witness statements by means of detailed forensic investigations. An objective analysis is thus required.

3. Press Reports

1. On October 21, 1941, the London office of the Jewish Telegraphic Agency (JTA) reported that the pro-National-Socialist Ukrainian newspaper *Krakiwski Wisti*, published in Krakow, had written

“[...] that soon after the occupation of the city [Kiev], all Jews, including men, women and children of all ages, were taken from their homes and driven into barbed-wire enclosures located at the outskirts of Kiev. From there they were driven by foot to an undisclosed destination.”⁹

- Some 160,000 to 170,000 Jews, but according to *Einsatzgruppen* Incident Report 106 as many as 300,000 Jews, lived in Kiev at the start of the war. The orderly gathering

⁶ *Bundesarchiv* [Federal Archives] Koblenz, R 58/218; J. Mendelsohn (ed.), *The Holocaust*, Garland, New York 1982, Vol. 10, pp. 51ff.; the text of all Incident Reports (*Ereignismeldungen*) and related documents of the *Einsatzgruppen* are printed in: Klaus-Michael Mallmann, Martin Cüppers, Andrej Angrick, Jürgen Matthäus (eds.), *Dokumente der Einsatzgruppen in der Sowjetunion*, 3 Vols., Wissenschaftliche Buchgesellschaft, Darmstadt 2011/2013/2014.

⁷ E. R. Wiehn (ed.), *Die Schoah von Babi Yar*, Hartung-Gorre, Constance 1991, pp. 7f., 84, 86, 137, 141, 143f., 166f., 195f., 477.

⁸ US National Archives, Record Group No. 373, exposure 45.

⁹ The report was written by the leaders of the Central Ukrainian Charitable Committee (Krakow) who arrived in Kiev on Sept. 29, 1941, for their first visit of the ‘liberated’ capital of Ukraine. The leader of this mission was Prof. Kubyiovych, editor of the *Encyclopedia of Ukraine* (cf. note 61). I owe this information to Dr. Myroslaw Dragan, who also provided me a copy of the pertinent article from *Krakiwski Wisti*.

- and transfer of such great numbers of people would have been noticed by countless witnesses, all of whom would have attested to a ‘mass migration’ of people with their possessions. Why are there no such witnesses?
- The report mentions neither a date nor a place. It is claimed that the Jews were driven on foot from barbed-wire enclosures to an unknown destination, but not that they were murdered “at the outskirts of Kiev.”
 - During March 1996 major Ukrainian newspapers reported that Ukrainian American historians determined that the Jews were deported from Babi Yar via the nearby military railroad station to Minsk. During the stay behind barbed wired enclosures, Germans allegedly extracted from the Jews the “customary war tax” in valuables.¹⁰
2. On November 13 the secret broadcasting station of the Polish Underground in Lvov (Lemberg) issued another report¹¹ which was passed on through Warsaw and was received and deciphered in London on November 17 via 819 Selim, a secret Polish receiving station in Istanbul:¹²
- “Germans and Ukrainians are slaughtering Jews by the thousands: in Kiev 35,000 [have been] shot, about 3,000 small children were murdered with clubs by Ukrainians [...]”*
- The tale of the clubbing murders was not publicized by the Polish government-in-exile.
- How could the Jews be shot in Kiev if, according to 1., they had been driven off to an unknown destination?
 - Why is no place or date given despite the importance of the message?
3. On November 16, 1941, the JTA then offered the following cryptic message:¹³
- “Somewhere in Europe [...] from an unimpeachable source that 52,000 men, women and children [...] were mercilessly and systematically executed [...] in accordance with the cold-blooded Nazi policy of extermination [...]”*
- Why was this hair-raising news item squeezed in among rather trivial reports despite the fact that it could have prompted an international outcry?
 - Why, again, are the place and date, as well as further details, not given?
 - Was the Jewish Telegraphic Agency aware of the “cold-blooded Nazi policy of extermination” even before the ‘Nazi’ authorities themselves, who were responsible for the Final Solution and who are said to have been informed about it cursorily only on January 20, 1942, during the ‘Wannsee Conference’?
4. On December 31, 1941, the JTA wrote:¹⁴
- “[...] the latest report from Kiev which reached here today through secret channels gives a horrible picture of what has happened to the Jews in that city since the Nazi occupation. The report reveals that, in addition to executing practically the entire Jewish male population of Kiev on the charge that the Jews who remained in the city were ‘Soviet spies and guerrillas,’ the Nazi military command ordered thousands of Jews confined in mined cemetery grounds. The victims, most of them women, were blown up by the exploding mines. Those who survived were machine-gunned to death by the German soldiers. (Earlier reports estimate that 52,000 Jews were murdered in Kiev when the Nazis first occupied the city.)”*

And in the following paragraph:

¹⁰ Cf. Voldymyr Katylnyckyj in *The Kiev Evening News*, March 16-19, 1996; a few days later this was allegedly reprinted in *For Free Ukraine* (Lviv). On July 10, 1997, the body of Katylnyckyj and his mother were found with multiple stab wounds in their modest apartment. This unchecked information were supplied by Myroslaw Dragan.

¹³ J. Patek, *Memorial Services Commemorating the 50th Anniversary of Babi Yar Could be Attenuated by Aerial Photos Showing Absence of Mass Graves There* (unpublished manuscript).

¹⁴ JTA Daily News Bulletin, Vol. VIII no. 316, Wed., Dec. 31, 1941: “Retreating Nazi Armies Intensify Anti-Jewish Terror in Ukraine,” Jewish Telegraphic Agency, New York.

“[...] the Nazi military forces [...] issued an order in the middle of December requesting all the remaining Jews in Kiev to report to the occupation authorities on a certain date. Aware of the fact that the order meant a new Jewish massacre, many Jewish mothers killed their children and committed suicide, while elderly Jews threw themselves to death by jumping from open windows [...].”

- Did the armed forces commit the atrocities?
 - The men were shot. Where? When?
 - The women were blown up by exploding mines, and in a cemetery. What happened to the children?
 - The latter would have required many tens of thousands of anti-personnel mines, which would then have been unavailable for more important use in the war. It takes a considerable amount of time and work to mine an area. And how were the bodies removed from the mined area afterwards?
 - How does the story of the Jews remaining in Kiev fit in with the other reports?
 - How likely are the infanticides and suicides? Any witnesses?
5. On January 6, 1942, Vyacheslav Molotov, the Soviet People's Commissar for Foreign Affairs, announced to the governments allied with the Soviet Union:¹⁵
- “A large number of Jews, including women and children of all ages, was gathered in the Jewish Cemetery of Kiev. Before they were shot, all were stripped naked and beaten. The first persons selected for shooting were forced to lie face down at the bottom of a ditch and were shot with automatic rifles. Then the Germans threw a little earth on them. The next group of people selected was forced to lie on top of them, and shot, and so on.”*
- It takes many workers and a great deal of time to strip and beat up tens of thousands of people. And how long would it take to force as many people as constitute the entire population of a medium-sized city to lie down in groups at the bottom of a ditch? How many people would it take to shovel a layer of earth over each layer of bodies?
 - In order to shoot people with automatic rifles, one needs at least twice as many bullets as there are people to be shot. 100,000 rifle bullets weigh about 2,820 pounds. Since especially their lead core survives for practically forever, finding them ought to be an easy matter. Why have no investigations ever been conducted? Why do none of Kiev's inhabitants mention the noise of firing?
 - Automatic rifles?
 - About 30,000 m³ (1,060,000 cu.ft.) of soil must be excavated to accommodate 50,000 bodies. When was this excavation done, and by whom? Even given a mass grave depth of 5 m (16.5 ft.), the graves would have taken up an area of more than 6,000 m² (64,500 sq.ft.). What about excavation problems caused by a rocky soil, and what about the resultant time required?
 - Why do the needle-sharp air photos show not even the slightest trace of any disturbances of the ground?¹⁶
 - Molotov's alleged location of the executions contradicts other testimony.
6. The *JTA* report of March 15, 1942:¹⁷
- “240,000 Jews executed by Gestapo in Ukraine”*
- and
- “burying Jewish victims at one great tract of land, near Kiev, by Germans even before life left them [...] ground moving in waves.”*
- Patek also comments on this:¹⁸

¹⁵ V. M. Molotov, *The Molotov Notes on Nazi Atrocities*, The American Council on Soviet Relations, New York Jan. 6, 1942, p. 14.

¹⁶ G. Rudolf (ed.), *Air-Photo Evidence*, 6th ed. Castle Hill Publishers, Uckfield 2020, pp. 154-156; cf. John Ball's contribution, this volume.

¹⁷ Jewish Telegraphic Agency, *Daily News Bulletin*, March 15, 1942, p. 1, JDC Representative Reports.

¹⁸ J. Patek, *op. cit.* (note 13); cf. E. R. Wiehn, *op. cit.* (note 7), p. 102.

“S. Bertrand Jacobson, chief representative of the American Jewish Joint Distribution Committee, [...] quoted one Hungarian soldier declaring that [at] one great tract of land, near Kiev, the Ukrainian capital, he saw the ground move in waves. The Germans, he said, had just conducted mass executions of Jews and had buried their victims even before life had left them.”

- Place?
 - Date?
 - Murder weapons?
 - How can a ground move in waves?
 - Were spectators admitted – Hungarian soldiers, for example?
7. On July 20, 1942, the *Podziemna Obsługa Prasy Pozagettowej*, the Warsaw Ghetto’s underground press agency, claimed:¹⁹
- “Not a single Jew is left in Kiev because Germans have thrown the entire Jewish population in Kiev into the river Dnjepr.”*
- Was there not one among all those tens of thousands who could swim? This killing method would have endangered the troops’ own water supply, while also causing a very considerable danger of epidemic – a nightmare for any troop commander.
 - The bodies would have drifted downstream and been noticed by countless witnesses. Why are there no such witnesses?
8. On October 28, 1942, the JTA reported:²⁰
- “[...] killing the Jewish victims by Germans on the site of the former Zaitsev’s brick factory in Kiev, followed by carting and dumping of bodies into the Dnjepr river.”*
- Another version of the murder and the murder site!
 - How were they killed?
 - Why are there no witnesses?
9. The same issue adds yet another variant on the murder:²⁰
- “[...] 32 Jewish orphans in the woods who were lined up and then the Nazis deliberately drove their tanks over these children, crushing all of them, and compelled the accompanying 118 non-Jewish orphans to bury them.”*
- Did the German armed forces have nothing more pressing to do than to engage in murderous tank maneuvers in the woods? The German tanks of that time were not very well motorized and quite slow, and poorly suited for use in the woods and for such a task. Their tracks were only about 12 inches wide, while the ground clearance was large, approximately 18 inches. Close-range visibility out of tanks was very poor.
 - Where are the witnesses from among the 118 non-Jewish orphans?
 - How credible is it that the murderers would let 118 witnesses (children!) watch?
10. W. H. Lawrence reported from Kiev:²¹
- “50,000 Kiev Jews Reported Killed.”*
- Instead of specifics regarding the place, date, murder weapons and further evidence, the *New York Times* wrote:
- “The evidence remaining is sparse.”*
11. On the evening of February 28, 1944, Radio Moscow reported about German atrocities in Kiev. They came up with another method of murder:²²
- “More than 195,000 Soviet citizens were tortured to death, shot, or poisoned in murder vans by the Germans during the occupation of Kiev.”*
- Date?

¹⁹ “Kijow,” in *Podziemna Obsługa Prasy Pozagettowej*; cf. Archives of the Jewish Historical Institute in Warsaw, Ringelblum-I file, p. no. illegible, July 18, 1942.

²⁰ JTA Daily News Bulletin, “Systematic Execution of Jews in Nazi-Occupied Russia Reported by Partisans,” by JTA from Kujbishev; JTA New York edition, Oct. 28, 1942, p. 3.

²¹ H. W. Lawrence, “50,000 Kiev Jews Reported Killed,” *New York Times*, Nov. 29, 1943, p. 3.

²² J. Patek, *op. cit.* (note 13), p. 9.

- Place?
- The number of victims has grown to almost 200,000, which would make it even easier to secure evidence. Why was this not done?
- ‘Gas vans’ are a very questionable killing method and are absent in later sources.^{4f.}

4. Eyewitness Accounts

1. In November 1943, a certain “Aloshin” told W. H. Lawrence, reporter for the *New York Times*:^{21,23}

“[...] German troops [...] ordered them into the ravine, where they were directed to give up their valuables. Part of their clothing also was removed. Then [...] they were placed on a platform, machine-gunned and thrown into the ravine.”

- So now it was the *Wehrmacht* who were the killers. Does this fit in with the other reports, for example the ‘Incident reports’?²⁴
- How were the clothing and the valuables removed from the ravine?
- Mass murder on a platform? Why? And if so, then it would have been possible for groups at most, not all at once. When was the platform built, and by whom?
- In a narrow, winding ravine, the line-ups of people to be executed cannot be very long. One cannot simply swing the machine gun/s in any large angle without endangering one’s own people, without losing accuracy and penetration at oblique angles, and without facilitating the escape of some of the victims.
- The bodies must be removed as the groups are executed, otherwise they would result in an enormous pile. If one allows ten minutes for the undressing, shooting and removal of the bodies from each group of at most 100 people, then the murder would have taken at least 83 hours.
- How is it possible to lead the victims into the ravine and then throw them into that same ravine after shooting them?
- In late September, dusk comes relatively early in Kiev. On September 29, it rained heavily, all the roads were soggy; on the 30th, it rained and snowed, and road conditions deteriorated even more.²⁵ Since it is impossible to execute groups of any appreciable size in the dark, the murder could have been carried out only during the daylight hours, *i.e.*, it would have taken more than a week. Bright floodlights are not an option in wartime, especially near the front – and with partisans in the vicinity. And Wiehn²⁶ raves about beautiful September days!

2. Vilkis, a Jew born in Odessa, reports:^{13,27}

“[...] a near-by Jewish cemetery, where marble grave markers were removed and brought to Babi Yar, where they formed crude stoves [...] but [the bodies] did not burn well because of lack of draft.”

Vilkis goes on to claim that the Germans sent prisoners into the cemetery to get the iron rails from the graves (?), which were then used to construct cremation grates. During the

²³ World Jewish Congress *et al.* (eds.), *The Black Book*, Duell, Sloan & Pearce, New York 1946 (repub. by Nexus Press, N.Y. 1981), p. 360. The Literature Commission of the Soviet Anti-Fascist Committees, chaired by Ilya Ehrenburg, brought various eyewitness accounts into circulation between 1944 and 1980. These statements were incorporated into various “Black Books” published in the U.S., the Soviet Union, Romania and Israel. For example, Gutman, *op. cit.* (note 5, Vol. 1, p. 135), refers to *The Black Book of Soviet Jewry*, Holocaust Publications, New York 1981, by Ehrenburg and Grossman, which is also on occasion referred to as having been published by a “Holocaust Library”, and 1980 is also given as a year of publication (although all editions carry the same ISBN number). The book was distributed by Schocken Books. The above-mentioned 1946 edition, although based on Grossman’s and Ehrenburg’s material, does not mention them. In 2003, a new edition based on Grossman’s and Ehrenburg’s original manuscript was published: I. Ehrenburg, V. Grossman (eds.), *The Complete Black Book of Russian Jewry*, Transaction Publishers, New Brunswick, N.J., 2003.

²⁴ For a more detailed critique of all event reports referring to this alleged massacre, cf. U. Walendy, *op. cit.* (note 1), pp. 22–32.

²⁵ U. Walendy, *ibid.*, p. 30.

²⁶ E. R. Wiehn, *op. cit.* (note 7), p. 20.

²⁷ *The Black Book*, *op. cit.* (note 23), p. 361.

cremation, the Germans had also brought other victims in murder vans in which they had been asphyxiated. These too, he contends, were cremated.

- People and transportation are required to move marble grave markers. Where are the witnesses? Why has no one ever searched for these grave stones as evidence?
 - How many of these gravestone grates would have to be constructed in order to incinerate that many bodies in such a crude manner? Would it even work at all?
 - Where did the enormous quantities of fuel come from? Based on findings from India – the only country where bodies are cremated in the manner under discussion here – we note: To achieve a marginally adequate, but nevertheless still only partial cremation, 200,000 bodies would require at least 51 million pounds of firewood – a pile 3 ft. high, 3 ft. wide and 34 miles long. Who cut this firewood, and where? How was this huge quantity transported? Who carried the countless bodies to the cremation site? Who removed the remains? Where are the witnesses from among this veritable army of laborers?
 - The claim that cremation gratings were constructed from graveside rails is even less credible; when loaded, these gratings would have collapsed almost immediately due to the heat.
3. The unnamed son-in-law of one Chaim Shapiro, who had been taken to Babi Yar, recounted:¹³
- “At the cemetery the Jews were forced to undress. Fifty six thousand (56,000) Jews were slaughtered. Those who did not die instantly were buried alive. [...] on the tenth day [after the shooting] we were driven to Lukianova [Babi Yar] ravine. We stood there panic-stricken. From beneath the freshly strewn earth streamed rivers of blood, the blood of 56,000 murdered Jews. It cried to us from under the earth. My hair turned gray that morning.”*
- From where does Chaim Shapiro’s son-in-law get his information? What is his name, anyhow?
 - Why was he not among the victims? After all, wasn’t everyone allegedly killed?
 - What was the date?
 - Where is the murder site?
 - Why is the place where the victims undressed not the same as the other witnesses claim?
 - What would a forensic doctor say about the rivers of blood allegedly streaming from bodies killed ten days earlier? The part about the blood crying from the earth is from the Bible; in Genesis 4:10 we read:
- “The voice of thy brother’s blood crieth unto me from the ground.”*
- Can hair spontaneously turn gray?
 - Were Jews forcibly driven to the site of the mass murder in order to produce witnesses?
4. In E. R. Wiehn’s book, L. Levitas²⁸ tells of a certain Riva Kogut, who was later known as Raissa Genrichovna Dashkevich:
- “Early on September 29 the Kiev Jews walked in a continuous line in the direction of Syretz to the train station [...] First the documents were taken away and [...] thrown onto a pile, at the next point the luggage was taken away, [...] already on the grounds of the Jewish cemetery, the people were forced with clubs to undress and were then driven to the ravine. That was the ravine of Babi Yar. Then the people were driven [...] down the slope of the ravine. [...] where narrow, terrace-like places had already been prepared. [...] From the opposite side came the thunder of machine guns. There, [...] hundreds of Jews were shot. [...] Everything happened so fast, [...] blows [...] dog bites [...]. The people lost their minds, many turned gray with horror. [...] A severe chill and the pain in my head forced me to move; I began to climb up. [...]”*
- To the train station?

²⁸ E. R. Wiehn, *op. cit.* (note 7), pp. 252f.

- Beaten up on the cemetery grounds?
 - Narrow terraces had been prepared? By whom? When, in the brief time since the taking of Kiev?
 - Gunned down with machine guns from across the ravine?
 - Dog bites?
 - Multiple graying of the hair?
 - Hundreds of victims – not tens or even hundreds of thousands?
5. Dimitri Orlow, one of the alleged witnesses quoted in a 1980 *Black Book* from the ‘Holocaust Library,’²⁹ testified:

“An entire office operation with desks had been set up in an open area. The crowd waiting at the barriers erected by the Germans at the end of the street could not see the desks. Thirty to forty persons at a time were separated from the crowd and led under armed guard for ‘registration.’ Documents and valuables were taken away. The documents were immediately thrown onto the ground, and witnesses have testified that the square was covered with a thick layer of discarded papers, torn passports, and union identification cards. Then Germans forced everyone to strip naked: girls, women, children, old men. [...] Their clothing was gathered up and carefully folded. Rings were ripped from the fingers of the naked men and women, and these doomed people were forced to stand at the edge of a deep ravine, where the executioners shot them at pointblank range. The bodies fell over the cliff, and small children were thrown in alive. Many went insane when they reached the place of execution.”

Orlow allegedly saw all of this in the space of a few minutes, from the grounds of a cable factory.³⁰

- Date?
- Where was the office operation set up?
- How much personnel and time would the various operations require?
- Soviet citizens did not carry passports!
- Corroborating witnesses???
- Even if the people at the barriers could not see the desks, they would not have failed to hear the gunfire. Why was there no attempt at escape, especially after dark? The rugged, fissured region was ideal for that.
- At this point, an important general note. More than half of the alleged route taken to the execution site ran through built-up urban areas. Why did Stalin’s thugs fail to locate decent witnesses even in this area? Why are there also no witnesses or reports from the *Wehrmacht*? Vacationers, for example, would hardly have kept such horrible events to themselves.
- We learn that groups of thirty to forty persons at a time were led off under armed guard. How much time would this alone take?
- Children and girls? According to Jewish and Soviet sources, almost everyone except for the elderly had been evacuated in time (for example, cf. the sources quoted by Sanning³¹).
- It would take a very long time to carefully remove and fold the clothing of such great numbers of people.
- So here the victims are standing at the edge of a deep ravine, in other words not *in* the ravine. Do people who were exposed to such an awful situation forget in only a very few years where the victims stood?
- The bullets that missed their targets still flew a long way! What measures were taken to ensure that German units were not accidentally shot in the process? One of the military camps, for example, was only about a fifth of a mile away from the execution site.

²⁹ I. Ehrenburg, V. Grossman (eds.), *The Black Book*, Holocaust Library, New York 1980, p. 9; cf. J. Patek, *op. cit.* (note 13) as well as E. R. Wiehn, *op. cit.* (note 7), p. 147.

³⁰ Cf. E.R. Wiehn, *ibid.*

³¹ W. N. Sanning, *The Dissolution of Eastern European Jewry*, Institute for Historical Review, Torrance, California 1983, Chapters 2 and 4.

- The size of the pile of bodies soon would have become problematic. The executed victims must be moved off. Imagine, if you will, how long it would take two persons to extract one body from the bloody pile (which does not offer a very stable surface to stand on), to move it many dozens of yards on average, to deposit it and then to return to the pile of corpses. The place had to be cleared prior to new executions, and then to be manned. Added to this is the bringing-in of the earth and the covering of the mass graves with that earth. Why are there no witnesses for any of this either? Why do the air photos not show any traces of all this?
 - Small children were thrown in alive. Were they sorted out first? Or did the executioners shoot past them? Was the shooting interrupted for this horrible activity?
 - Where was the cable factory from where Orlow was able to observe all this in a few minutes?
6. According to Orlow,¹³ other witnesses said that Germans “dashed the little ones against the rock.” Anyone who reads the Bible attentively will find that Holocaust tales are nothing new to the Jews (Genesis 6, Genesis 19:24, Exodus 11, Joshua 6, Matthew 2:16). Furthermore, pious people in particular draw inspiration from scripture. Psalms 137:9:
“Happy shall he be, that taketh and dasheth thy little ones against the stones.”
7. Tamara Mikhasev:^{7,13,32}
“[...] a young Russian woman whose Jewish husband was a Commander in the Red Army [...] left the place of execution with an ethnic German who was married to a Jewish woman. [...] This Russified German picked up the boy [his son] again, kissed his eyes and said farewell to his wife and mother-in-law.”
- So, a young Russian woman and an ethnic German were admitted as spectators at the execution site to witness the top-secret mass execution of the Jews?
 - Mikhasev embellishes her story with the barking of many dogs, and with dance melodies blaring from loudspeakers to drown out the screams of the victims.³³
8. The Jewess Nesya Elgort tells us:^{7,13,34}
“With her little son [she] miraculously escaped [...] untouched by the bullets [...] [from] under a heap of warm bloody bodies [...] hundreds and thousands of bodies piled on top of each other. [...] It is now difficult for me to understand how I got out of that ravine of death, but I crawled out, driven by an instinct for self-preservation.”
- Neither Nesya Elgort nor her little son was hit by a bullet! How did she manage to crawl out – with her child! – from beneath an enormous pile of bodies? Even with optimum positioning – which is more than unlikely, given the circumstances – the bodies ultimately would have weighted down the thoraces of mother and son to the point where breathing became impossible. One must also ask whether she or the child would not have been harmed by the impact of a body falling down on them, even from as little as 6 to 10 ft. above?
 - She escaped unnoticed from the ravine. Were there no guards?
 - Why were only women able to escape, but not a single one of the men, who in this case would have been physically better qualified?
9. The Jewess Yelena Borodansky-Knysh arrived at Babi Yar^{7,13,35}
“[...] [when] it was already dark. [...] They took our clothing [...] and led us about fifty meters away, where they took our documents, money, rings, ear-rings. They wanted to remove the gold teeth of one old man, and he tried to resist. [...] At about midnight the command was given in German for us to line up. [...] A second later bodies started falling on me. [...] We were sandwiched between bodies.

³² I. Ehrenburg, V. Grossman (eds.), *op. cit.* (note 29), pp. 3, 8.

³³ E.R. Wiehn, *op. cit.* (note 7), p. 148.

³⁴ I. Ehrenburg, V. Grossman (eds.), *op. cit.* (note 29), pp. 8f.

³⁵ *Ibid.*, pp. 9f.

[...] A German soldier was checking with a bayonet to make sure no one was still alive. By chance he was standing on me, so the bayonet blew passed me.

[...] I freed myself, got up, and took my unconscious daughter in my arms. I walked along ravines. [...] Crawling over ravines, I made my way to the village of Babi Yar."

She also provides this sideline story from the place of horror:³⁶

"I'll never forget one girl, Sara; she was about fifteen years old. I can't describe how beautiful she was. Her mother was [...] killed with a rifle butt [...]. Five or six Germans stripped [the girl] naked, but I didn't see what happened after that. I didn't see."

- Why did this witness arrive at Babi Yar only after it had gotten dark? On what day, anyway?
- Many witnesses would have noticed the great crowd of victims-to-be between the time of their morning gathering at the street corner and their much later arrival at the undressing-place. Where are all these witnesses?
- The Jews allegedly had to report on the morning of September 29. But the murder took place not only on the 29th, but on September 30 as well. Wiehn³⁷ even claims that "the death march lasted three days and three nights." Where did the tens of thousands spend the night (or nights)?
- According to this version, the victims were first stripped naked and then, about 50 meters away, relieved of documents, money and jewelry. Was the procedure changed every other minute?!
- Why has no other witness mentioned that the victims' teeth were checked? How much time would that have taken?
- Did the Kiev Jews understand orders given in German?
- How can the German soldier have stood on Yelena Knysh if she was covered by bodies? How much time would it take to climb over mountains of bodies in order to kill anyone still living with a bayonet? Were victims not buried alive after all?
- During World War II, German units did not have any bayonets.
- Where exactly is the village of Babi Yar???
- How likely is the story of the girl Sara's forcible stripping by five or six Germans at once, perhaps even within the range of machine gun scatter?

10. One single eyewitness was permitted (or ordered) by the Soviets to testify abroad. In 1968, Dina Pronicheva testified in Darmstadt in the trial of 11 members of *Einsatzkommando* 4a. The case files are inaccessible to independent researchers! Philip Shabecoff, reporter for the *New York Times*, wrote:³⁸

"When the shooting stopped, the walls of the ravine were dynamited and the rubble was shoveled over the bodies of the men, women and children who lay in it. Some were still alive when buried."

What A. Kuznetsov learned from Pronicheva and incorporated into his novel *Babi Yar*³⁹ does not agree with other testimony, for example:

"[...] machine-gunning of the Jews by German soldiers across the width of the Babi Yar Ravine throughout the night, half in darkness, illuminated by a small bonfire."

But the matter becomes even more confusing when one reads Dina Pronicheva's account in Wiehn's opus.⁴⁰ Significant differences in her recorded statement at the Darmstadt Trial are added in parentheses, with the note S:

"On September 28, 1941, an order from the German authorities was posted throughout the city [...] about 8 o'clock in the morning [S: at 8 o'clock] near Dyakhtyarevskaya and Melnik Streets [S: Dyakhterovskaya and Melnikov][...] my parents and my sister went to the gathering place [...] [S: It was very hot.] I accompanied them and then

³⁶ E.R. Wiehn, *op. cit.* (note 7), p. 149.

³⁷ *Ibid.*, p. 146.

³⁸ "At Babi Yar Trial only Four Spectators," by Philip Shabecoff reporting from Darmstadt, *The New York Times*, Feb. 14, 1968, p. 11.

³⁹ A.V. Kuznetsov, *Babi Yar*, Farrar, Straus & Giroux, New York 1970, p. 109.

⁴⁰ E.R. Wiehn, *op. cit.* (note 7), pp. 175ff.; cf. also P. Longerich (ed.), *Die Ermordung der europäischen Juden. Eine umfassende Dokumentation des Holocaust 1941-1945*, Piper, Munich 1989, pp. 124-127.

intended to return to my family [...] Large groups of people. [...] They were accompanied by Ukrainians, Russians, and citizens of other nationalities. [...] The streets [...] leading to the cemetery area were totally overcrowded with people. As we approached the gathering place, we noticed the encirclement by German soldiers and officers [...] policemen, too. [S: Tank riders.] [S: We went up a hill:] [...] led us in groups of about 40-50 into a so-called 'Corridor' about 10 ft. wide which was formed by Germans standing close together on either side, with sticks, rubber truncheons and dogs [...]. Everyone was brutally beaten by the Germans. [S: Many fell down and were trampled to a thin pulp.] [At] the place at the end of the 'Corridor' [...] policemen stripped them [...] down to their underwear. [S: stark naked.] The beaten and stripped people were taken in groups to the ravine of Babi Yar [...]. They led us to a ledge over the ravine and began to shoot us with submachine guns. [S: machine guns.] [S: entirely different version: a German soldier offered her freedom in return for sex. She claimed to be a Russian, proved it by means of an employment book and union card, was then sent up a hill and not driven into the ravine with others until evening, on the orders of a German officer.] [...] when it was my turn I threw myself into the ravine alive [S: jumped into the pit.] [...]. Here, too, Germans and policemen went around and shot or beat to death anyone who was still alive [...]. One of the policemen or Germans turned me over with his foot, [...] stepped on my hand and my breast [S: he beat me] [...]. Then they began to [...] cover the bodies with soil and sand. [S: I remained lying under the soil.] I couldn't breathe anymore, freed myself of the earth with one hand [S: my right hand, on which the soldier stood, gave me trouble] and crawled to the edge of the ravine [...]. On the second day I saw the Germans chase an old woman and a boy of about 5 or 6 years, who had fled from the ravine. The old woman was shot, they stabbed the boy with a knife. About 30 ft. away from this spot seven Germans came along, leading two young girls. They raped them there and then stabbed them to death."

- Re. Shabecoff's report in the *New York Times*: who drilled the blast holes, where did the equipment come from, and why are there once again no witnesses to this considerable amount of work? Why is no trace of any of this visible on the air photos?
- Re. Kuznetsov: they shot across the ravine at night? Wouldn't that endanger even their own people?

Re. what Wiehn⁷ saw fit to publish, and re. Pronicheva's testimony in Darmstadt, I have the following questions:

- About 8 o'clock or at 8 o'clock?
- Incorrect street names from a Kiev resident?
- Why is her 'weather report' entirely wrong?
- How can one return to one's family when they had just been led away?
- How and where were the Ukrainians, Russians and citizens of other (which?) nationalities separated from the doomed?
- Where is the hill?
- Why did all the other witnesses forget the 'Beating Corridor'?
- What are Tank riders?
- Stripped down to their underwear, or stark naked?
- Employment book and union card retained even though she was stark naked?
- Trampled to a thin pulp?
- Ledge over the ravine?
- Ravine or pit?
- A hill?
- Submachine guns or machine guns?
- Has anyone ever tried to turn, with his foot, a person wedged between other bodies?
- The soldier beat a girl he presumed was dead?
- What presence of mind a girl must have, not to shriek or to react in some other way when someone steps on her hand and breast, or even beats her?

- Why did no one notice that she freed herself? Not even the soldier standing on her right hand?
 - How daring must a girl be, to still observe events near the site of the crime two days later – and how insensitive to the cold, considering that she is either in her underwear or entirely naked?
 - How likely is the tale of the proposition and of the girls who were first raped and then stabbed? Sexual intercourse with Jews was considered defilement of the blood, and was forbidden.
 - Why did she understand German in Babi Yar, but not a word of that language in Darmstadt?
 - Might her job – actress in a puppet theater – explain her facility at confabulation?
11. Ernst Klee, Willi Dreßen and V. Rieß⁴¹ have culled the testimonies of three witnesses – Höfer, Kurt Werner and Anton Heidborn – from the files held at the Central Office in Ludwigsburg; these files are not, however, made available to independent researchers.
- According to Höfer, the Jews had to undress and neatly stack their clothes at a spot 500 ft. from the ravine (according to Werner it was a kilometer, about $\frac{2}{3}$ of a mile). Then the naked victims were led into a ravine which according to Höfer was 500 ft. long, 100 ft. wide and 50 ft. deep, whereas Werner claims it was 1,300 ft. long, 260 ft. wide at the top and 33 ft. wide at the bottom, and 33 ft. deep. According to Höfer, two or three narrow passages led into the ravine; according to Werner, the victims were led to the edge of the hollow and then ran down the slopes of their own accord.
- Höfer maintains that there was only one marksman at each end of the ravine; Werner tells of a total of twelve. Höfer testified that a “packer” stood at each end and placed each victim onto the previous bodies. Then each was shot by a member of the police with a bullet from a submachine gun in the neck. The children were shot together with their mothers. Werner reported, however, that the Jews had to “lie down facing the earth up against the walls of the hollow” and were then murdered via a bullet in the neck. The next victims then had to lie down on top of the bodies.
- Three days after the execution, they began covering the heaps of corpses with earth. According to Heidborn, a hand was seen waving from among the bodies three days later.
- Time required, given two “packers” and marksmen, or twelve marksmen?
 - How does the position of the victims, up against the wall of the ravine, agree with the picture shown by Wiehn where “exhumed bodies” are shown lying flat?⁴²
 - Why are critical researchers not allowed access to documents, and not only in Ludwigsburg?
 - Why does not even public prosecutor Willi Dreßen take exception to the contradictions, to say nothing of the physical impossibilities alleged?
 - Why do the authors make no mention of the 300,000 Jews postulated for Kiev in Incident Report 106, and mention only the 150,000 from Incident Report 97 of September 28, 1941?⁴³
 - Why did even Gerald Reitlinger⁴⁴ marvel how it was possible to keep that many people together on the road for two whole days, but Klee and his co-authors don’t notice this problem?
12. Adalbert Rückerl’s anonymous witness would seem to be Werner, from the previous scenario. The witness reported:^{45,46}

⁴³ E. Klee *et al.*, *op. cit.* (note 41), p. 67.

⁴⁴ G. Reitlinger, *The Final Solution*, A. S. Barnes & Co. Inc., New York 1961, p. 263.

⁴⁵ A. Rückerl, *NS-Verbrechen vor Gericht, Versuch einer Vergangenheitsbewältigung*, C. F. Müller, Heidelberg 1984, pp. 43-45.

⁴⁶ A. Rückerl (ed.), *NS-Prozesse nach 25 Jahren Strafverfolgung: Möglichkeiten – Grenzen – Ergebnisse*, C. F. Müller, Karlsruhe 1972, pp. 86f.

“[...] shot [...] the entire Jewish population of Kiev. [...] Executions [...] until five or six o'clock. [...] All were naked.”

In the second publication⁴⁶ we find that Rückerl draws on Incident Report 106³ unmodified. He quotes the blocking-off of the execution place, the filling-in of the pits after the execution, as well as a few individual Soviet citizens who had secretly witnessed the execution. He suggests that neutral witnesses were only rarely available, and that their testimony was generally not suited to convicting the defendants. As an example, he quotes the statement of the witness N. T. Gorbacheva from Kiev:⁴⁷

“[...] I lived in Kiev, at 55 Tiraspol's-Kaja Street, Door 2. [...] near the place called Babi Yar. On September 22, 1941, I saw with my own eyes [...] how, in the course of the day, about 40 trucks drove to Babi Yar, loaded with Jewish residents. [...] I and some other women [...] went, unnoticed by the German guards, to the place where [...] the people were being unloaded. We saw that about 50 ft. from the beginning of the Babi Yar the Germans forced the Jews to undress and ordered them to run along the Babi Yar. Then the Germans shot at the running people with submachine guns and machine guns. [...] There were not only people who had been shot, but also injured people and even living children in the ravine. Nevertheless, the Germans filled the ravine in; the thin layer of soil moved visibly.”

The only things Rückerl contests are the date and the use of trucks for all the victims. He accepts it for those who could not walk. Rückerl withholds the fact that Gorbacheva claimed:⁴⁸

“The shooting of the Jews went on for several days.”

- According to the unnamed witness⁴⁵ 6 o'clock was ‘closing time.’ So, all those who tell of murders at night must have lied?
- Is Rückerl so unfamiliar with the Soviets’ Babel of Propaganda and Lies that he considers a book printed in Moscow in 1963 to be a reliable document?
- Was he able to find a ‘Tiraspol'skaja Street’ (that’s how it would be written correctly!) on a street map of Kiev, and near the ‘place’ Babi Yar (which is not a ‘place’ at all)?
- How many people – along with their possessions – can 40 trucks carry?
- Does Rückerl really believe that some of the ladies of Kiev were so insane, so utterly fearless or so curious that they would sneak past the guards posted by the evil enemy, and then watch the mass murder?
- Is there ‘the Babi Yar’ that has a beginning and which one can run along?
- Are executions carried out by shooting at running targets with various kinds of firearms?
- How does the “thin layer of soil” agree with the great quantities of earth needed to fill in a ravine?
- Would anyone who had not been hit by a bullet not suffocate directly after being buried alive?

13. In Babi Yar in March 1942, Adalbert Hartl, Gestapo Expert for Church Matters, observed:⁴⁹

“small explosions that shot up clods of earth. It was the spring thaw that was letting the gas from the thousands of bodies escape.”

What is a Gestapo Expert for Church Matters doing at Babi Yar? The small explosions and rocketing clods of earth are nonsense, for even when wet ground freezes solid it is never gas-proof – especially not sandy soil.

⁴⁹ *Ibid.*, p. 138.

5. Other Sources

1. A physician named Dr. Gustav Wilhelm Schübbe allegedly killed 21,000 persons single-handedly, with morphine injections. 110,000 to 140,000 victims were allegedly killed in this way at the “German Annihilation Institute” in Kiev.^{50,51}
 - Injections of morphine, which was in very short supply and badly needed for wounded soldiers?
 - And how long would it take one physician to give 21,000 injections?
 - According to the files of the US Document Center in Berlin, which holds more than a million records pertaining to members of the NSDAP (‘Nazi’ Party), Dr. Gustav Wilhelm Schübbe was never stationed in Kiev.
 - Why did neither the USSR nor the Jews ever search for the location of this “Annihilation Institute”?
2. After the liberation of Kiev, Moscow newspapers and the *New York Times* reported that 40,000 (!) inhabitants of Kiev had written to Joseph Stalin and given the number of victims of Babi Yar as more than 100,000.⁵²
 - When, where and how did these people die?
 - What happened to all these ‘witnesses’?
3. In 1963, Nikita Khrushchev sharply criticized the literary champions of “Jewish martyrdom,” especially Yevgeny Yevtushenko, who had drawn notice the year before with his poem *Babi Yar*:⁵³

“I urge Comrade Yevtushenko and other young literati to appreciate the trust of the majority [of the people], not to seek cheap sensationalism [and] not to pander to the mood and tastes of the Philistines. Do not be ashamed, Comrade Yevtushenko, to admit your mistakes. [...] When the enemies of our Cause begin to praise you for pleasing tales, then the people will criticize you, and rightly so.”

The cause for Khrushchev’s reference to “pleasing tales” was Yevtushenko’s readings of his poem *Babi Yar*. Khrushchev’s blunt words weigh very heavily, for several reasons:

 - Would Khrushchev have used the term “cheap sensationalism” if the hated enemy from the ‘Great Patriotic War’ had in fact murdered thousands of Soviet citizens at Babi Yar? Would he then have cautioned Yevtushenko against “pander[ing] to the mood and the tastes of the Philistines”? Would Khrushchev then have admonished against “pleasing tales”?
 - On June 24, 1941, in his capacity as Head of the Soviet Communist Party and General Secretary of the Ukrainian Communist Party, Khrushchev ordered the liquidation of the political prisoners in Lvov (Lemberg). The NKVD then began with the mass murders in the prisons of Lemberg and other places in the western Ukraine. The Soviets also laid the blame for these massacres at the Germans’ door. Khrushchev knew exactly who had done the murdering and who it was who had suffered!
 - Furthermore, Khrushchev, a Ukrainian, knew very well that the minorities predominating in the economy and in industry, research, teaching and politics in the Ukraine – in other words, the Greater Russians and especially the Jews – had been given priority in the evacuation. He knew the evacuation rates of the Jews, for example Minsk

⁵⁰ “German Doctor Admits Killing 21,000 Himself,” *The New York Herald Tribune*, May 1, 1945; this article does not mention Babi Yar specifically.

⁵¹ “Murder of 140,000 Upheld by Germany,” *The New York Times*, May 1, 1945.

⁵² “Kiev Lists More Victims, Letter to Stalin Says 100,000 Were Massacred by Nazis,” telegram from Moscow to the *New York Times*, *The New York Times*, Dec. 4, 1943.

⁵³ N. S. Khrushchev, *Pravda*, March 8, 1963.

94%, Šitomir 88%, Novograd-Volynskij 90%, Poltava 96%, Černigov 97%, Zdanov 100%, and Taganrog 100%. For Vinnitsa, Kiev and Uman it was about 80%:⁵⁴⁻⁵⁸

*“In Kiev practically the entire Jewish youth had left the city with the Red Army. Only older people remained.”*⁵⁴

– Wiehn, for example, ought also to have noticed that, for on his p. 146 we read:³⁷

“Sarrah Evenson’s advanced age had made her evacuation from Kiev impossible.”

– Since Wiehn must also have read the information he quoted from Reitlinger⁵⁹ regarding evacuation rates, one cannot help but suspect a deliberate attempt to falsify history and even to commit academic fraud. Incidentally, a few pages further one finds yet another and even more time-consuming and extremely dubious murder method. Reitlinger:⁶⁰

“[...] that the victims were shot in the neck at the precise moment when they stepped from a board into the cave.”

– A cave???

– At the 20th Party Convention of the Soviet Communist Party in February 1956, Khrushchev succeeded Stalin and accused him of organized mass murder.

– Yevtushenko got the inspiration for his poem *Babi Yar* from the American Jew Joseph Schechtman; it was not his own experiences he described with such a flaming pen.

4. In its entry “Babi Yar” the *Encyclopaedia Judaica* (Jerusalem, 1972) devotes 92% of its entry space (21.65 inches of text) to Yevtushenko’s poem, but only 8% (1.8 inches of text) for an account of the massacre.¹³ The encyclopedia claims that 100,000 died in Babi Yar, 33,771 of them in the last days of September.

– Could the *Encyclopaedia Judaica* not come up with any better evidence than a poem?

5. The *Encyclopedia of Ukraine*, published in Toronto in 1988, states that only 3,000 Jews were executed in September, and gives their total number as “more than 150,000.”⁶¹

6. The *Encyclopedia of the Holocaust* (New York, 1990) alleges a wide range of things, which for reasons of space I present in table form:⁵

ENCYCLOPEDIA OF THE HOLOCAUST:	CRITICAL COMMENTS:
Not until after the war did it turn out that the blasting in Kiev had been carried out by units of the NKVD which had remained behind.	The information regarding the blasting is false. (Cf. introductory information and General Jodl, in note 2.)
On September 26 the Germans decided to kill all the Kiev Jews as retaliatory measure.	Where is some conclusive evidence for such a German decision of September 26?
SS- <i>Standartenführer</i> Blobel attended this meeting.	How does this claim agree with the fact that Blobel was off duty at the time, due to his head injury of September 24? ⁶²
On September 28 [1941] placards were posted, ordering that the Jews had to gather at the corner of Melnik and Dekhtyarev Streets at 8 o’clock on the morning of September 29, to be resettled.	There is no evidence whatsoever for a placard produced by the printing unit of the 6th Army.

⁶⁰ *Ibid.*, p. 137.

⁶¹ *Encyclopedia of Ukraine*, University of Toronto Press, Toronto 1988, Vol. 1, p. 154.

⁶² U. Walendy, op. cit. (note 1), pp. 29, 37.

ENCYCLOPEDIA OF THE HOLOCAUST:	CRITICAL COMMENTS:
The text of the placards was written by Propaganda Division No. 637, and the placards had been printed by the printing unit of the 6th Army.	The Propaganda Division and the printing unit of the 6th Army could be forgiven for mistakes in the Russian and Ukrainian texts, but why are there grammatical errors in the German text as well? And why is no issuing authority mentioned on the placards?
An area including the Jewish Cemetery and part of the ravine was fenced in with barbed wire and guarded by a special commando of police, Waffen SS and Ukrainian police.	What/who is the source for the information that the Jewish Cemetery and part of the ravine were fenced in with barbed wire? Waffen SS? Ukrainian policemen?
Outside the ravine the Jews had to hand over their valuables, to undress entirely, and then to go to the upper edge of the ravine in groups of 10.	Groups of 10 would mean 3,377 groups. Even allowing only 5 minutes per group, this would still take 281 hours, or 24 days when working 12 hours a day.
On reaching the edge they were shot with automatic weapons (German edition: with machine guns). At the end of the day the bodies were covered with a thin layer of soil.	Extra time needed for removing the piles of bodies and for covering with soil?
In the following months, thousands more Jews were captured and shot in Babi Yar.	If some 80% of the approximately 160,000 Jews – <i>i.e.</i> , 128,000 – had been evacuated, then how could 33,771 be murdered on September 29 and 30 and thousands more in the following months? Where did the enormous number of bullets and cartridges go?
Some of the Kiev inhabitants helped the Jews disappear.	
But the Ukrainians of Kiev denounced Jews in such numbers that the short-staffed SIPO and Security Service could not process all the letters that arrived by the bucketfull. ³⁹	
According to Soviet researches, 100,000 people were murdered in Babi Yar, including Gypsies and Soviet prisoners-of-war.	What documents are there to prove the total of 100,000? Doesn't the claim that in Babi Yar also prisoners-of-war are buried make Khrushchev's criticism of Stalin even more significant?
As of mid-August 1943 the graves were opened with bulldozers, but the bodies were transported by fettered inmates, among them 100 Jews.	Did the Germans have bulldozers? Is this sort of equipment used in a narrow ravine? Do the air photos give any indication of such activities? Why bulldozers, if the main part of the work had to be done by slaves in chains? Where did the 100 Jews come from?
The bodies were burned on a base of railroad tracks and on pyres of tree trunks, for which purpose they were doused with gasoline.	Where did the enormous quantities of railroad tracks and firewood come from, especially in view of the advancing Soviet front? Whence the gasoline, which was not even in adequate supply for tanks and the Luftwaffe?
The bones were crushed on gravestones from the Jewish Cemetery.	Gravestones for crushing bones? Evidence?
The cremation lasted from August 18 to September 19, 1943.	
The ashes were screened and sifted in order to retrieve all of the gold and silver.	How long would it take to screen and sift all the ashes, along with everything that had become mixed with them?

<i>ENCYCLOPEDIA OF THE HOLOCAUST:</i>	CRITICAL COMMENTS:
	Whither did the gravestones and the ashes go?
After the bodies were cremated, 15 prisoners escaped.	
Jews were not mentioned as victims in the inscription on the memorial erected in 1974. Modified in 1991, the inscription now also commemorates the Jews (German edition).	Why did the first inscription withhold the information that there were Jews among the victims?

About two weeks after the recapture of Kiev in late 1943, the western journalists who had been invited²¹ were told that six weeks earlier the Germans had finished the blasting, exhumation and open-air incineration of 70,000 bodies, the crushing of the unburned bones and the bulldozing of the material into the ravine.

- What happened to the difference of 30,000 bodies, and where are all the witnesses for these blazing fires, for the clouds of smoke and the infernal stench?
- It ought to have been an easy matter for the Soviets to procure evidence and witnesses to prove all these claims to the journalists – or perhaps not?
- Why did the physical evidence fail to impress the journalists?

7. On the fiftieth anniversary (1991) of the German ‘attack’ on the Soviet Union, the ZDF (2nd German State TV Channel) broadcast a film series by Guido Knopp, who had produced it in collaboration with *Gostelradio*, a Soviet state undertaking which even then was probably still controlled by the KGB. In the course of this broadcast series, Babi Yar was also discussed (June 18, 1991).

A woman named Sheila Polishchuk recounted roughly the same as set out above in Section 4 Part 9. Her mother had thrown herself and her child, Sheila, into the ravine. Mother and daughter were covered up by more and ever more bodies. The mother had pushed her fists under her daughter’s neck so she would not drown in the blood. A soldier allegedly stood on her mother and thus missed her with the bayonet. The mother managed to work her way out from under this mountain of corpses, taking her unconscious daughter with her.

A ‘ravine’ was shown, which looked more like a 30-ft.-deep and 65 to 100-ft.-wide gravel pit. Another picture, taken at an angle from behind, showed a row of fully dressed (!) persons at the edge of a pit, with their backs to the pit.

A film of an ‘interrogation’ from Stalin’s days was shown; the interrogatee admitted having shot 120 persons. Six men had been assigned as guards and six as execution commando. He claimed to have shot about 120 people in a period of 36 hours.

- Given the killing rate admitted to by the interrogatee, it would have taken about 10,131 hours to manage the 33,771 executions claimed in the ZDF broadcast.
- How did Sheila Polishchuk’s mother manage to turn herself and her daughter around 180 degrees and to throw herself head over heels into the ravine without either of them sustaining bruises or broken bones and without either of them crying out? If the mother had to keep the child from drowning in the blood, then the daughter must have lain practically at the bottom of the ravine, *i.e.*, she and her mother were among the first victims. So, the piles of corpses lying on both of them must have been an enormous weight.
- If mother and daughter were underneath many bodies, how could the soldier stand on the mother?
- If the soldier stood on the mother – in other words, if the other part of the story is not true – then why did his bayonet not strike mother or daughter after he had changed his position?
- If the mother could work her way out from under a mountain of corpses, then she would have had to move other bodies around in order to free her daughter. After all, the bodies were not lying there neat and orderly, they were quite entangled! Why did the guards not notice her activity?

And for the sake of a bit of variety, other sources also tell of escaped mothers. Jean-François Steiner's book⁶³ is based on many instances of alleged eyewitness testimony and claims that "Ivan," who was later promoted to "the Terrible," was killed during the Treblinka revolt (which claim, however, was rescinded during Demjanjuk's first trial). This book tells of a very similar case which allegedly took place at about the same time, in Ponar near Vilna. Driven into a corner, Steiner admitted that his book was really just a novel (but the *Brockhaus Enzyklopädie* quotes it as factual source in its article on Treblinka!). Kuznetsov's book³⁹ and *Schindler's List*⁶⁴ are also works of fiction!

Other questions regarding Knopp's film:

- Despite all the top secrecy, who managed to take a photo of the victims lined up to be shot, and this from a clearly visible vantage point and even potentially within the scatter field of the machine gun fire?
- Why does the rather out-of-focus picture reveal characteristics common to many other falsified propaganda pictures?
- Why are the people dressed?
- According to the witness, six men were designated as execution commando and six as guards. Where did the 'bayonet men' come from?
- How many prisoners or groups can be guarded by six men?

8. Novelist Guido Knopp writes in the left-hand column of page 132 of his book:⁶⁵

"[...] many soldiers stood with machine guns. [...] They led us to a ravine, where boxes stood, in which they collected the documents and other things. [...] Then an execution commando took up position. Mother did not wait for the commando; she threw herself and me into the pit and fell on me. The special units began to cover us over with dead bodies. After that they shot another group. [...] a soldier stood on my mother and stabbed the wounded man lying beside her. When they passed on to share the spoils, mother pulled me out unconscious and carried me away."

In the right-hand column of the same page, however, we read:

"When they arrived at the ravine after the beating, they had to lie down on the ground in rows, in small groups. Then the execution commando went into action. A burst of machine gun fire, a few shovels of earth that only barely covered the bodies, and then the next group was driven into the ravine."

- How does Knopp imagine the machine gun execution of victims that are lying down?
- And what must one think of authors who, when writing the right column of a page, can no longer remember what is written in the left column?
- For comparison, we have the sworn statement of Professor Aloschin (cf. 4.1.), according to whom heavy machine guns were set up on either side of the ravine. And:

"then Russian prisoners-of-war who were stationed on either side of the ravine with shovels [...] had to throw sand over the victims."

- The victims had been herded into the ravine; the heavy machine guns were fired downward at a sharp angle – not an easy task.
- At the bottom, he said, the bodies piled up every which way – not, as Knopp describes, "in rows on the ground." From experience with the mass graves in Hamburg, for the 40,000 victims of the British terrorist attacks, we know that the prisoners-of-war would have had to shovel about 742,000 cu.ft. of sand in order to cover the victims. Given a more careful layering of the bodies, as in Katyn, there would still have been about 503,200 cu.ft. to shovel. Since the bodies were in the pit, they would either have had to dig into the embankments or to bring the sand in from outside. More work, and lots of it! Do the air photos reveal any of this? How much sand can one worker shovel per day, under such conditions?

⁶³ J.-F. Steiner, *Treblinka, la révolte d'un camp d'extermination*, Fayard, Paris 1966, pp. 17ff.; German ed.: *Treblinka: Die Revolte eines Vernichtungslagers*, Stalling, Oldenburg 1966, pp. 338f.

⁶⁴ Regarding *Schindler's List* cf. the contribution of Udo Walendy in this volume.

⁶⁵ G. Knopp, *Der verdammte Krieg: Unternehmen Barbarossa*, Bertelsmann, Munich 1991, p. 132.

- Where does Knopp glean his knowledge of large empty halls in which those still living spent the night?⁶⁵ There were no halls at Babi Yar. And why is there not so much as one single witness for these treks – from the murder sites to the ‘halls’ and back the next morning?
- 9. Professor Dr. Wolfgang Benz:⁶⁶ In the ravine
 - “[...] *there were 3 groups of marksmen, a total of about 12 marksmen. [...] They stood behind the Jews and killed them with shots to the neck.*”
 - Shooting in the neck was the well-known murder method of choice for the GPU, NKVD, KGB, and Stasi!
- 10. On February 18, 1946, the Soviet prosecutor Smirnov declared at the IMT:⁶⁷
 - “*In Kiev, over 195,000 Soviet citizens were tortured to death, shot, and poisoned in the gas vans, as follows:*
(1) In Baybe-yar, over 100,000 men, women, children, and old people.”
 - How does this version agree with the various eyewitness testimony?
 - Did the Communist regime concoct these claims in order to blame its own mass murders on the Germans? The approximately 10,000 Ukrainians who were murdered in Vinnitsa by the Soviets via bullets to the neck and then thrown into mass graves⁶⁸ come to mind, as do other massacres.
- 11. N. F. Petrenko and N. T. Gorbacheva testified:⁶⁹
 - “[...] *the Germans threw babies at the breast into graves and buried them alive with their dead or wounded parents.*”⁷⁰
 - Evidence? Specifics re. place, date, etc.?
- 12. In C. Clarke’s book we read:⁷¹
 - “*German tanks roared through the large Jewish quarter, after the occupation, blasting every living object in sight, and then burning Jews alive in flaming buildings and killing them in woods over the mass graves excavated by the victims while some Jews were tied to trees and shot or bayoneted.*”
 - Evidence? Witnesses?
 - Wouldn’t blasting living creatures with tanks and setting a sector of the city ablaze in order to burn people in the buildings have run the risk of setting the entire city ablaze – that the Germans just barely managed to save from the Soviet-caused blaze?
 - Time required for the victims-to-be to excavate the mass graves?
 - Place? Date?
 - Why the time-consuming procedure of tying to trees?
 - If there was a large Jewish quarter, why were the Jews not simply ordered to gather there and led off, instead of marching them in many columns into northwestern Kiev and producing many witnesses in the process – witnesses who, however, mysteriously were not to be found later?
- 13. In her book, published in 1987 in Israel, Leni Yahil wrote:⁷²
 - “*The 30,000 Jews who assembled [in Kiev] were taken to the forest and slaughtered over the course of two days.*”
 - Leni Yahil does not name witnesses, nor does she give an explanation and/or evidence for how it was possible to assemble and lead off more than 30,000 people within a few

⁶⁹ N. F. Petrenko, N. T. Gorbacheva, eyewitness testimony, Document USSR-9, *IMT*, Vol. VII, p. 541.

⁷⁰ See also A. Rückerl, *op. cit.* (note 46), pp. 86f.

⁷¹ C. Clarke, *Eichmann: The Man and His Crimes*, Ballantine Books, New York 1960, p. 62.

⁷² L. Yahil, *The Holocaust*, Oxford University Press, New York 1990, p. 257; first pub. in Israel.

hours, without thousands of people noticing and potentially appearing as witnesses later.

- Yahil transfers the murder site to a forest. So, it wasn't a ravine? Evidence? Air photos?

14. As noted in Section 6, the Jews of Kiev and its environs were presumably informed via placards that they had to assemble with all their belongings at a specific place. This placard was not ready until the day before.

This organizational point is of utmost importance and should be examined a little more closely, for the relevant considerations apply *mutatis mutandis* for all the various versions of the massacre.

The placard was printed in Russian, Ukrainian and German and allegedly read [translation of German text]:⁷

“All the Jews of Kiev are to gather until 8 o'clock on Monday, September 29, 1941, at the corner of Melnik and Dokteriwski Streets (at the cemeteries). Bring your papers, money and valuables, also warm clothing etc.

Anyone failing to comply with this order, and found elsewhere, will be shot.

Anyone breaking into vacant Jewish homes or appropriating items from the same will be shot.”

Fundamental questions:

- Why is no issuing authority given?
- Name and rank of the issuing commander?
- Date of issue?

Regarding the German text:

- 8 o'clock in the morning or 8 o'clock in the evening? “Until” 8 o'clock?
- The original German text was printed using ‘oe,’ ‘ae’ and ‘ss’ instead of ‘ö,’ ‘ä’ and ‘ß.’ Did the printer for the 6th Army not have any umlauts in his fonts?
- “Dokteriwski Street” is incorrect. The street was called ‘Djegtjariwskoi,’ i.e., Tarburner Street.
- “Melnik Street” is incorrect. It is correctly called ‘Melnikova Street.’ It is named for a Mr. Melnikov.
- “*An den Friedhöfen*” (the original German wording for “at the cemeteries”) is incorrect German. It should read ‘Bei den Friedhöfen.’ Aside from that, the Russian text has only *one* cemetery.
- The *Encyclopedia of the Holocaust*⁵ claims that the purpose of the order was ‘resettlement.’ What is the source of this insight? The placard makes no mention of this.
- What is meant by “found elsewhere”? When people converge on a location from everywhere else, everywhere is “elsewhere.”
- How likely is it that a military propaganda division and an army printer would do such sloppy work?

Regarding the Russian text:

- The term used for Jews (“*shidy*”) is contemptuous Russian gutter jargon. What sort of results can one expect when even the order to assemble bodes ill? Did the Germans actually want to run the risk of having a large part of the Jews not show up at all, and go into hiding instead? Perhaps they even intended that in such a case they would put all armed conflict on hold, and employ their forces in locating the Jews instead...?
- Here, too, the street names are incorrect. Moreover, the declension of street and that of cemetery are both wrong.
- The Russian text specifies 8:00 a.m. No mention is made of resettlement!
- In the list of things to bring, what does “etc.” mean? Did that not risk having the great Jewish population come to the gathering place loaded down with masses of baggage and horses and wagons, hand carts and baby buggies crammed full of belongings, blocking all the streets of Kiev in the process?

Regarding the Ukrainian text:

- Again, incorrect street names, and no hint as to the purpose of the assembly.

Whoever may have been responsible for this ‘order’ – what were they thinking of:

- after the occupation of Kiev, and with an anonymous placard, with name-calling and threats of execution, to order perhaps 100,000 or even more Jews to assemble literally over night and with potentially all their belongings, at a single street corner at 8 o’clock the next morning?
- How was this ‘message’ supposed to reach the Jews in Kiev and its environs, shortly after the extremely destructive armed conflict?
- How did they intend to handle this enormous and unorganized crowd (no staggered times for the summoned, in alphabetical order, for example)? Did they deliberately risk chaos in the streets – something which the occupiers of a large, partisan-riddled city precisely did *not* need?
- How are these great masses of people and goods to fit at one street corner?
- How does one print approximately 2,000 placards in a city with no electrical power?
- Where and how does one post the placards, while potentially risking one’s life to snipers?
- Why did none of the many German Army privates notice the huge crowds, the miles-long exodus, or the placards (which, after all, they could read!) and mention all of this at an appropriate time, if only to their families?
- Why did none of the foreign correspondents, whom the ‘German gangs of killers’ allowed to view the captured and burning city of Kiev, see or at least hear about even a single one of the alleged 2,000 placards?
- In a just recently captured and still very dangerous city, is there nothing more pressing for the occupiers to do than to create additional problems on an enormous scale, especially in contexts which, after all, were not terribly urgent?

Wiehn⁷³ and others seem not to have noticed that there were several rather different versions of the placard. According to Reitlinger,⁷³ the placard specified “within three days,” and “for resettlement.” According to L. Ozerow,⁷⁴ the placard was in Ukrainian and Russian and stated “7 o’clock.” Arch-Stalinist Ilya Ehrenburg claims 7 o’clock,⁷⁵ and his street names are also wrong. A. Kuznetsov⁷⁶ also has no idea of the correct street names, and gives neither the Ukrainian nor the German text. Incident Report No. 128 of November 3, 1941, allegedly announced the resettlement via “wall posting.”⁷⁷ The term “wall posting,” which is quite unusual in the German language, appears to be a common usage for Russians.⁷⁸

15. On October 6, 1991, on the occasion of a night-time commemoration at Babi Yar, a middle-aged orthodox Jew stated on Ukrainian Television in Kiev:⁷⁹

“150,000 Jews were massacred by the Germans in two days, with the active participation of a minority of Ukrainians from Kiev and the passive cooperation of the majority.”

- Where does he get his figure of 150,000 murdered?
16. Vladimir Posner, an American-born Jewish NKVD collaborator, claimed that 200,000 were murdered.⁸⁰ Evidence?
 17. On April 23, 1990, Vitaly Korotych, a Ukrainian NKVD and KGB collaborator, claimed that there had been 300,000 victims at Babi Yar.⁸¹
 - How did Korotych come up with this figure?

⁷³ Wiehn, *op. cit.* (note 7), p. 137.

⁷⁴ *Ibid.*, p. 143.

⁷⁵ *Ibid.*, p. 167.

⁷⁶ *Ibid.*, p. 195; placard source: Central State Archives of the October Revolution, Registry, 65th ed. Chr. 5., Moscow.

⁷⁷ Wiehn, *op. cit.* (note 7), p. 477.

⁷⁸ Deutsch-russisches Wörterbuch, *Sowjetische Enzyklopädie*, Moscow 1971, p. 577.

⁷⁹ Ukrainian television, Kiev, Oct. 6, 1991.

⁸¹ V. Korotych, Lecture in Toronto, Canada, at the Canadian Institute of Internal Affairs, April 23, 1990.

18. On September 5, 1991, *The Washington Times* published the claim of Genadi Udowenko, the Ukrainian Ambassador to the United States, who alleged that 50,000 Jews, most of them children, had been butchered during the first week of the dreadful massacre of Babi Yar.⁸²
 - Did he perhaps get this information from I. M. Levitas, the Head of the Society for Jewish Culture in Kiev, who had made the same claim in an interview with a Kiev newspaper?⁸³ That would mean that despicable Jewish parents had abandoned more than 25,000 children when they were evacuated by the Soviets. This, however, is refuted by Jewish and Soviet publications,^{31,54-58} which stressed the evacuation of *families* in order to sustain morale.
19. In her book, the Kiev author and poet Dokia Humenna, who had witnessed the entire time of occupation in Kiev, devotes fully half a sentence to the alleged massacre of Babi Yar.⁸⁴ She describes it as a rumor, and states that the alleged killing methods were machine gun executions, electric shock, hand grenades, and burying injured Jews alive.
 - Why does this contemporaneous witness deem Babi Yar worth only half a sentence?
 - Why does she consider it a rumor?
 - What is the source for the new murder methods of electric shock and hand grenades?
20. Readers of the *Great Soviet Encyclopedia* of 1950 will search in vain for an entry for Babi Yar.⁸⁵ The 1970 edition claims 50,000 to 70,000 victims.⁸⁶
 - Isn't it surprising that the mighty encyclopedia of 1950 forgot about Babi Yar, even though Smirnov and his coworkers had testified to the most gruesome things about it only a few years earlier in Nuremberg?
21. The 1955 and 1971 editions of the Ukrainian encyclopedias are unaware of Babi Yar.^{87,88}
22. The following important encyclopedias do not mention (are not aware of) Babi Yar:
 - *Grand Larousse Encyclopédique*, Paris, 1960;⁸⁹
 - *Brockhaus*, 1967;⁹⁰
 - *Enciclopedia Europea*, Rome, 1976;⁹¹
 - *Enciclopedia Universal Nautea*, Madrid, 1977;⁹²
 - *Encyclopedia Britannica*, 1945 to 1984 editions;⁹³
 - *Academic American Encyclopedia*, 1991;⁹⁴

The 1987 edition of the *Brockhaus Enzyklopädie* has already heard of Babi Yar.⁹⁵ According to this work, more than 30,000 Jews were murdered by members of a German police battalion in a ravine in northern Kiev. Yevtushenko's poem and Shostakovich's 13th symphony are cited, but a reader will search in vain for better data. The *Brockhaus Enzyklopädie*'s discovery is probably the result of its collaboration with *Meyers Enzyklopädisches Lexikon*.⁹⁶ The latter contains similar information, as well as a reference

- to A. V. Kuznetsov's documentary novel. The Babi Yar points of the compass are given incorrectly in both encyclopedias.
23. In his book,⁹⁷ the Jew J. G. Burg (actually Joseph Ginzburg), who – along with his family – experienced the deportation in the East first-hand, reports that after the Red Army had retreated from the area of Czernovych the local population carried out numerous pogroms against the Jews, and that it took severe intervention by Germany and her allied troops to put a stop to these pogroms.
- Why does Burg not mention any similar mass murders committed by the Germans?
24. On page 78 of Johannes Heer's and Klaus Naumann's book *Verbrechen der Wehrmacht 1941-1944*, Pictures 1 and 2 allegedly show, "The victims on their way to Babi Yar" on a bright, sunny day.⁹⁸
- According to the *Kriegstagebuch des OKW, Raum Kiew*, from Sept. 29 and 30, 1941, the weather was rainy, the roads muddy.
 - The road visible in the picture is dry.
 - Some people in that picture are walking in the opposite direction.
 - Not masses of people (33,000!) are walking in this picture, but only a few.
 - There are no guards visible, even though they certainly would have been necessary if the alleged victims could hear the machine guns firing in the background.
 - The people shown do not carry any belongings, although they allegedly were told to do so.
 - In reality, the road allegedly shown runs from the southeast to the northwest. Thus, according to the shadows, the sun is shining from the west at an angle of some 50°. This is impossible for Kiev during the end of September!
 - The Hessian Main State Archives, referred to by Heer and Naumann as having provided this picture, wrote on April 15, 1997:⁹⁹
- "It is not known here, where the assignation to Babi Yar stems from."
25. And last but not least: at the memorial ceremony in Babi Yar in October 1991, the President of the *Bundestag* (German Parliament), Professor Dr. Rita Süßmuth, accused the Germans of the murder as follows:
- "Fifty years ago, 33,771 Jews were murdered here in the course of two days, and at least as many again in the following two years; countless other persons shared the same fate later. By the end of the German occupation of the Ukraine, the ravine had become a mass grave."
- From where did she get her figures?
 - Does this academic feel that she is above the scientific maxim of *de omnibus dubitandum est* (everything is to be doubted)?
 - How many persons does the good professor consider "countless"?
 - Did this President of the *Bundestag* not swear an oath of office to avert harm from the German people?

6. Fundamental Questions

6.1. Regarding the Number of Victims

The 'precise' figure of 33,771 murdered Jews stems from Incident Report 106 of October 7, 1941.³ In the following, we shall just briefly show why even the very few figures given in Incident Report 106 prove that what we have here are clumsy fabrications. Other evidence for the fabrication has been provided by Walendy,²⁴ among others.

One must assume that the destruction of the Jews was led by German experts. Wiehn emphasizes that the *Einsatzkommandos* were headed by intellectuals (note 7, p. 17). But it is an unforgivable mistake for experts to claim that there were about 300,000 Jews in Kiev,

⁹⁷ J. G. Burg, *Schuld und Schicksal*, 2nd ed., Castle Hill Publishers, Uckfield 2018, p. 40.

⁹⁸ Johannes Heer, Klaus Naumann (ed.), *Verbrechen der Wehrmacht 1941-1944*, Hamburger Edition, Hamburg 1995.

⁹⁹ Letter of the Hessische Hauptstaatsarchiv of April 15, 1997, to the author.

especially two-and-a-half weeks after that city had been occupied, by which time there would have been a relatively reliable overview of the situation.

140,256 Jews lived in Kiev in 1928-1931.¹⁰⁰ It was a known fact that prior to the Second World War the Jewish population of the Ukraine had dropped by about one-third due to emigration to the less anti-Semitic northern and eastern regions of the Soviet Union;¹⁰¹ this rate was a little lower for Kiev due to the urbanization of the Jews. And it was also a known fact that the population of Kiev had shrunk from some 850,000 – 930,000 persons to about 305,000 due to evacuations.^{102,103} So if there had still been 300,000 Jews in Kiev on about October 7, then these ‘experts’ would have found practically no one in Kiev who was *not* Jewish – and it would not have taken experts to notice that.

Thus the “non-Jewish population of Kiev” which Incident Report 106 mentions as expecting the German authorities to take retaliatory measures due to the arson perpetrated by the Jews, would have consisted almost entirely of ghosts. And the *Encyclopedia of the Holocaust*,⁵ too, would have been conjuring up ghosts in speaking of non-Jewish parts of the Kiev population who helped the Jews to hide, or who wrote denunciatory letters by the bucket-load.

The literature^{31,54-58} shows that fewer than 40,000 Jews, most primarily the elderly, remained in Kiev by the time the German forces arrived.

Reitlinger states that in early 1946, at a time when the great remigration of deportees and evacuees from Siberia had only just begun, there were already 100,000 Jews in Kiev again.¹⁰⁴ In 1959 there were 154,000.¹⁰⁵ Wiehn states that in 1959 15% of the inhabitants of Kiev, *i.e.*, about 166,500, reported Yiddish as their mother tongue.¹⁰⁶ In addition to this, there was a significant unreported number of Jews, for the Russian census did not check the information regarding religion or ethnic origin, and many Russian Jews preferred, and continue to prefer, to conceal their ethnicity. Furthermore, many were left out of the group at issue due to mixed marriages. One can thus safely assume that at least as many Jews lived in Kiev in 1959 as had lived there in 1939. And finally, it is beyond dispute that a great many Jews died in the camps in Siberia, and that the birth rate of the Jews was also noticeably below average.

What would an unbiased court do when the numbers of alleged victims in a crime under investigation diverge this drastically?

6.2. Regarding the Time of the Murder

According to the *Brockhaus Enzyklopädie*¹⁰⁷ the “order for the final solution of the Jewish question” was issued on July 31, 1941 (Nuremberg Trial Document NG 2586e), and was announced on the occasion of the ‘Wannsee Conference’ (January 20, 1942).¹⁰⁸

Quite aside from the fact that historians and other interested persons are still searching in vain for this order for mass extermination, it is more than odd that many tens of thousands would have been slaughtered in Babi Yar before the order was even made known. Therefore, let us take a closer look at the relevant documentation.

In the January 26, 1942, letter from the Chief of the Security Police and the Security Service (Heydrich) to Under Secretary of State Martin Luther in the German Foreign Office, we read:¹⁰⁹

¹⁰⁶ E.R. Wiehn, *op. cit.* (note 7), p. 112.

¹⁰⁷ *Brockhaus Enzyklopädie*, *op. cit.* (note 90), Vol. 9, p. 514.

¹⁰⁸ Cf. Roland Bohlinger, Johannes P. Ney, *Zur Frage der Echtheit des Wannsee-Protokolls*, 2nd ed., Verlag für ganzheitliche Forschung und Kultur, Viöl 1992, 1994; Roland Bohlinger (ed.), *Die Stellungnahme der Leitung der Gedenkstätte Haus der Wannsee-Konferenz zu dem von Bohlinger und Ney verfaßten Gutachten zur Frage der Echtheit des sogenannten Wannsee-Protokolls und der dazugehörigen Schriftstücke*, Verlag für ganzheitliche Forschung, Viöl 1995.

¹⁰⁹ See the reproduction of the document on the website of the Memorial *Haus der Wannsee-Konferenz*:

“Now that the fundamental line to be taken with regard to the practical final solution of the Jewish question has been determined and the authorities involved are in complete agreement, I would ask you [...]”

and farther down:

“[...] to assign your official in charge of completing the outline requested by the Reich Marshal, in which the organizational, factual and material prerequisites for the practical implementation of the tasks involved in the solution are to be identified, to the required discussions of specific details. I intend to hold the first discussion of this kind on March 6, 1942 [...]”

In other words, considerations of all the organizational, factual and material prerequisites for a practical implementation of the tasks involved in the solution were not even begun until about mid-March 1942. Heydrich announced his appointment as delegate for the preparations of the Final Solution. This further confirms my earlier arguments.

Fundamental questions were to be settled. It is a big step from settling fundamental questions to planning details, and another step to implementing detailed plans. Heydrich mentioned retrospectively: “forcing [the Jews] back, speeding up [their] emigration,” and:

*“The goal was to cleanse the German sphere of Jews in a lawful manner. **After prior approval by the Führer, the evacuation of the Jews EASTWARD** has replaced emigration as a further possible solution.”* (Emphasis added.)

How likely are mass murders months before the prior approval of the victims’ evacuation? Part of the purpose of the evacuation was also to gain experience “relating to the coming final solution of the Jewish question.” So, there was not even an overall concept at that time.

To deal with the final solution (which the document shows to be, at this point, evacuation and labor deployment of the Jews), consultations between experts from the Foreign Office, the Security Police and the Security Service are suggested. Again, there is nothing definite.

This gives rise to a pressing question: On whose orders were the “33,771 murders” committed on September 29 and 30, 1941, four months before the Wannsee Conference was convened and easily five months before the disputed Wannsee Conference Protocol copies finally reached the participants? Surely mass murder without backing from higher-up is anything but likely. All the more so, considering that even later on, *i.e.*, after the Wannsee Conference, a good number of concentration camp commandants were convicted by Hitler’s justice system, some of them even executed, for cruelty and other irregularities.¹¹⁰

So, when did the murders really take place?

6.3. Regarding the Site of the Crime

Where was the crime committed?

- In the cemetery, beside the cemetery?
- In a forest and if so, in which one?
- At the edge of the ravine, in the ravine, and in which ravine anyhow?
- In a brickworks?
- In Kiev?
- In gas vans?
- Or perhaps even in the Dnjepr River?

6.4. Regarding the Murder Weapons

What do the sources discussed allege the murder weapons to have been?

- | | | |
|--------------------|-----------------|-----------------------|
| – machine guns | – rocks | – bayonets and knives |
| – submachine guns | – tanks | – burial alive |
| – automatic rifles | – mines | – drowning |
| – rifle butts | – hand grenades | – injections |
| – clubs | – gas vans | – electric shock |

www.ghwk.de/fileadmin/user_upload/pdf-wannsee/begleitschreiben-heydrich-1942.pdf.

¹¹⁰ K. Koch (Buchenwald) and H. Florstedt (Majdanek); cf. A. Rückerl, *op. cit.* (note 46), pp. 126f.

– Did the Germans avail themselves of the Soviet method of shooting victims in the neck? What would an unbiased court do if it had to pass judgment on an alleged mass murderer, if the witnesses were in such thorough disagreement?

6.5. Logistic and Organizational Questions

Shooting 33,771 or even far more people within two days and then removing all traces of the deed (which is impossible anyhow, with the investigative means available today!) would require superb organization and logistics. Some aspects thereof were discussed in the context of specific issues, and for reasons of space constraints I will have to leave it at that.

I would stress, however, that these problems would have been unmanageable under extreme conditions such as prevailed right after the taking of Kiev, with fires, detonations and partisan activity on the one hand, and the continuing battles at the front, with their concomitant demand for human and material resources, and in autumn of 1943 in the face of the advancing deadly front of the Soviet army.

6.6. Securing Evidence

Why did no one ever try to secure any evidence in order to prove the murders? By way of contrast, some time ago, following a double murder of policemen, the German police vowed to dig up the entire military training area of Sennelager if necessary to find the bodies.

When the German Federal Bureau of Criminal Investigations got into trouble in the context of the cause of death of a terrorist following the 1993 incident in Bad Kleinen (one terrorist was shot by the police, another arrested), a Minister resigned, a very high-ranking official got his walking papers, the entire track was gone over virtually with a fine-tooth comb, domestic and foreign institutes were commissioned with investigations, the Special Unit involved was interrogated, physical evidence was compared with testimony – practically everything that *could* be done to remove any and all doubts *was* done.

But in the case of Babi Yar, witnesses and allegations (and from Stalin's glorious days, no less!) are blindly given full credence even though they contradict each other and claim the silliest impossibilities.

Why does no one bother to lift a finger in this instance, to secure bodies and remains, residues, murder weapons etc., even though countless victims are at issue? Is such conduct by the responsible authorities in keeping with applicable international legal guidelines?

It is clearly not necessary to specify which questions a high-ranking, disinterested, international and incorruptible committee of experts would have to examine in order to arrive at a relevant forensic assessment!

But the incriminating *documents* must also be examined very critically, not least of all because they, too, are rendered questionable by the evidence contained in the air photos.¹⁶ The so-called Gerstein Report,¹ and the Jerusalem Trial of John Demjanjuk² no less, show that the champions of one particular school of thought do not hesitate to commit grotesque falsifications even many decades after the end of the war. Some few examples:

Despite a clear and unequivocal international report issued after the discovery of the mass graves of Katyn, the atrocity propaganda churned out by Ilya Ehrenburg, Vassili Grossman and their ilk continued – not only throughout the Nuremberg Trials, but right up until a few years ago – to pin the Stalinist mass murders on the Germans.³ In this vein, Katyn and Babi Yar are not the only examples that come to mind; there are also the massacres of Lvov, Kharkov, Bykivnia, Bielhorodka, Darnitza and Vinnitsa. They represent many hundreds of thousands of victims, including some from the liquidation era of Lazar Moisejevich Kaga-

¹ H. Roques, *The "Confessions" of Kurt Gerstein*, Institute for Historical Review, Costa Mesa 1989; C. Mattogno, *Rudolf Reder versus Kurt Gerstein*, 2nd ed., Castle Hill Publishers, Uckfield, 2021; cf. the chapter by F. P. Berg, this volume.

² Cf. the chapter by A. Neumaier, this volume.

³ Cf. Auswärtiges Amt (ed.), *Amtliches Material zum Massenmord von Katyn*, F. Eher, Berlin 1943; George Sanford, *Katyn and the Soviet Massacre of 1940*, Routledge, Oxford 2005.

novich.⁴ Katyn is the only case so far where the Soviets have admitted as late as 1991 that *they* were the perpetrators!

6.7. Babi Yar: From Mass Murder Site to Garbage Dump

After the end of the war the Soviets turned the ravine of Babi Yar into a municipal garbage dump, and later into a garbage incineration site.⁵ That the Soviets intended to build a sports facility over the site of indescribable crimes is no less incomprehensible...⁶

To the best of this author's knowledge, Khrushchev's reprimand to Yevtushenko was never made public in the western world. Did this terse rebuke perhaps reflect the plain and simple truth?

*Just exactly **what** is self-evident about Babi Yar?*

7. Supplement

Dr. Tiedemann's above analysis has its main focus on the claimed events surrounding the alleged mass murder of 33,771 (or 35,000) Jews in or near Kiev in late September 1941. The story's second part – the claimed exhumation and cremation of these victims plus all those who are said to have been murdered later on – deserves just as much attention, if not even more. After all, the air photos available to us from late September of 1943 showing the area of the Babi Yar ravine are most telling about what happened shortly before and while these images were being taken.

In Chapter 4 of the second part of his massive book on the activities of the *Einsatzgruppen* in Russia, Italian scholar Carlo Mattogno has done exactly that.⁷ I shall give here only a brief summary of these results, and refer the interested reader to Mattogno's book for more details.

The basis of the orthodox narrative as to what transpired at Babi Yar in late summer 1943 as the Red Army was approaching Kiev is the summary as given by a German court verdict dealing with this case. According to this, at least 50,000 bodies of killed civilians were exhumed by 327 inmates who performed that work while fettered with heavy chains around their ankles.⁸ The procedure is said to have been as follows:⁹

“After exposing the bodies or their remains, the inmates began to pull them out of the mass graves with special hooks, and to pile them up in gigantic stacks. By their very nature, the pyres were not always exactly the same size; as a rule, however, about 2,000 bodies were burned in a pile several meters high covering a ground area of at least 50 square meters on average. To ensure a complete and thorough combustion, T-bars (rail-road rails) or large steel grates were put onto a stone base, and on top of this, then, wood and the exhumed bodies were stacked in layers. Every pyre was then sufficiently soaked in tar oil and set on fire. It usually burned for more than 24 hours. Subsequently, any bones or other residue left over had to be pulverized by the inmates. The ashes were sifted through in search of precious metals, and finally scattered or buried.”

This story more or less conforms with the very first report about this alleged event as published by a Soviet “Investigation Commission” in early 1944 that in turn relied on a number of eyewitness accounts rather than any physical evidence.¹⁰ The critical assessment of these eyewitness testimonies results in the following:

⁴ Brockhaus Enzyklopädie, *op. cit.* (note 90), 1970, Vol. 9, p. 602; and R. Conquest, *The Harvest of Sorrow*, Oxford University Press, Oxford / New York 1986, p. 328.

1. The Number of Victims

Although the *Einsatzgruppen*'s Incident Reports do not mention any additional mass execution in or around Kiev after late September 1941, orthodox scholars claim, based on witness testimony and Soviet declarations, that many more people were executed after the alleged initial Babi Yar massacre. Total death-toll numbers vary between 40,000 and up to 125,000, but these numbers are based on nothing but disparate and contradictory conjectures.

2. Cremation Techniques

The pyres described by the various witnesses vary wildly in number, shape and dimension. However, most of the witnesses agreed that the pyres were made of gravestones put on the ground, upon which railroad rails were put, which in turn were covered by railings or fence sections, like the gravestones also taken from the nearby Jewish cemetery. On top of this makeshift grate, bodies and wood were piled in alternating layers. The purpose of this useless design is a complete mystery. Had the space beneath the rails been used for firewood, it would have made some sense, but that was not the case. It all was a futile exercise, or rather a figment of the witnesses' imagination.

Several witnesses also agreed on the number of corpses put on each pyre: some 2,000 (although some claimed more than that). If considering the claimed dimension of the pyres and the number of corpses on them, however, it turns out that the volume of these pyres would not have been enough to fill it both with the number of corpses claimed and with sufficient firewood to incinerate them. Furthermore, the shape of the pyres – usually a square of several meters in length and width, stacked up to many meters in height by alternating layers of corpses and wood – would have made it extremely difficult, if not outright impossible, to build them and maintain them while burning.

Experience with mass cremations of livestock cadavers shows that a pyre best consists of one long row of cadavers/corpses lying side by side and atop the fuel wood.¹¹ Hence, any pyre said to have been built by those alleged evil German cremation experts would have been some 2 m wide only. A realistic pyre also most certainly would not have been higher than wide – or else the pyre could have toppled over, spilling burning corpse parts all over the place – and it would have been as long as it needed to be in order to accommodate all corpses. If using fresh wood – which must be assumed in the case at hand – the possible stacking density per running meter of pyre would have amounted to some four to five average human corpses, or eight to ten severely decomposed ones. Hence, accommodating 2,000 decomposed corpses would have resulted in a pyre some 2 m wide and high, and some 200 m long – not the pyres as claimed by witnesses, for instance 8 m × 8 m × 3 m, or 10 m × 5 m × 4 m. If we assume the minimum number of bodies to have been cremated – 40,000 –, then 20 of these pyres would have been needed (or more than 60 for the upper death-toll limit of 125,000 victims).

The entire operation is said to have lasted some six weeks (42 days). It would have taken days for each pyre to completely burn down and cool down, before the remains could have been sifted manually. After all, extinguishing the still-glowing pyre remains with water is neither mentioned by any witness nor could the resulting slush have been sifted with sieves as claimed. Hence, several of these pyres would have been in various stages of operation at once, and the entire area around Babi Yar would have been covered persistently in smoke and stench.

If we use A. Neumaier's data from Chapter 5.3. of his paper in the present book (one laborer could sift through and pulverize the remains of 20 skeletons per day), and that 40 days were available for that work, then 40,000 corpses would result in a workload of 1,000 per day (or 3,125 for the upper death-toll limit), for which 50 workers had to be employed (or 156 for the upper death-toll limit).

Materials, Naukova Dumka Publishers, Kiev 1987, pp. 201f.

¹¹ For details on experiences with outdoor mass cremations of livestock see Heinrich Köchel, "Outdoor Incineration of Livestock Carcasses," *Inconvenient History*, 7(1) (2015); updated in: C. Mattogno, *Auschwitz: Open-Air Incinerations*, 2nd ed., Castle Hill Publishers, Uckfield 2016, pp. 128-140.

3. Wood Requirement

None of the witnesses tells where the firewood had come from. If we assume a need of some 200 kg of fresh wood to cremate one body, this would amount to 8,000 metric tons of fresh wood for 40,000 bodies (or 25,000 tons for 125,000 victims), or 200 metric tons per day (625 tons/day for the upper death-toll limit). If an inmate can process one metric ton of wood a day (fell a tree and saw/chop it up to log-size pieces), then this job alone would have required 200 workers (or 625 for the upper death-toll limit). Add to this the workers needed to load the wood onto trucks, drive them to the cremation site (40 or 125 round trips for a 5-ton truck per day, respectively), and unload the wood there. Add to that the labor force needed to dig out the mass graves, to extract the bodies, and to build the pyres, one for 2,000 corpses every other day (requiring 400 metric tons of wood on a pyre 200 meters long) or more than three every other day for the upper death-toll limit. If considering all this, then we can easily understand why having all this done by merely 327 workers is absolutely delusional.

4. Disappeared Cremation Equipment

After all this is said to have been accomplished, the Jewish cemetery should have been pretty much devoid of any gravestones, railings and fences. Yet no one ever noticed anything to that effect. Also, hundreds of gravestones and fence sections should still be in the ravine today, as even some of the witnesses claimed, but no evidence to this effect has ever been secured.

5. No Knowledge among Partisans and Civilians

Only a few months after the alleged Babi-Yar massacre, “information” reached the world about it. Yet when it comes to the alleged mass cremations of later summer 1943, there is very little information. Although at that time the stench of the exhumed bodies and the smoke of the gargantuan cremations must have blanketed the city for 42 days; the light of the fires must have illuminated the night skies; the many trucks delivering thousands of tons of firewood to the ravine must have roared through Kiev’s road every day – no one noticed. There is not a single report about it, not a single diary entry, not a single photograph, and also no Soviet air photo, although the front was only a few miles away, and both sides were using plenty of aircraft.

Reprisals and Orders from Higher Up

KARL SIEGERT, WITH COMMENTS BY GERMAR RUDOLF

* * *

Introduction

In early 1944 the Allies landed in Italy, a few miles south of Rome. In order to keep the immense cultural treasures of Rome safe from harm, the German Field Marshal Kesselring declared Rome an “open city,” *i.e.*, a battle-free zone. This made Rome the hotbed of all kinds of partisan groups and foreign secret service activities. Since Italy was at that time engaged in a sort of civil war (not all Italians agreed with the ousting of Mussolini and the betrayal of Germany), the situation in Rome, only a few miles behind the battle front, was explosive. These were the conditions under which *Obersturmbannführer* [Lieutenant Colonel] Herbert Kappler of the Security Police was charged with keeping peace and order in the city, a task at which he was indeed largely successful.

On March 23, 1944, however, something happened. On this day, as on many other days before, the police regiment “Bozen,” which was comprised almost entirely of South Tyroleans, marched through the Via Rasella. As the regiment passed by a street-sweeper’s cart, an enormous explosive charge in the cart, mixed with iron shrapnel, blew up. 32 of the ethnic German policemen were killed instantly, another 10 died later of their injuries. 60 policemen were badly wounded.

To prevent an escalation of the partisan warfare in Rome, the *Wehrmacht* Supreme Command reacted to this assassination (which had violated international law) by posting placards announcing that, if the perpetrators did not turn themselves in, 10 civilians would be shot for every policeman that had been killed. Kappler even released captured partisans with the order to inform the assassins in the underground of this announcement and to persuade them to surrender. When no one had given themselves up by March 24, 335 persons were executed in the Ardeatine Caves near Rome; Kappler had assembled this group mostly of prisoners, and of criminals, saboteurs, spies and partisans who had already previously been sentenced to death.

After the war, Kappler was sentenced to lifetime imprisonment for this act, but his subordinates were acquitted.¹ However, some left-wing lobbyists and the public prosecutor also wanted to imprison, for life, one Captain Erich Priebke, who had belonged to Kappler’s unit and had participated in the execution. The Argentinean government had extradited him to Italy in 1996. The Italian military court acquitted Priebke on August 2, 1996, on the grounds that the statute of limitation had been exceeded. At this announcement an irate lynch mob gathered outside the court,² so that the judges ordered Priebke taken into custody again, and decided in early February 1997 that he would have to be retried before a military court.³ This court eventually decided, on July 22, 1997, that Priebke would have to go to prison for five years.⁴ For a short while, criminal investigations for murder were also opened against those

¹ Rudolf Aschenauer, *Der Fall Kappler*, Damm-Verlag, Munich 1968; this work also contains much information on the legality of the execution of hostages, esp. pp. 6-8.

² Two detailed monographs appeared in Italy about the Priebke case: Pierangelo Maurizio, *Via Rasella, cinquant’anni di menzogne* (Via Rasella, Fifty Years of Lies), Maurizio Editore, Rome 1996; Mario Spataro, *Rappresaglia* (Reprisal), edizione Settimo Sigillo, Rome 1996). In Germany the *Deutsche Rechtsschutzzkreis* was the first to publish a brief summary of the case, well worth reading: Günther Stübiger, *Der Priebke-Prozeß in Italien*, Schriftenreihe zur Geschichte und Entwicklung des Rechts im politischen Bereich, Issue 5, Deutscher Rechtsschutzzkreis, Bochum 1996; more detailed: Gernot Gyseke, *Der Fall Priebke*, Verlagsgesellschaft Berg, Berg am Starnberger See 1997.

³ “SS man on trial again for caves massacre,” *The Daily Telegraph*, April 15, 1997, p. 16.

⁴ AP, “Priebke convicted in WWII massacre,” Rome, July 22, 1997. Priebke was sentenced to 14 years’ imprisonment, of which 9 years were amnestied. The co-defendant, Karl Hass, was sentenced to 10 years, of which he served only 8 months in open detention. Meanwhile, Priebke temporarily found refuge in an Italian monastery: Reuter, “Ex-Nazi Priebke rejects Italy court order to move,” Rome, August

partisans who had been responsible for the explosives attack and who were still alive back then,⁵ but the case was eventually shelved, because murder against the former German occupiers is not a crime in Italy. In his appeal, Priebke was even given a life-time sentence, which he had to spend in a residence in Rome under house arrest.⁶

In discussions of the Priebke Case, the point at issue is not so much the details of the case as such as first and foremost the legitimacy of executions of hostages or of reprisals against civilians by a military occupation power. In this context, Dr. jur. Karl Siegert, Professor of law at the University of Göttingen, wrote an expert report shortly after the end of the war, which was introduced as evidence during the trial conducted at that time in Italy against Herbert Kappler.⁷ Since this expert report is of extraordinary importance, we shall reproduce it in the following – leaving out, for reasons of space, the discussions of legitimate requisitions as irrelevant for the issues at hand.⁸ The report is followed by several other examples as well as supplemental explanations pertaining to partisan warfare during the last war, and the German reaction to them.

I. The Legal Sources of International Law and Their Development

Reprisals were not regulated by the Hague Land Warfare Convention of October 18, 1907.⁹ They received first mention in Article 2 Section 3 of the Geneva Agreement of September 27, 1929, about the treatment of prisoners of war. This Agreement prohibited reprisals against prisoners of war. A general prohibition of reprisals against civilians was not issued until August 12, 1949, by the Geneva Convention Relative to the Protection of Civilian Persons in Time of War.¹⁰ Its Article 33 decrees:

“Reprisals against protected persons and their property are prohibited.”

Article 34 supplements this with the order that taking hostages is also prohibited. In the time of the Second World War, therefore, there was a gap in the conventions for the treatment of civilians.

Requisitions are discussed in Article 52 of the Hague Land Warfare Convention of October 18, 1907. In this context, however, developments have since gone beyond the framework of the Convention [...].⁸

There are no international legal agreements concerning *orders from higher up* and their effect on the legitimacy or indictability of the actions of soldiers carrying out a reprisal or

requisition, unless we accept the decrees of the victorious Allies in the London Agreement of August 8, 1945, as international law.

Under these circumstances we must go beyond the framework of the Convention.

The regulations of international law follow from three sources:

1. International treaties
2. International customs as expressions of a general practice that is acknowledged as legal regulation
3. General principles of law

In international and national practice as well as in international jurisprudence these three sources have increasingly found recognition. First and foremost, we would mention Article 38 of the Statute of the International Court of Justice. We would also mention the American Nuremberg verdicts in Cases VII and XI, and refer to the Italians Pallieri, Cavaglieri and Francesco Rocco, the Frenchman Cavaré, the Austrian author Verdroß, the Dane Alf Ross, the Germans Wilhelm Sauer, Ernst Sauer, Drost, Schütze, Schwarzenberger, and others.¹¹ Some authors, such as Anzilotti, Hyde, Guggenheim and Sibert, recognize only two judicial sources of international law, namely treaties and common law.¹² The third source – the general principles of law – is also needed, however, to supplement the treaties and common law.¹³

With the aid of these three judicial sources, we can achieve a reconciliation between the older Continental system characterized by the closed, logical structure of its principles (main advocate, Anzilotti), and the Anglo-American system of jurisprudence guided by practical examples (case law).¹⁴ In this way it is also possible to systematically consider and solve even newer problems of international law which were not yet known to the authors of the older agreements.

This goes first and foremost for the application of the Hague Land Warfare Convention of 1907. At the time of its inception there were as yet only few automobiles, neither armored vehicles nor airplanes, neither carpet-bombing nor nuclear weapons, and also no “total war” where civilians are both actively and passively enlisted for participation. In this context, the problem of partisan warfare has attained a significance that could be in no way foreseen in 1907. As well, the inhabitants of occupied zones, even if they have not actively taken up arms, are subjected to the effects of war in a completely different way than was the case in earlier wars. The Belgian court-martial in Liège has stated that certain regulations of the Hague Land Warfare Convention are entirely outdated.¹⁵ In his study of the development of

the law governing occupation in wartime from 1863 to 1914, the American author Graber¹⁶ wrote in 1949 that it is necessary to examine whether the regulations issued between 1863 and 1914 do in fact still represent the fundamental principles of international law as these pertain to wartime occupation, or whether it is necessary to work out an entirely new law incorporating the new aspects of war-time occupation in present times.

According to the American verdict in Case V, it is necessary to examine the actions of the defendants in relation to the circumstances and conditions of their surroundings:¹⁷

“Sensible and practical guidelines must be applied.”

The aforementioned American verdict in Case VII (SouthEast Trial) speaks of the fundamental principles of justice which most nations have adopted.¹⁸ But justice is not the only thing to evolve and change. Views and judgments about facts of recent history are also subject to change based on the discovery of new historical sources. The view of history that prevailed in 1945 no longer agrees with today's.

The best example of this is the 1940 war in Norway. The Nuremberg trial of the chief war criminals dealt with the Norwegian campaign as a case of German aggression.¹⁹ Later publications, however, showed that long before the German plans were made, an attack on Norway's neutrality was being prepared in England, under the direction of the then Minister of Defense, Churchill.²⁰ On February 5, 1940, the Allied Supreme Council of War decided to deploy three or four divisions to Narvik, in northern Norway.²¹ In the night of April 7-8, 1940, British and French naval forces placed mines in Norwegian territorial waters.²² Thus, the British and French governments prepared and partially implemented an attack on Norway and its neutral status before the Germans ever did. Consequently, the view of history expressed by the International Military Tribunal in Nuremberg with respect to the case of Norway was wrong. We must ask that both sides be judged according to the same standards.

One can even go a step further and apply the so-called principle of *tu quoque* to suspend an aspect of international law if the opposing side also violates it. The International Military Tribunal applied this principle in favor of Admiral Dönitz with respect to his conduct of unrestricted submarine warfare when the American Admiral Nimitz testified that his forces had also engaged in unrestricted submarine warfare in the Pacific.²³ The American verdict in Case XII (trial of the *Wehrmacht* Supreme Command) stated that Germans may not be punished for an act for which Americans, British, French or Russians would not also be prosecuted or convicted.²⁴ Unfortunately this principle was not applied with anything near the desirable degree of consistency.

The principle of *tu quoque* is dangerous because it can lead to a disintegration of the fundamentals of international law, whereas what we need to do is to build up and consolidate a system of international law. If, however, two warring parties consistently disregard a judicial norm, the evolution and development of the law must be reviewed in the context of this *desuetude*.²⁵ Such a case represents a modification of common law.

II. Lawful Reprisals

a) Confusion of Concepts

The preceding general comments were necessary in order to create a solid foundation for understanding before we enter the maze of reprisal law. The late criminologist Franz Exner stated at the International Military Tribunal in Nuremberg that there is only one aspect of reprisal law about which there is absolute certainty, namely, that reprisals against prisoners of war are inadmissible, and that everything else is contested and by no means valid international law.²⁶ Even the definition of the various concepts is often unclear. In particular, the concepts of collective punishment, hostages, retaliation and reprisal are frequently confused. However, they are clearly distinct.

Collective punishment avenges a concrete individual act by punishing a group of persons who bear a share of the responsibility for the act. If such shared responsibility is not given, then under Article 50 of the Hague Land Warfare Convention of 1907 collective punishment is prohibited.²⁷

The term *retaliation* is also frequently used. This refers to the reaction to a breach of international law with a similar countermeasure.²⁸

Concerning the concept of *reprisals*, Oppenheim-Lauterpacht's definition has been most widely accepted.²⁹ According to this definition, a wartime *reprisal* is the case if one warring party retaliates against another by means which are otherwise unlawful acts of warfare, and with which he wants to force his opponent, his opponent's branches and the members of the opposing armed forces to give up their illegal acts of war and to return to the principles of lawful warfare.

This definition shows better than most others³⁰ that a reprisal is *not* retrospective punishment or revenge for past injury.³¹ Rather, a violation of international law by the opposing side is its prerequisite, and its purpose is to force this opposing side to limit itself to internationally lawful behavior in future.³² Reprisals differ from collective punishment in that they are directed against members of an enemy nation with *no* regard for their personal guilt, whereas collective punishment has such guilt as its particular requirement.³³ This difference

denied the active authorization to bring about the criminal punishment of another party. [Editor's remark: In law, desuetude (from French *désuétude*, from Latin *desuetudo*, meaning "outdated, no longer custom") is a doctrine that causes statutes, similar legislation or legal principles to lapse and become unenforceable by a long habit of non-enforcement or lapse of time.]

²⁶ Cf. Franz Exner, *IMG*, Vol. IX, p. 364.

²⁷ Cf. Laun, *op. cit.* (note 9), p. 48.

²⁸ Cf. Ernst Vanselow, *Völkerrecht*, Mittler, Berlin 1931, p. 85; Hyde, *op. cit.* (note 12), Vol. III, p. 1840, says: "similar in kind."

²⁹ Lassa F.L. Oppenheim, Hersch Lauterpacht, *International Law. A Treatise*, Vol. II, 6th ed., Longman, London 1944, 7th ed., *ibid.* 1952, §247; similarly §358 of the *American Rules of Land Warfare* (U.S. War Dept. General Staff (ed.), Gov. Print. Off., Washington 1914-15 & 1917) with approval of Hackworth, *op. cit.* (note 11), Vol. VI, p. 181. Cf. also Art. 8 of the *Italian Legge di guerra* of July 8, 1938, as well as Gaetano Sucato, *Istituzioni di diritto penale militare*, Vol. II, Stamperia reale di Roma, Rome 1941, p. 509.

³⁰ Eg. cf. Vanselow, *op. cit.* (note 28), p. 85; Eduard von Waldkirch, *Das Völkerrecht*, Helbing und Lichtenhahn, Basel 1925, p. 328.

³¹ Paul Fauchille, *Traité de droit international publique*, Vol. II, 8th ed., Rousseau, Paris 1921, No. 1022, emphasizes this.

³² Similarly Karl Strupp, *Wörterbuch des Völkerrechts*, Vol. I + II, de Gruyter, Berlin 1924f., p. 350; Franz von Liszt, Max Fleischmann, *Das Völkerrecht*, 12th ed., Springer, Berlin 1925, p. 439; Schütze, *op. cit.* (note 11), p. 41; Guggenheim, *op. cit.* (note 12), Vol. II, p. 583; Art. 358 of the *American Rules* of 1940; Fauchille, *op. cit.* (note 31), n. 1022, describes reprisals as "*moyen de coercion, non un châtement.*"

³³ Laun, *op. cit.* (note 9), p. 43, even suggests that reprisals were usually deliberately and on principle directed against innocent persons. But then he speaks of collective punishment without regard for guilt, and thus leaves the way open for misunderstandings. Hyde, *op. cit.* (note 12), Vol. III, p. 1843, points out, as do we, the clear distinction between "retaliation" and "penalty." Art. 454 of the *British Manual of Military Law* (by Lassa F.L. Oppenheim and J. E. Edmonds, Her Majesty Stationery Office, London 1929) emphasizes that "[...] reprisals [...] in most cases inflict suffering upon innocent individuals [...]." Rupprecht von Keller, *Der Geisel im modernen Völkerrecht*, dissertation, Mauser, Forchheim 1932, p. 57, aptly differentiates between reprisals and collective punishment by pointing out the differ-

is often overlooked. The American verdict in Case IX,³⁴ for example, speaks first of “reprisals” and then of “general penalty” in the sense of Article 50 of the Hague Land Warfare Convention. In this way the verdict comes to false conclusions with regard to “reprisals.”³⁵

Another difference between reprisals and collective punishment is that the former tries to achieve a specific mode of behavior on the part of the enemy,³⁶ whereas collective punishment finds its justification and its legal grounds strictly within the crime that was committed. In this way, one could perhaps draw a parallel between collective punishment and a court sentence, versus reprisals and measures taken by the police.

Reprisals differ from self-defense in that they have as their prerequisite an act that was committed in violation of international law, while self-defense has no such prerequisite. The two concepts are similar in that both aim to prevent future violations of the law.

If a reprisal interferes with the freedom or the lives of individuals, it overlaps with the concept of *hostage-taking*. We shall leave out of consideration the so-called *contractual hostages*, which may be taken as part of an international agreement in order to ensure its implementation, as well as hostages that were taken to enforce requisitions, contributions, etc.³⁷ *Security hostages*, however – forcibly taken guarantors for the lawful behavior of the opposing party³⁸ – do come within our present scope. These hostages are liable with their life, and if their side engages in unlawful actions, they become the victims of reprisals. But if persons are not taken prisoner for reprisal purposes until AFTER an act has been committed, then it is no longer appropriate to speak of hostages.³⁹ They are then reprisal prisoners.⁴⁰

In the subject literature, discussions about the permissibility of the execution of hostages always focus on the question of whether killing is a permissible form of reprisal. In this respect, the issue of the execution of hostages is identical to that of lawful reprisals.⁴¹

Let us investigate whether reprisals and the killing of security hostages were permissible up to 1949. Since customs and common law are very important in this context, let us first take a look at how reprisals were applied in practice.

b) Reprisals from 1863 to 1951

The American verdict in the SouthEast Trial (Case VII) assumed⁴² that the Germans had been the first to kill reprisal prisoners and security hostages. This is easily disproved.

Let us look first at the time preceding the *start of the First World War*.

As early as July 30, 1863, the American President Lincoln threatened to execute prisoners of war in retaliation against the killing of Negroes; General Sherman ordered the execution

ent elements of liability and punishment.

³⁴ Verdict of the American court-martial no. IX in Nuremberg, of April 10, 1948 (Case IX), Protocols, English text, pp. 6759f.

³⁵ The verdict overlooks the fact that Art. 50 of the Hague Land Warfare Convention regulates only the “general penalty,” but says nothing about retaliation and reprisals; similarly, Hyde, *op. cit.* (note 12), Vol. II, p. 1840, n. 1, unclear Guggenheim, *op. cit.* (note 12), Vol. II, p. 824.

³⁶ Hoppe, *op. cit.* (note 15), p. 48, describes them as measure to force submission. v. Keller, *op. cit.* (note 33), p. 37, says that their nature is expressed in their guarantee function. The Italian verdict of the Tribunale Territoriale di Limna of July 20, 1948 says aptly (p. 44): “La rapressaglia deve avere scopo repressivo e preventivo, non vendicativo.” (The reprisal measure must be repressive and preventive, not vindictive)

³⁷ Cf. Laternser, *Verteidigung deutscher Soldaten*, Bohnemeier, Bonn 1950, p. 128.

³⁸ Cf. Vanselow, *op. cit.* (note 28), p. 240.

³⁹ But this was the wording of an order of Hitler’s of March 23, 1944, in the case of the Via Rasella in Rome; cf. Laternser, *op. cit.* (note 37), p. 63.

⁴⁰ Cf. Hoppe, *op. cit.* (note 15), p. 50. Similarly, the American verdict in the SouthEast Trial, *op. cit.* (note 11), Protocols, p. 10320; Günther Lummert, *Die Strafverfahren gegen Deutsche im Ausland wegen Kriegsverbrechens*, Arbeitsgemeinschaft vom Roten Kreuz in Deutschland (British Zone), Hamburg 1949, p. 61; *Law Reports of Trials of War Criminals*, Vol. VIII, London 1948, Case 44 (Kesselring), p. 14.

⁴¹ In §358d of the American *Rules of Land Warfare* the problems of hostages and reprisals are also presented in a close relationship; cf. Laternser, *op. cit.* (note 37), p. 129.

⁴² *Op. cit.* (note 11), Protocols, p. 10324; also Oppenheim-Lauterpacht, *op. cit.* (note 29), 7th ed., Vol. II, p. 591, where the killing of hostages is treated as a one-sided (reprehensible) German practice.

of 54 prisoners of war as reprisal for the murder of 27 of his soldiers, whose bodies had been found bearing the notice “Death to the plunderers.”

During the Russo-Turkish War of 1877, the Russian Commander of Thessaly ordered that the inhabitants of houses from which shots had been fired at Russian soldiers be hung from their house doors.⁴³

Considerable numbers of hostages were also taken during the wars of the 19th Century, for example in the Italian wars of 1848/49 and 1859, in the Crimean War and in the German wars of 1864 and 1866, by the French in Algiers, by the Russians in the Caucasus, by the English in their colonial wars,⁴⁴ and in the Franco-Prussian War of 1870/71 as well.⁴⁵ In the latter case, as well as in the Boer War, hostages were taken predominantly to ensure safe conduct for railway trains.⁴⁶

In the First World War, set customs became established regarding the taking of hostages, as well as their execution, since the Germans, the Russians and the French (in Alsace) all took non-participants as security hostages.⁴⁷ Hyde tells of the execution of hostages by the Bulgarians.⁴⁸ According to Hackworth, the French government in 1918 suggested retaliation against an Austrian breach of international law; this retaliation was to involve the reprisal execution of two Austrian officers (prisoners of war) for each French airman who was killed.⁴⁹

After the First World War this practice was commonly retained and perpetuated. In December 1918, for example, the Belgian Commanders of occupied cities in the Rhineland ordered the taking of hostages whose lives were to guarantee the safety of the occupation troops.⁵⁰ In 1919, the Romanian General Mărdărescu demanded 500 hostages, of which he threatened to shoot 5 for each Romanian killed.⁵¹ In Beuthen, Upper Silesia, the French took more than 20 reprisal prisoners in retaliation against the shooting death of one major.⁵² Further, during the invasion of the Ruhr region in 1923, French Commanders imposed severe prison sentences on German persons in retaliation for acts of sabotage committed against the invaders by the populace.⁵³ Security hostages were also taken there on railway trains serving the French and Belgian regime.⁵⁴ During the political upheavals in Ireland in 1919-1921, the British troops carried out numerous reprisal killings.⁵⁵ And we should also mention that the French active service order of 1924 instructs that, when occupying enemy territory, “prendre des otages” (“take hostages”).⁵⁶

In the Second World War, the practice of taking and killing hostages was continued by all parties involved. The fact that it occurred frequently on the German side may be partially explained by the great extent of the enemy territory occupied by fairly weak military forces, but also by the fanatical resistance of the population of these occupied regions, who paid no heed to the relevant regulations of the Hague Land Warfare Convention of 1907.

⁴³ Account by Laternser, *op. cit.* (note 37), p. 192.

⁴⁴ Evidence in Hoppe, *op. cit.* (note 15), p. 26.

⁴⁵ For examples see v. Keller, *op. cit.* (note 33), pp. 47ff., Schütze, *op. cit.* (note 11), p. 46, and others.

⁴⁶ Cf. v. Keller, *op. cit.* (note 33), pp. 48-54. The railway hostages have been condoned by Oppenheim-Lauterpacht, among others: *op. cit.* (note 29), Vol. II, p. 259. Art. 463 of the British *Manual* objects to them because they are also endangered by legitimate incidents of war.

⁴⁷ Cf. Hoppe, *op. cit.* (note 15), p. 41; v. Kellers, *op. cit.* (note 33), pp. 25, 39.

⁴⁸ Hyde, *op. cit.* (note 12), Vol. III, p. 1903, No. 3.

⁴⁹ Hackworth, *op. cit.* (note 11), Vol. VI, p. 272. However, the American Department of States did not agree in this case.

⁵⁰ Evidence in Laternser, *op. cit.* (note 37), p. 192. Hoppe, *op. cit.* (note 15), p. 42, and v. Keller, *op. cit.* (note 33), p. 43, specifically mention the Belgian General Lemercier. – That the hostages were not killed was primarily due to the correct behavior of the Rhinelanders.

⁵¹ Cf. Hoppe, *op. cit.* (note 15), p. 42.

⁵² Cf. v. Keller, *op. cit.* (note 33), p. 43.

⁵³ *Ibid.*, pp. 44f.

⁵⁴ *Ibid.*, p. 54.

⁵⁵ Numerous references in Laternser, *op. cit.* (note 37), p. 74, Hoppe, *op. cit.* (note 15), p. 43, and others [cf. Winston Churchill, *The World in Crisis*, Vol. 5: “*The Aftermath*,” T. Butterworth, London 1929, pp. 278ff.]

⁵⁶ Cf. Vanselow, *op. cit.* (note 28), p. 240, A. 162 and Hoppe, *op. cit.* (note 15), p. 44.

Since the attitude of the civilians towards the German soldiers was more positive in Italy than in the other European countries, few executions of hostages and reprisal prisoners took place there, apart from the special incident of the “Fosse Ardeatine” (March 24, 1944).

Between 1941 and 1944 executions were especially numerous in the Balkans, where partisan activities were particularly widespread. In this respect, the Chief of the *Wehrmacht* Supreme Command issued an order on September 16, 1941, which named the vengeance death of 50 to 100 Communists per German soldier as generally appropriate ratio.⁵⁷ On the basis of this order, an attack of bandits at Topola (resulting in 22 dead and 16 missing on the German side) was followed by the order to execute 2,200 prisoners; 449 were in fact executed.⁵⁸ There were also numerous other instances of hostage killing, but the ratio of 1:100 was never applied.

The war in *Russia* also led to reprisals. Paget,⁵⁹ for example, reports that 50 hostages were shot in Simferopol in the Crimea, after executions at a ratio of 1:100 had been threatened as vengeance against bomb explosions where Germans were killed.

In the Belgian trial of General von Falkenhausen, the conditions in *Belgium* and *northern France* were discussed in detail. In particular, an extensive collection of documents was presented, which Behling has supplemented with a chronological table of the executions.⁶⁰

This was a case of numerous attacks by partisans. Reprisal executions followed in each case; the ratio of victims of the attacks to hostages executed varied from 1:5 to 1:25. Generally, 10 Belgians or French were shot per German killed.⁶¹ The number depended on the circumstances of each particular case, for example on the severity of the attack.

In one case, after a German soldier was murdered in Haarlem, *Holland*, the execution of 100 prisoners was ordered; 10 were actually shot.⁶²

There is no need to go into details here, since the German side always took pains to establish the permissibility of reprisals and reprisal killings. Examples from the *opposing sides*, on the other hand, are more impressive. The aforementioned collection of documents from the Falkenhausen Trial contains extensive materials on this topic.⁶³ We shall just mention the following example.

After the capture of Bengasi, Montgomery stated that he believed that numerous mines and traps had been set in the city. For every British soldier who was killed, he would have 10 Italians shot.⁶⁴ A November 30, 1944 radio message from the Allied headquarters in Paris stated:⁶⁵

“Regarding General Leclercq’s proclamation in Strassbourg, according to which 5 hostages were to be shot for every French soldier killed in ambush, Headquarters has ordered that Allied expedition troops operate in accordance with the Geneva Convention of 1929 and especially its Article 2, which states that reprisals against prisoners of war are prohibited.

Under martial law, however, taking hostages in order to ensure that the inhabitants of the occupied territory obey the orders of the military government is permitted by the laws of warfare. Such hostages may be tried in court, and even sentenced to death.

⁵⁷ Cf. the American verdict in the SouthEast Trial, *op. cit.* (note 11), Protocols, p. 10 345, and Schütze, *op. cit.* (note 11), p. 47. For the individual cases, cf. Laternser, *op. cit.* (note 37), pp. 222-227.

⁶⁴ Falkenhausen Document 55.

⁶⁵ Falkenhausen Document 56 b.

Therefore, under certain circumstances – especially in cases where civilians have violated the orders of the Geneva Convention – the threat expressed by General Leclercq may be enforced, but not against prisoners of war.”

According to Falkenhausen Document 58a, 6 officers and 34 soldiers were executed at Annecy (Haute Savoie), and another 40 Germans at Habère, as reprisal for atrocities allegedly committed by a Russian battalion.

On April 24, 1945, in Reutlingen, Württemberg, four reprisal prisoners were shot by the French for the murder of a French soldier.⁶⁶ On April 28, 1945, the following announcement was made in Leutkirchen:⁶⁷

“[...] 4. If a German shoots at Frenchmen, or if any other incident whatsoever happens, 5 houses will be torched and 100 Germans executed.

[...] 6. I am responsible, on pain of my own death, to ensure that these orders are enforced [...] the Mayor [...].”

In Markdorf, 4 German civilians were executed per 1 French soldier shot.⁶⁸

In Saulgau it was proclaimed on April 27, 1945, that if a French soldier were killed or even only wounded, 20 hostages would be shot and the corresponding city district would be burned to the ground.⁶⁹

The Berlin Ordinance of July 1, 1945,⁷⁰ stated, inter alia:

“Anyone who commits an attack on a member of the occupation forces or on a bearer of official functions, or who commits arson for reasons of political enmity, seals not only his own fate but that of 50 former members of the Nazi Party as well. Their lives are forfeit together with that of the assassin or arsonist.”

Falkenhausen Document 74 tells of the execution of 8-12 Germans for one officer killed during the American march-in in Treseburg.

Further threats of reprisal killings were proven in the SouthEast Trial in Nuremberg in Case VII;⁷¹ examples include a ratio of 1:25 in Stuttgart, 1:10 in Birkenfeld, 1:30 in Markdorf, and an American threat of 1:200 in Harz. Hoppe⁷² mentions further that the Americans took French officials hostage in 1941 in Syria; as well, the Russians took Persian officers hostage in 1949 in Azerbaijan. Further, the French took and killed hostages in Indochina.⁷³ Sonnenburg⁷⁴ reports that the French shot 80 prisoners of war in Fort Mont Lucon in 1944, as well as 20 hostages in Saigon in May 1951.

According to the publication *Der Heimkehrer*,⁷⁵ French officers and soldiers returning from Indochina stated that they could not understand what was happening at that time, 7½ years after the war, to the former members of the German occupation forces. They pointed out that incidents like Oradour take place in Indochina on a weekly basis, and must take place, in fact, for the sake of the protection of the French troops there.

As we can see, hostages were taken by all sides in World War Two, and in many cases they were also killed as reprisal.

c) Fundamental Permissibility of Reprisals

From the way in which reprisals were used we can conclude that they were applied as a form of lawful justice. Therefore, for the time prior to the Geneva Convention of August 12, 1949, and in the context of our previous findings (cf. p. 528), the permissibility of reprisals per se

⁷⁵ Edition of October 1952.

– disregarding for the moment the individual circumstances and prerequisites, and the legal consequences – may be considered to have been an international custom expressing a general practice acknowledged as lawful.

At times this common law has been disputed in the subject literature. However, the overwhelming number of examples from the first half of the 20th Century proves the fundamental permissibility of reprisal measures during the Second World War. It was not until the Geneva Convention of August 12, 1949, that this state of affairs was changed, but of course only for the time following, not retroactively for the past.

The earlier international agreements do not oppose the development of common law regarding the use of reprisals. In particular, Article 50 of the Hague Land Warfare Convention dealt only with collective punishment, but not with reprisals and not with hostage-taking.⁷⁶

We would point out that in Italy, both Article 8 of the Martial Law of July 8, 1938, and Article 176 of the *Codice Penale Militare di Guerra* acknowledge the permissibility of reprisals. Article 358d of the *American Rules of Land Warfare* of 1940⁷⁷ also permits reprisals, including the killing of reprisal prisoners.

In its Articles 452-464, the British *Manual of Military Law*³³ fundamentally permits reprisals. Only in its Article 461 does it forbid the killing of contractual hostages. This does not prohibit the killing of reprisal prisoners. And in the Kesselring trial, which dealt mostly with the permissibility of the execution of reprisal prisoners, the Judge Advocate General stated on May 3, 1947:⁷⁸

“However, I have come to the conclusion that there is nothing which makes it absolutely clear that in no circumstance and especially in the circumstances which I think are agreed in this case – that no innocent person properly taken for the purpose of a reprisal cannot be executed.”

Thus, British law also permits the execution of reprisal prisoners.⁷⁹ In Germany there was no Martial Law and no special *Manual*; but the permissibility of reprisal killings has been much discussed in German and Swiss literature, and affirmed without exception.⁸⁰ The American verdict in the SouthEast Trial (Case VII) stressed⁸¹ that many nations, including the USA, Great Britain, France and the Soviet Union, have acknowledged the lawfulness of the execution of hostages. Incidentally, other academic literature is also predominantly in favor of viewing reprisals, including reprisal killings, as permissible.⁸² Only a minority has

⁷⁶ For details cf. i Schütze, *op. cit.* (note 11), pp. 54 and 80; cf. also note 2 regarding Art. 452 of the British *Manual*, and v. Keller, *op. cit.* (note 33), p. 37.

⁷⁷ Commented on by: Hackworth, *op. cit.* (note 11), Vol. VI, p. 181 s.

⁷⁸ Report by Latenser, *op. cit.* (note 37), p. 193, and Schütze, *op. cit.* (note 11), p. 85.

⁷⁹ This was already pointed out by James M. Spaight, *War Rights on Land*, Macmillan, London 1911, p. 465, and Sheldon Glueck, *War Criminals, Their Prosecution and Punishment*, A. A. Knopf, New York 1944, p. 55, both cited in Latenser, *op. cit.* (note 37), p. 193. Much harsher measures, which in fact violate international law, are urged by the *Handbook of Modern Irregular Warfare*, Pamphlet No 1: “The Principles of Irregular Warfare” (Document Warlimont No. 10 in Case V before the American Military Tribunal in Nuremberg). This work states, among other things: “[...] 7. [...] best method of dealing with informers is their ruthless extermination as soon as discovered. Pin a note to the body saying why they were killed [...] 8. for the time being every soldier must be a potential gangster [...]: use the gangster methods [...] 9. close combat [...] you have to kill [...] a strangle hold from behind [...]”

⁸⁰ Eg. cf. Vanselow, *op. cit.* (note 28), p. 241; Johann C. Bluntschli, *Das moderne Völkerrecht*, 3rd ed., Beck, Nördlingen 1878, p. 319; F. von Liszt, M. Fleischmann, *op. cit.* (note 32), p. 493; Josef Kohler, *Grundlagen des Völkerrechts*, Enke, Stuttgart 1918, p. 218; Alfons Waltzog, *Recht der Landkriegsführung*, Vahlen, Berlin 1942, p. 83; Hoppe, *op. cit.* (note 15), p. 134; Schütze, *op. cit.* (note 11), pp. 56, 74, 79, with co-authors; also, Lummert, *op. cit.* (note 40), p. 63, and Hans-Heinrich Jescheck, *Die Verantwortlichkeit der Staatsorgane nach Völkerstrafrecht*, Röhrscheid, Bonn 1959, p. 335. On a tangent, Ernst Schneeberger, “Reziprozität als Maxime des Völkerrechts,” *Schweizerische Juristenzeitung*, 6 (1948), pp. 201-208, here p. 207; instead of reprisals he acknowledges only “negative reciprocity.”

⁸¹ SouthEast Trial, *op. cit.* (note 11), Protokolle, p. 10325ff.

⁸² Cf. Glueck; Flore; Pfenniger; Rivier; Hammer and Salvin; Kuhn; Ellery C. Stowell, *International Law*, Holt, New York 1931; Jessup; Pilloud, all of them cited in Hoppe, *op. cit.* (note 15), pp. 69 and 93; verdict of the permanent court-martial of Brussels, 2nd French Chamber of March 9, 1951, (cf. note 60: Falkenhausen), pp. 28 f; verdict Lippert, *op. cit.* (note 15), pp. 36f., and the American verdict in the SouthEast Trial, *op. cit.* (note 11), pp. 10325ff., where it is also pointed out that many nations, including the United States, Great Britain, France and the Soviet Union, have acknowledged the execution of hos-

rejected them, and called them a war crime;⁸³ however, these minority voices have lost their weight by the fact that soldiers from their own nations have themselves applied reprisals as common law. Their rejective view can thus be accorded value only in the context of efforts to abolish this common law.⁸⁴

d) Prerequisites for Reprisals

The acknowledgement of reprisal killing as common law has provided a basis for further analysis. From what has been said so far, we can also draw conclusions as to individual prerequisites as well as regarding the degree of the reprisals (to be discussed in Section e).

Where prerequisites are concerned, Exner's view⁸⁵ that there is nothing about this issue that is not disputed would seem to be accurate. However, there is much that can be eliminated from this dispute if we remember the difference between collective punishment and reprisals (cf. previous, p. 531). A reprisal does not in *any way* require *blame* or *guilt* on the part of the person affected. This is why, for example, the prosecutor in the Kesselring Trial falsely accused the defendant of having made use of innocent persons.⁸⁶ This is also why reprisals may be imposed on persons or groups of persons that were demonstrably innocent of the violation of international law that is to be avenged.⁸⁷

From practical examples, from martial laws and from jurisprudence we can derive a number of other prerequisites.

1. Punishments may be imposed on the basis of actions of individual persons. Where reprisals are concerned, it is disputed whether the actions of any single individual can give grounds for a reprisal. For example, Strupp⁸⁸ requires that the action must emanate from the enemy state. According to Article 358c of the American *Rules of Land Warfare* of 1940, however, illegal acts justifying a reprisal can be committed by a government, its military commanders, or a community or group of its individuals. According to Article 453 of the British *Manual of Military Law*, they can be committed by a government, by its military commanders, by several persons, or by individuals. Consequently, the actions of any single individual can give rise to a reprisal.⁸⁹
2. The action that gives rise to a reprisal must *violate international law*. Where partisan activities are concerned, the question is first of all whether the partisans, in accordance with Article 1 of the Hague Land Warfare Convention, wore an insignia clearly visible from a distance, and whether they bore their arms openly. Consequently, the partisan

tages as being lawful; cf. also Sterling E. Edmunds, *The Lawless Law of Nations*, J. Byrne, Washington, D.C., 1925; German trans.: *Das Völkerrecht, ein Pseudorecht*, de Gruyter, Berlin 1933, p. 331, printed as Falkenhausen Document No. 1. Cf. also Fauchille, *op. cit.* (note 31), n. 1021; he adds his regrets about the cruelty involved.

⁸³ Cf. Roosevelt, Bernadotte, Westlake, Wheaton, Melen, all of them cited in Hoppe, *op. cit.* (note 15), pp. 95f., also Pietro Nuvolone, *La punizione dei crimini di guerra*, Edizioni della bussola, Rome 1945, p. 139. – Oppenheim-Lauterpacht *op. cit.* (note 29), 7th ed., Vol. II, p. 592, declares the killing of hostages to be a “war crime”; he completely overlooks the fact that it was used by all warring parties; cf. also his error already discussed in the previous, note 42.

⁸⁴ Let us hope that the abolition of reprisals, as decided at the Geneva Convention of August 12, 1949, will be carried through and that the reprisals of recent years (cf. prev. pp. 534f.) will remain exceptions and will not re-establish the old common law.

⁸⁵ Exner, *IMG*, Vol. IX, p. 364.

⁸⁶ Cf. Laternser, *op. cit.* (note 37), p. 72.

⁸⁷ Eg. Schütze, *op. cit.* (note 11), p. 73, and Rolin, Oppenheim-Lauterpacht and Hyde, cited there. Cf. also Fauchille, *op. cit.* (note 31), n. 1019, as well as Westlake, quoted in Laternser, *op. cit.* (note 37), p. 73.

⁸⁸ Strupp, *op. cit.* (note 32), p. 350.

⁸⁹ On the other hand, the Oct. 25, 1952, verdict of the Italian *Tribunale Supremo Militare* in the Kappler Case states (regarding B, 3): “L’inosservanza che legittima la rappresaglia del nemico deve essere effetto di azione od omissione imputabile allo Stato, rispettivamente in contrasto con divieti o comandi del diritto internazionale.” (The non-observance that legitimizes reprisals by the enemy must be the effect of an action or omission attributable to the state that are in violation of prohibitions or commands of international law, respectively.) It disputes that these prerequisites were met in the case of the assassination in the Via Rasella on March 23, 1944, which was committed by partisans. With that, the Court is in opposition to the rules mentioned in the text, which must be regarded as expression of the international legal regulations that are in force.

activity in the Balkans has been described as a violation of international law.⁹⁰ Similarly, the July 20, 1948, verdict of the Tribunale Territoriale di Roma had declared that the bombing attack perpetrated against the German police company in the Via Rasella in Rome on March 23, 1944, had been in violation of international law (verdict p. 42).

3. Further, the application of reprisals requires that an appropriate investigation has been conducted first. Article 358b of the American *Rules of Land Warfare* speaks of a “careful inquiry.”⁹¹ However, the circumstances surrounding the incident must also be considered. In reprisals, a quick reply to the violation of international law is important. If, for example, all likely participants in a crime have been arrested and their guilt has been established, it is not necessary to wait and see if more evidence might turn up in the future.
4. Another prerequisite that has been mentioned is that a *public warning* shall precede the implementation of any reprisal.⁹² This would mean that relevant proclamations warning of reprisals are issued, either during march-in, or after the first attack to stave off any repetition thereof. Such warnings would certainly be nice; but neither the American *Rules* nor the British *Manual* require them, and so we cannot consider them an absolute prerequisite.
5. Besides the prerequisites already discussed, there is also the decisively important factor of *military necessity*. In this context, Article 358b of the American *Rules* states that the reprisals must never be a means of mere vengeance, but an inevitable last resort in order to force an enemy to give up an unlawful practice. Thus, Fauchille⁹³ states that reprisals must be a matter of necessity. Like Vanselow, Sibert, Bluntschli and the verdict in the Falkenhausen Trial, Hyde states that military necessity is the only limit on reprisals.⁹⁴ Oppenheim adds:⁹⁵

“Victory is necessary in order to vanquish the enemy, and this necessity justifies all the indescribable horrors of war, the immense sacrifices of human life and health and the inevitable destruction of property and the devastation of land. Aside from the limits imposed on the warring parties by international law, all kinds and degrees of force can and at times must be applied in war in order to achieve that goal, in spite of the cruelty and the extremes of misery that war brings with it. War is a struggle for existence waged between nations, and no degree of individual suffering and hardship can be specially taken into account; the national existence and independence of the warring nations is a higher consideration than any individual welfare.”

We must particularly keep in mind that the Hague Land Warfare Convention, according to Section 6 of its Introduction, serves only as a *general guideline* for the warring parties in their relations with each other and the population, and applies only insofar as *military interests permit*. Far too little attention was paid to this restriction in the post-war trials. Many an excessively harsh verdict has been due to this omission. The Introduction makes it clear that military necessity plays an important role in the application

⁹⁰ Cf. Schütze, *op. cit.* (note 11), p. 48, and the American verdict in the SouthEast Trial, *op. cit.* (note 11), p. 10314.

⁹¹ Similarly, Art. 456 of the British *Manual*. Laternser, *op. cit.* (note 37), p. 76, speaks of an appropriate investigation. – The American verdict in the Wilhelmstraßen Trial, *op. cit.* (note 11), also demands (Protocols, p. 28078) that attempts should be made to isolate the guilty person/s and to try them before a court of law.

⁹² Eg. Waltzog, *op. cit.* (note 80), p. 83; Laternser, *op. cit.* (note 37), p. 199; Julius Hatschek, *Völkerrecht*, Deichert, Leipzig/Erlangen 1923, p. 405 regarding b; Fauchille, *op. cit.* (note 31), n. 1023, and the American verdict in the Southeast Trial, *op. cit.* (note 11), p. 10323. – Jackson, *IMG*, Vol. IX, p. 362, stated that a protest must precede reprisals.

⁹³ Fauchille, *op. cit.* (note 31), n. 1023. For further references to the prerequisite of military necessity, cf. Hoppe, *op. cit.* (note 15), pp. 71-74, e.g., Wright, Spaight and §22f of the American *Rules*. The American verdict in the trial of the Wehrmacht Supreme Command rejects this characteristic, *op. cit.* (note 24) (Protocols p. 9932).

⁹⁴ Hyde, *op. cit.* (note 12), Vol. III, p. 1843. Similarly, Vanselow, *op. cit.* (note 28), p. 241; Sibert, *op. cit.* (note 12), p. 564; verdict Falkenhausen, *op. cit.* (note 82), pp. 28f; Bluntschli, *op. cit.* (note 80), p. 319; Aristide Manassero, *I codici penali militari*, Vol. 1 + 2, 2nd ed., Giuffrè, Milan 1951, Vol. II, p. 555.

⁹⁵ Lassa F.L. Oppenheim, *International Law*, 4th ed., Longman, London 1926, Vol. II, p. 123 [retranslated from German], quoted by: Laternser, *op. cit.* (note 37), p. 191.

of the Hague Land Warfare Convention and that the latter does not define formal conditions. Even at that early date the authors left room for natural developments; and the developments after 1907 must be considered (cf. previous, p. 529). But this can only be done if the factor of military necessity is given the attention it deserves. In the American verdict against the Japanese General Yamashita, military necessity was treated as a decisive factor.⁹⁶

6. The American verdict in Case VII (SouthEast Trial) demanded another prerequisite, namely a *link* between the place of the crime and that of the reprisal; the victims of the reprisal, it said, should come from the same area where the unlawful attack took place.⁹⁷ We have not found this prerequisite expressed anywhere else in the subject literature. Further, it is not justified. The required characteristic of military necessity for the reprisal action means that there must be an inquiry into whether the action and its scope was militarily necessary. In this way, even if there is no connection between the location of the crime and that of the reprisal, a retrospective observer may perceive the military necessity in, for example, the circumstance that a reprisal managed to restore peace to a previously unruly region.
7. In the aforementioned SouthEast Trial verdict, the American court identified a number of further prerequisites for a reprisal.⁹⁸ It stated that all sorts of rules ought to have been proclaimed before any hostages were executed. These rules include:
 1. Registration of the inhabitants,
 2. mandatory carrying of passports and ID cards,
 3. the establishment of prohibited zones,
 4. restriction of the people's freedom of movement,
 5. introduction of curfew hours,
 6. prohibition of assembly,
 7. detention of suspect persons,
 8. traffic restrictions,
 9. restrictions on food supply,
 10. evacuation of areas of unrest,
 11. imposition of mandatory financial contributions,
 12. forced labor to make up for the damage done by sabotage,
 13. the destruction of property at the location of the crime,
 14. as well as other measures that are not forbidden by international law and which are likely to produce the desired result.

This verdict is an isolated case. Nowhere else have we found demands such as these – concocted in a bureaucratic ivory tower, and quite impracticable. One does not need to have been in the Balkans to realize that such measures were not suited to preventing acts of sabotage. Only a small part of the measures listed could be applied in Central Europe or in the United States within the framework of military necessity.

e) Enforcement of Reprisals

As we can see, reprisals could be ordered if there was a military necessity for them. Now let us examine how they were to be carried out.

1. The matter of who is *responsible* for ordering the reprisals is not entirely clear. An individual soldier may not take reprisal measures on his own initiative. Article 358b of the American *Rules*, for example, states that the highest available office should be consulted, unless military necessity demands immediate action. According to Article 455 of the British *Manual*, “even though there are no international rules on the subject, reprisals should never be ordered by an individual soldier, but only ever by a com-

⁹⁶ Cf. A. Frank Reel, *The Case of General Yamashita*, Univ. of Chicago Press, Chicago 1949, p. 296, No. 13, in a similar vein Manassero, *op. cit.* (note 94), p. 555.

⁹⁷ SouthEast Trial, *op. cit.* (note 11), Protocols, p. 10354. Elsewhere this verdict speaks of a connection of geographic, racial or other nature.

⁹⁸ *Ibid.*, p. 10322.

mander.” In the case of France, Fauchille⁹⁹ states that the orders for a reprisal should come from the commanding General, if possible. According to Article 10, Section 2 of the Italian Martial Law of July 8, 1938, reprisals... if immediate and exemplary action is necessary,... may be ordered by any other “*comandante*” as well. Such a “*comandante*” can be a soldier, for example,¹⁰⁰ who has an operating unit under his command;... it must be a unit which allows its commander the opportunity for initiative, even if limited.

In Germany, reprisals were to be ordered by a higher commander, generally a divisional commander.¹⁰¹ As Laternser comments aptly, there was no applicable rule of martial law here, especially since lower-ranking commanders were also responsible in the English, American and Italian armed forces. Therefore, since reprisal law in particular is governed by the principle of reciprocity,¹⁰² other commanders could also lawfully order reprisals during the Second World War, despite this purely German regulation. This is why Waltzog¹⁰³ says, correctly, that the regulation stating that only a divisional commander could give the order was binding only for as long as the opponent also observed such a restriction. But since Germany’s opponents in World War Two acted differently even in their formal regulations, German commanders of lower rank similar to English commanders or Italian comandantes were also entitled to order reprisals.

In conclusion we shall add that the American verdict in Case VII (SouthEast Trial) expresses the opinion that under international law a *judicial decision* is required prior to an execution.¹⁰⁴ This view is incorrect. Under continental law reprisals are never within the jurisdiction of a court. Courts are responsible only for punishment, not for the assessment of military necessities. The opinion expressed in the verdict proves that the court confused the concepts of reprisals and punishment.

2. Where the *extent of reprisals* is concerned, practice and legislation as well as the subject literature of international law are very unclear. The numerous examples of practical cases, of which we have mentioned a few (cf. Section b), range from a ratio of 1:1 to one of 1:200 (Americans in April 1945, in the Harz). Similarly, only a part of the authors contributing to the subject literature support the theoretical demand for a balance between the number of victims of an assassination and that of the victims of the resulting reprisal.¹⁰⁵ Schütze advocates proportionality, but declares the principle to be a flexible one and suggests that the extent of the reprisal is determined primarily by its purpose, which is to be an effective means of coercion.¹⁰⁶ Lo Cascio considers the limit of a reprisal to be an appropriately high quotient of damage sustained versus inflicted.¹⁰⁷ On the other hand, Strupp, Hatschek, Fauchille, Hyde, Lummert and others reject the requirement of proportionality outright.¹⁰⁸

⁹⁹ Fauchille, *op. cit.* (note 31), No. 1024.

¹⁰⁰ Cf. Sucato, *op. cit.* (note 29), Vol. II, pp. 507f.

Fleischmann, *op. cit.* (note 32), p. 4397; Oppenheim-Lauterpacht, *op. cit.* (note 29), 6 th. ed., p. 115; the American verdicts in the South-East Trial, *op. cit.* (note 11), p. 10320, and in Case IX (*op. cit.* (note 34), p. 6982); Art. 459 of the British *Manual*; Art. 358e of the American *Rules*; *Law Reports*, *op. cit.* (note 40), case 43 (von Mackensen/Mältzer), p. 5; Nuvolone, *op. cit.* (note 83), p. 137.

¹⁰⁶ Schütze, *op. cit.* (note 11), p. 65; similarly, Jescheck, *op. cit.* (note 80), p. 223.

¹⁰⁷ Lo Cascio, in *Archiv des Völkerrechts*, Mohr, Tübingen, Vol. III, 1952, pp. 357-366, here p. 366.

¹⁰⁸ Strupp, *op. cit.* (note 32), p. 351; Fauchille, *op. cit.* (note 31), n. 1024; Hatschek, *op. cit.* (note 92), p. 405; Hyde, *op. cit.* (note 12), Vol. III, p. 1843, n. 9; v. Waldkirch, *op. cit.* (note 30), p. 328; Vanselow, *op. cit.* (note 28), p. 85; v. Keller, *op. cit.* (note 33), p. 59; Hoppe, *op. cit.* (note 15), p. 89; Lummert, *op. cit.* (note 40), p. 60; Schneeberger, *op. cit.* (note 80), p. 207.

Repeatedly we also see the matter of military necessity being considered in setting the extent of a reprisal. For example, von Keller¹⁰⁹ states aptly that the number of prisoners must be high enough that pressure is actually exerted on those responsible. Fauchille writes:¹¹⁰

“Il faut donc qu’elles (les représailles) soient de nature à faire impression sur ceux-là-mêmes dont dépend la cessation de cette conduite.” (Therefore, the reprisals must be of a nature to make an impression on those on whom the cessation of this conduct depends.)

Thus, the extent of a reprisal ultimately becomes a matter of the military commander’s situational judgment.¹¹¹

In view of all this, we can sum up by saying that there was no set common law with respect to proportionality, much less with regard to a ratio of 1:1. And thus we must agree with Laternser,¹¹² that in the Italian case of the Fosse Ardeatine on March 24, 1944, given the particular circumstances in Rome (only 20 km behind the Nettuno front), the execution of 330 Italians ordered in reprisal for the death of 33 German policemen¹¹³ did not exceed the degree warranted by military necessity.

Another factor in determining the extent of a reprisal is the further damage it can prevent. For example, a reprisal may prevent a riot that would involve further loss of life on both sides. The balance, therefore, must be comprehensively qualitative, not schematic.¹¹⁴

3. Not only the number of victims, but also the *circumstances of the reprisal’s enforcement* are determined by military necessity. Just as the ordering of a reprisal killing must be the last resort, the manner of its implementation must also be limited. Since a reprisal, in its individual case, suspends a norm of international law, its implementation must be limited and must observe the principles of humaneness as far as possible.¹¹⁵

An important aspect of this is that a reprisal must be carried out *quickly* in order to be effective.¹¹⁶ For this reason it is not generally possible to prepare for it in every detail. Rather, it is better to accept some disadvantages if the speed of implementation would suffer otherwise, and perhaps even necessitate harsher measures.

4. The *termination of reprisals* is also limited by military necessity. As soon as such necessity ends – specifically, as soon as the opponent gives in to the pressure exerted on him and ceases to act in violation of international law – the measures ordered as coercion must be ended.¹¹⁷

[...] ⁸

¹⁰⁹ v. Keller, *op. cit.* (note 33), p. 59.

¹¹⁰ Fauchille, *op. cit.* (note 31), n.1024.

¹¹¹ Cf. also Lummert, *op. cit.* (note 40), p. 61.

¹¹² Laternser, *op. cit.* (note 37), pp. 76f.

¹¹³ Since more policemen eventually died of their injuries, the number of casualties is even greater. Additionally there were about 60 officers severely injured, so that the bottom line is a ratio of about 1:3 to 1:4.

¹¹⁴ Cf. Reinhard Frank, *Strafgesetzbuch*, 18th ed., Mohr, Tübingen 1931, p. 153; Karl Siegert, *Notstand und Putativnotstand*, Mohr, Tübingen 1931, p. 24; Heinrich Henkel, *Der Notstand nach gegenwärtigem und künftigem Recht*, Beck, Munich 1932, pp. 43 ff.; Reinhart Maurach, *Kritik der Notstandslehre*, Heymann, Berlin 1935, pp. 72 ff., esp. pp. 79ff. (reprint: Keip, Goldbach); Edmund Mezger, *Strafrecht, I. Allgemeiner Teil. Ein Studienbuch*, 4th ed., Beck, Munich 1952, §48; Adolf Schönke, *Strafgesetzbuch, Kommentar*, 6th ed., Beck, Munich 1952, p. 199; Giuseppe Bettiol, *Diritto penale, parte generale*, 2nd ed., Driulla, Palermo 1950, pp. 251ff. The latter rightly calls for a “bilanciamento qualitativo” (qualitative balance, p. 254).

¹¹⁵ Accordingly, Section 9 of the Introduction to the Hague Land Warfare Convention after the “lois de l’humanité et les exigences de la conscience publique” (laws of humanity and the demands of public conscience); cf. Hoppe, *op. cit.* (note 15), p. 90.

¹¹⁶ Jackson (*IMG*, Vol. IX, p. 362) says that a reprisal must be carried out within an appropriate period of time; also Hoppe, *op. cit.* (note 15), p. 117.

¹¹⁷ Cf. Guggenheim, *op. cit.* (note 12), Vol. II, p. 586, and the British *Manual*, Art. 460.

IV. Higher Orders

If the foregoing considerations regarding reprisal law and requisitions had been consistently applied in the trials of the post-war years, then under the principle of “equality under the law” a large part of our prisoners of war would already have to have been acquitted. In the remaining cases, where such measures must be assumed to have been a violation of international law, one must consider the additional factor of higher orders. We shall investigate this in the following.

a) General Principles

Superiors’ orders have always had special significance regarding the criminal liability of a subordinate obeying them. It would be impossible to command soldiers or police forces if the subordinates were authorized or perhaps even obliged to examine the lawfulness of an order before carrying it out. Alternatively, every military or police commando would have to be assigned its own legal adviser. For this reason, military law has everywhere and at all times depended on discipline, *i.e.*, on the *general principle that the subordinate must obey his superior’s orders if such orders are given within the limits of his jurisdiction*. Consequently, if the carrying-out of the order constitutes a violation of some law, criminal liability is on principle restricted to the superior who had given the order, and conversely the subordinate who had obeyed the order on principle remains exempt from liability. This is explicitly set out by §47 of the German Military Criminal Code, by Article 18 of the Swiss Military Criminal Code, by Article 40 Sections 2 and 3 of the Italian *Codice Penale Militare di Pace*, and by other regulations.¹¹⁸ For example, §443 of the British *Manual of Military Law* of 1914 decreed that members of the armed forces who violated accepted rules of warfare on the orders of their commanding officers are not war criminals and therefore cannot be punished by the enemy.¹¹⁹ Similarly, Article 347 of the American *Rules of Land Warfare* ruled out the punishment of subordinates obeying orders.

As a practical example we would mention the execution of the order issued to the British Admiral James Somerville, to sink the French fleet at Oran in the summer of 1940; 1,500 French sailors lost their lives in the process.¹²⁰ In France, Article 327 of the Code penal rules out liability for manslaughter or bodily harm if the actions in question were ordered by the law or by the lawful government.¹²¹ – The other nations had similar regulations.

Thus, we find that even during the first years of World War Two the regulations in force in the various nations were quite similar to each other.

b) Post-1944 Break with Traditional Principles

But after 1944 this tradition was overthrown. The first step was taken by the American scholar Glueck,¹²² who suggested that since the application of the non-liability clause contained in the British and American regulations would in many cases prevent the conviction of war criminals, it was necessary to pass a new and realistic regulation.

Similarly, the English author Lauterpacht changed his views.¹²³ Consequently, the majority of the Allied nations adjusted their principles regarding actions based on orders.¹²⁴ This

¹¹⁸ The view expressed here is also shared by Oppenheim, Manner and Kelsen, who are quoted in Laternser, *op. cit.* (note 37), pp. 116ff.

¹¹⁹ Quoted according to Aschenauer, “Richterliche Nachprüfungspflicht und Handeln auf Befehl,” in *Die andere Seite*, Juni 1950, pp. 2-41, here p. 27. Another reference in Erich Schwinge, “Angehörige der ehemaligen deutschen Wehrmacht und der SS vor französischen Militärgerichten,” *Monatsschrift für deutsches Recht*, 1949, pp. 650-654, here p. 650.

¹²⁰ Cf. Paget, *op. cit.* (note 59), p. 140, and Aschenauer, *op. cit.* (note 119), p. 30.

¹²¹ Cf. Aschenauer, *ibid.*, pp. 25f., with further references regarding disputed aspects of Art. 526 of the Justice Militaire of 1928, which regulates the punishment of insubordination; cf. also Henri Donnedieu de Vabres, *Précis de droit criminel*, 2nd ed., Dalloz, Paris 1951, pp. 72ff.

¹²² In: Sheldon Glueck, *War Criminals, their Prosecution and Punishment*, quoted by Aschenauer, *op. cit.* (note 119), p. 27.

¹²³ Cf. Oppenheim-Lauterpacht, *op. cit.* (note 29), 6th ed., Vol. II, pp. 452f.

¹²⁴ Cf. K. Heinze, K. Schilling, *op. cit.* (note 19), p. 131, No. 161; Smith, *op. cit.* (note 15), p. 47; Jescheck, *op. cit.* (note 80), pp. 260f.

is how the American *Rules* (Article 347) and the British *Manual of Military Law* (§443) came to be revised, giving rise to special laws – such as Article 3 of the French Ordonnance of August 28, 1944,¹²⁵ the Danish bill of July 12, 1946, §5 of the Norwegian law governing the punishment of war criminals, §13 of the June 19, 1945, Decree of the Czech President, and the Belgian law of June 26, 1947.¹²⁶ The new and retroactive regulations of all these laws corresponded with the London Agreement of August 8, 1945, in introducing the criminal liability of the subordinate following orders, and reduced the circumstance of higher orders to no more than a mitigating factor whose precise extent would depend on the court.

These are the Special Laws under which the trials of the German, Italian and Japanese so-called war criminals were conducted. Because these laws were one-sided, they could not form a new international law. Italy in particular did not join in this creation of special laws, and retained its prior regulations.

c) Post-1949 Restoration of the Original Principles

In those countries that had rescinded the tradition by which a commanding officer's orders exempted a subordinate from punishment, a return to the earlier principles was soon demanded. For example, in its verdict of June 29, 1951, against Lippert and others,¹²⁷ the Belgian court-martial in Liège rejected the criminal liability of the defendants because these had acted under orders. The Brussels court-martial came to a similar decision on March 9, 1951, in its verdict against General von Falkenhausen.¹²⁸

In the oath of allegiance demanded of its soldiers, the Russian armed forces exact a vow of unconditional obedience.¹²⁹ Further, the English Generals Montgomery and Robertson, the American General Clay and Admiral Blandy have stated clearly that a soldier must obey orders unquestioningly.¹³⁰ Thus, a French Captain who had acted on higher orders and had 10 foreign internees executed (in violation of international law) was acquitted; on the other hand, some Dutch soldiers were convicted because they had refused to carry out an unlawful order to burn down an Indonesian village.¹³¹

According to a newspaper report,¹³² J. E. Edmonds, one of the two authors of the British *Manual of Military Law*, stated that the 1944 revision of the *Manual* had been made without consulting or even notifying the author; the other author, Oppenheim, had already passed away at the time. Therefore, conversely, the information provided by Lord Hankey of the British House of Lords is not really surprising: namely, now that England has no so-called war criminals left to convict, the revision of 1944 has quietly disappeared from reprints of the *Manual of Military Law*, leaving only the old text of 1929, which does provide for the exemption of liability in the presence of higher orders.¹³³

In light of these circumstances we cannot agree with the view expressed in the American verdict in the Nuremberg SouthEast Trial,¹³⁴ that the civilized nations had increasingly espoused the principle that higher orders could not be claimed as defense against criminal acts. This court's opinion has already failed due to the military necessities of post-war times. Its implementation would have undermined all military authority. And this is why the latest

¹³³ Cf. Th. W. van den Bosch, *Tijdschrift voor Strafrecht*, Vol. LXI, p. 19.

¹³⁴ SouthEast Trial, *op. cit.* (note 11), Protocol, p. 10301.

(7th, 1952) edition of the well-known *Manual* by Oppenheim-Lauterpacht contains the following section:¹³⁵

“Given a reference to higher orders for purposes of justifying a war crime, a court must unquestionably consider that obedience to any not blatantly illegal order is the duty of every member of the armed forces, and that under the conditions of war-time discipline one cannot expect a subordinate to carefully weigh the legal basis of the orders he receives. It must also be considered that the norms regarding the conduct of war are often controversial, and that an act intended to serve as reprisal, though it might at other times constitute a war crime, can be carried out in obedience to orders.”

These conditions in and of themselves already suffice to rid the disputed action [Kappler’s and Priebke’s involvement in reprisal shootings, G.R.] from the stigma of a war crime.

As a result, the Nuremberg court’s attempts to revise the general principles failed. Therefore, under international law, orders issued by a responsible superior on principle preclude criminal liability on the part of the subordinate obeying the orders; the superior giving the orders is criminally liable for their implementation.

This restoration of the previous legal position must also be considered with respect to those war crimes for which sentence has already been passed – and reflected in a pardon, if necessary.

d) Liability of the Recipient of an Order in Exceptional Cases

There are individual exceptions to the general principle discussed here. In the passage quoted above, Lauterpacht acknowledges the exemption from punishment if the order given is “not blatantly illegal.” In Article 40 Section 4 of the Italian *Codice Penale militare di Pace* an exception is introduced to the principle of the superior’s sole liability, for the event that carrying out the order given does in fact obviously constitute a crime (*costituisce manifestamente reato*).¹³⁶ Article 18 Section 2 of the Swiss Military Criminal Code states that the subordinate is also criminally liable if he is aware that, by following the order, he contributes to a crime or misdemeanor. It is left to the judge’s personal discretion to moderate or dispense with punishment. Therefore, the subordinate has no clear-cut duty to evaluate his orders.¹³⁷ According to §47 Section 1 of the German Military Criminal Code, the subordinate obeying the orders was punished as participant in a criminal act if:

1. he went beyond the orders given him;
2. he knew that his superior’s orders pertained to an act whose aim was the commission of a general or military crime or misdemeanor.¹³⁸

If the subordinate’s share of the blame was minor, his punishment might be dispensed with.

e) Significance of Führer Orders for a Subordinate’s Exemption from Liability

During World War Two, Germany as well as other countries saw trends towards the limitation of exceptions to the general principles, and towards the introduction of strict discipline with a concomitant, absolute exemption from liability and punishment for the subordinate obeying orders. Today it is apparent that these views were wrong. But we must take into consideration the circumstances prevailing in those days in the “Führer state.” Since 1938, Hitler had been the Supreme Commander of the German *Wehrmacht*, and the highest Chief of the SS and the SD ever since their establishment. As a result, and in accordance with the

¹³⁵ Oppenheim-Lauterpacht, *op. cit.* (note 29), Vol. II, 7th ed., p. 569.

¹³⁶ Also, verdict of the American military tribunal in Nuremberg, Case IV, Protocol, p. 8087, cited in K. Heinze, K. Schilling, *op. cit.* (note 19), p. 126, No. 618.

¹³⁷ Cf. F. H. Comtesse, *Das Schweizerische Militärstrafgesetzbuch*, Schulthess, Zürich 1946, p. 59.

¹³⁸ Similar comments were made in the American verdict at Nuremberg in Case IV, Protocol, p. 8087. For the inconsistent punishment of subordinates obeying orders, cf. Jescheck, *Zeitschr. f. d. ges. Strafrechtsw.* 65, p. 123. [Editor’s remark: the only pertinent paper of that year by Jescheck I could locate is: Hans-Heinrich Jescheck, “Die strafrechtliche Verantwortlichkeit der Personenverbände.” *Zeitschrift für die gesamte Strafrechtswissenschaft* 65(2) (1953), pp. 210-225; hence, Siegert’s page number may be wrong.]

organization of an authoritarian state, he was able to give direct orders to any office or position he chose. In this context, the American verdict at Nuremberg in Case XII (*Wehrmacht Supreme Command Trial*) stated:¹³⁹

“Hitler’s personal decrees had the force of law.”

In Huber’s book *Das Verfassungsrecht des Großdeutschen Reiches* this was expressed as follows:¹⁴⁰

“The Führer consolidates within his person all sovereign power of the Reich: all public power in the state as well as in the Movement is derived from his leadership power [...] He is the carrier of all political power [...]. He is the highest carrier of all social functions [...].”¹⁴¹

This means that he could also give binding orders in individual cases, and these orders had the force of law. This was expressly confirmed by the Reichstag in its well-known decision of April 26, 1942.¹⁴² In other words, in deviation from the principle of the separation of powers, Hitler as head of state could give an individual order which required the same obedience as does a law in a democratic state.

From today’s perspective we must deny an authoritarian head of state’s order its force of law if this order violates natural right. In other words, when retrospectively assessing the legitimacy of an act from those days, we cannot content ourselves with the simple observation that it was done on the basis of an order from the highest chief of state. If such an order violated natural right, we cannot consider it legitimate, and carrying out such an order may be regarded as *unlawful*. But before we treat the carrying-out of the order as a *criminal offense*, we must in any case consider the application of the aforementioned (in d) §47, Sections 1 and 2 of the Military Criminal Code. Further, we must then also consider whether there may not also be other grounds for ruling out liability, either as typical or as individual case. Let us take a brief look at these issues in the following.

V. Errors and State of Emergency

a) Errors

Our analysis of the reprisal issue has shown that jurists from the various countries are by no means in agreement on what is permitted and what is not. Therefore, it is not surprising that military practice also varies in many respects. In view of the disagreement even between the subject experts, we cannot by any means expect soldiers to be clear on the issues of right and wrong as these pertain to reprisals and requisitions. Rather, in many cases where a court deems an act to be unlawful it is probably correct to assume that the defendant believed that his actions were legitimate. In other words, many persons charged with war crimes believed their actions to have been permissible, *i.e.*, they were not aware that they were unlawful.

Even in Germany there is much controversy about how someone who is unaware of the *unlawfulness* of his actions should be treated under the law.¹⁴³ It is beyond the scope of the present study to discuss this controversy in detail; suffice it to say that British and American criminal law do not require an awareness of the illegality of one’s actions.¹⁴⁴ In every case, however, it is important to determine whether the judicial system in question requires the affirmation of the guilt of a defendant. Articles 5 and 47 of the Italian Criminal Code, for example, permit the consideration of a non-criminal error on the part of the defendant. If a defendant believes his actions to be permissible, for example on the basis of a misinterpretation of the Hague Land Warfare Convention, then he must not be punished for a deliberate

offense. Under German law the element of intent would be inapplicable if, for example, someone charged with unlawful confiscations had erroneously believed that there was a pressing need for his actions, to serve the war effort.¹⁴⁵ These examples may indicate that the question of blame as pertaining to unlawful reprisals and requisitions must be of far greater significance than the post-war trials would in fact show.

b) State of Emergency

The *state of emergency* is an aspect particularly important to the cases dating from the last war. We have already pointed out the tendency for commanding officers to demand unconditional obedience from their subordinates. This was accompanied by a considerable tightening of law and justice as it pertained to military disobedience and insubordination. Someone who sought to act on natural right and an accordingly lack of obligation to the orders of the state leadership (cf. p. 545), and thus disobeyed an order from a higher source, would have had to expect a severe backlash and harsh punishment. Especially in the last years of the war these dangers were by no means vague; they were very immediate indeed. Since not only the threats of punishment were draconic, but the sentences passed were also very severe, anyone who had dared insubordination would have put himself in immediate danger of his life. Thus, such cases always represented a state of emergency, as according to §54 of the German Criminal Code. A soldier could therefore not have been expected to act in keeping with natural right. Though he was obliged to stand up to dangers in battle, he could not have been expected to willingly run the risk of execution for insubordination.¹⁴⁶ Therefore his conduct would have been exempt from liability as per §54 of the German Criminal Code.¹⁴⁷

VI. Summary

We have seen how a wide range of legal aspects bear upon an area of exceedingly practical significance and how international and national law, conventions and common law must all be considered in order to arrive at a just solution. In some respects, wartime saw a kind of intellectual confusion that did not allow for equal and balanced justice for all. The post-war years, and with them an increasing distance from the events of the war, provided the basis for a morally unexceptionable order. Reprisals were prohibited at the Convention of August 12, 1949, the theory and practice of requisitions have been reconciled, and the issue of higher orders has seen a return to principles that agree with criminal law *per se*. On the other hand, matters must also be put right for the past. First and foremost, it is necessary to subject the cases of our prisoners of war still detained today by our erstwhile enemies to a review guided by the reformed legal perspectives. The way in which these cases are dealt with shows whether the path is now clear for equal justice for all, and thus for a new European peacetime order.

* * *

Concluding Remarks by Germar Rudolf

German newspapers rarely carry articles about reprisals threatened or implemented by the western Allies at or after the end of the war. However, the *Stuttgarter Zeitung*, for example, reported that the French had threatened reprisal executions at a ratio of 1:25 even in the

¹⁴⁵ Cf. Erich Schwinge, *Militärstrafgesetzbuch, Kommentar*, 5th ed., Junker & Dünnhaupt, Berlin 1943, p. 302; Wenzelslaus K. M. M. von Gleispach, *Das Kriegsstrafrecht*, Teil II, Kohlhammer, Berlin/Stuttgart 1940, p. 13.

¹⁴⁶ Also, Lummert, *op. cit.* (note 40), pp. 55, 57f. – The International Military Tribunal in Nuremberg (*IMG*, Vol. XXII, p. 530) considered whether a choice in accordance with moral law was actually possible; similarly, the verdict of the American military tribunal of Nuremberg in Case VI, Protocol pp. 16172f., quoted in K. Heinze, K. Schilling, *op. cit.* (note 19), p. 113, No. 554.

¹⁴⁷ Cf. Siegert, *op. cit.* (note 114), pp. 44ff., and others. Regarding Italy we refer to Art. 54 of the *Codice penale*, and to Bettiol, *op. cit.* (note 114), p. 334. – The state of emergency was also examined by the American courts in cases V, VI, IX through XII; cf. K. Heinze, K. Schilling, *op. cit.* (note 19), pp. 111-117.

event that shots would be taken at their soldiers at all, regardless of the actual outcome.¹⁴⁸ On April 4, 1992, the *Paderborner Zeitung* reported an incident where the Americans had taken harsh revenge for the death of their General Maurice Rose, who had been shot in regular combat: 110 German men not involved in the event were killed.¹⁴⁹ Probably there are a great many more such examples, where harsh reprisals or unlawful acts of revenge were inflicted on the German population. We know very little today about conditions prevailing from 1945 to 1947, especially in West Germany, since these actions on the part of the victors were never prosecuted. The Germans were forbidden to prosecute because of a law that is still in effect today, and the victors, naturally enough, had no particular interest in such prosecution.¹⁵⁰ The fact that East and Central Germany saw some dreadful excesses is somewhat more fully documented, on the other hand, since this was in the interests of the anti-Communist western powers.

In light of the facts as established by Professor Siegert, reprisals and the execution of hostages might be considered tactically questionable and perhaps morally reprehensible, but strictly speaking these acts were not unlawful at the time they took place. This also should be ever kept in mind when the topic at issue is the reactions of German forces in Russia (and Serbia), *i.e.*, in vast regions where a weak occupation power had to battle brutal partisans in order to facilitate the oft-disrupted flow of supplies to the eastern front. Partisan attacks began immediately following the start of the eastern war; certain partisan units deliberately let themselves be overrun in order then to engage in sabotage behind the advancing German forces and to commit horrific atrocities against soldiers and civilians they caught unaware. Later on, partisan units as large as entire divisions were flown into the hinterland of the German forces, or smuggled in through the lines.¹⁵¹

Naturally, the data to be found in the subject literature about the numbers of partisans and the damage they caused vary widely, since there are few reliable documents about this kind of unlawful warfare, and because the Soviet Union also always had a strong propagandistic interest in the historiography of partisan warfare. The most-reliable data seems to be that provided by Bernd Bonwetsch,¹⁵² who gives the numbers of partisans as follows: late 1941: 90,000; early 1942: 80,000; mid-1942: 150,000; spring 1943: 280,000; by 1944, skyrocketing to approximately half a million. These figures are based both on Soviet and on contemporaneous Reich-German sources. The damage done by the partisans, especially in the area of Byelorussia, is considerably more difficult to quantify. However, Prof. Seidler's more recent investigations show quite clearly that the material destruction by the partisans – especially the destruction of supply lines in the years 1943/44 – can certainly be regarded as one of the main factors for the defeat of the *Wehrmacht* in the East.¹⁵³

Regarding the numbers of German soldiers and civilians killed by partisans, Bonwetsch contrasts the claims from Soviet sources – up to 1.5 million – with those from the German side: 35,000 to 45,000,¹⁵⁴ which he considers to be more reliable, since allegedly the German sources would have had no reason to minimize the figures. However, he overlooks the fact that it is generally customary in war to downplay one's own losses, and that on the German

Seidler, *Die Wehrmacht im Partisanenkrieg*, Pour le Mérite, Selent 1998, pp. 24-37; cf. from the Soviet perspective: Witalij Wilenchik, "Die Partisanenbewegung in Weißrußland," in Hans Joachim Torke (ed.), *Forschungen zur osteuropäischen Geschichte*, Vol. 34, Harrassowitz, Wiesbaden 1984, pp. 280f., 285, 288f. This chapter has a certain anti-Fascist undertone; on the disruption of German supply lines cf. S. Werner, *The Second Babylonian Captivity*, Castle Hill Publishers, Uckfield 2019, pp. 81-85.

¹⁵⁴ B. Bonwetsch, *op. cit.* (note 152), pp. 111f.

side, due to the chaotic war situation at the latest since mid-1944, there could no longer have been any reliable figures.

In the already-mentioned monograph on the partisan warfare in the East,¹⁵⁵ Prof. Seidler shows not only the disastrous and probably decisive effects of the partisan's attacks against German units and especially their supplies, but he proves also that most of the German reactions were totally covered by international law – although not always most far-sighted. Furthermore, he shows that those orders from higher up which broke international laws, were in most cases sabotaged by the front units, and that these orders, after long-lasting and massive protest, were eventually revoked.

In a book critically discussed by the renowned German historians Andreas Hillgruber and Hans-Adolf Jacobsen, Boris Semionovich Telpuchowski writes:¹⁵⁶

“Within three years of the war, the Byelorussian partisans eliminated approximately 500,000 German soldiers and officers, 47 Generals, blew up 17,000 enemy military transports and 32 armored trains, destroyed 300,000 railway tracks, 16,804 vehicles and a great number of other material supplies of all kinds.”

The data also diverge greatly regarding the personnel (and concomitant costs) involved in the Germans' efforts to maintain security behind the frontlines: 300,000 to 600,000 persons were needed according to Soviet sources, versus roughly 190,000 according to German sources.¹⁵⁴

To what degree these data were inflated in order to glorify the partisans is not known, but there is no doubt that the policy of *scorched earth*¹⁵⁷ practiced by the Red Army in their retreat in 1941-42, together with the acts of sabotage and murder by the partisans, were the major contributing factors in the defeat of the German army in the East. The brutality with which the Red Army and especially the partisans fought, right from the start of the war and on orders from the highest echelons, was described vividly by J. Hoffmann,¹⁵⁸ for example, and again by A.E. Epifanow¹⁵⁹ and particularly detailed by Franz W. Seidler,¹⁶⁰ after A.M. de Zayas had elaborated somewhat on this already in his 1979 study of the *Wehrmacht War Crimes Bureau*. In it, de Zayas confirmed and corroborated much of the material which the Reich government had already collected even in those days to document the atrocities committed by not only the Red Army.¹⁶¹ De Zayas also reports that the German wartime leaders did not resort to reprisals as a standard matter of course, but rather for the most part after carefully weighing the pros and cons. Especially in Russia, however, this could not prevent the fact that lower-ranking units, acting on the basis of their own horrible experiences with the Soviet manner of warfare, engaged in reprisals (and revenge) not ordered or approved by higher ranks.¹⁶² From July 1943 onwards, the German army and the SS even agreed to treat the partisans as normal combatants and to treat them as prisoners of war when taken prisoner,¹⁶³ a measure which, in its generosity and humanity, has never been encountered by an army before that or after, as far as I know.

¹⁶³ Franz W. Seidler, *op. cit.* (note 153), p. 127

As we know today, the German *Wehrmacht* deployed in the East fought not only for the survival of the Third Reich, but after they abandoned all illusions of imperialism, they also fought for the freedom of all of Europe from Stalinism,¹⁶⁴ and therefore, in light of Prof. Siegert's findings, we must observe that there was nothing unlawful and very little immoral about the merciless battle of the German security forces against unlawful Soviet partisans, even if that battle did involve draconic reprisals. If the official Soviet information about the numbers of German soldiers and/or their allies killed by partisans should be accurate, then it must be noted that reprisal killings of several millions of people (ratio 1:10) would have been *theoretically* justified. But even the numbers given by German authorities (some 40,000 victims) could have resulted theoretically in reprisal killings of about 400,000 civilians. It goes without saying that such numbers are horrific, and we can just be thankful that reprisal killings are forbidden nowadays and hope that the law will be observed. We must, however, ask whether such killings actually took place in those days.

The so-called *Einsatzgruppen of the Security Police and the SD (Security Service)* were among others the units in charge of combating the partisans.¹⁶⁵ They started with not more than 4,000 men in summer 1941, but at the end of 1942 up to 15,000 Germans and 240,000 natives were involved,¹⁶⁶ an increase of manpower which indicates very well the parallel increase of partisan warfare at that time. Considering their relatively unsuccessful efforts at curbing partisan activity, we must note that these initially numerically weak troops were obviously entirely overwhelmed by their task of policing the enormous region (many hundred thousands of square kilometers), which they were in charge of and whose more remote areas were increasingly under the control of partisans.¹⁶⁷ Thus it appears a bit ridiculous when H. Höhne states:¹⁶⁸

"Heydrich's death envoys started their cruel adventure: 3,000 men were hunting Russia's five million Jews."

Höhne omits to say that at the same time these troops were fighting against some 100,000 partisans. The allegations made against these troops today – namely, that, aside from their hopeless battle against the partisans, they also cooperated with many *Wehrmacht* soldiers to kill several million Jews as part of the Final Solution – beg the comment that, as Gerald Reitlinger says, this is absolutely unbelievable.¹⁶⁹ As mentioned in my introduction to the

¹⁶⁹ G. Reitlinger, *Die SS, Tragödie einer deutschen Epoche*, Desch, Munich 1957, p. 186; similar Efraim Zuroff, *Beruf: Nazijäger. Die Suche mit dem langen Atem: Die Jagd nach den Tätern des Völkermordes*, Ahriman, Freiburg 1996, p. 44, where he says that 3,000 men, "mobil killing units, whose task was to kill all Jews and communist officials in the area occupied by the Wehrmacht." This included the huge area "from the suburbs of Leningrad in the north to the Asov sea in the south.[...] Their weapons were conventional firearms. Nevertheless they succeeded in killing 900,000 Jews in 15 months." Zuroff wonders, but he has no doubts. This has been possible, according to Zuroff, because of the "fanatic support by the native population." (p. 47) That there has been a massive partisan warfare in the back of the fighting German army is either unknown to Zuroff or he is not interested in it; cf. I. Schirmer-Vowinkel, "In-

present book, German *Einsatzgruppen*-expert Hans-Heinrich Wilhelm opined on a number of occasions that the figures given in the various *Einsatzgruppen* documents are probably entirely unreliable,¹⁷⁰ which has been confirmed more recently by Italian historian Carlo Mattogno in his exhaustive study of the *Einsatzgruppen*.¹⁷¹

Aside from all this, I consider it possible and even likely that German units in the hinterland shot countless civilians in the course of the so-called “gang battles,” and primarily in the form of reprisal killings.¹⁷² Obviously, in selecting the victims of such reprisals, one would, wherever possible, not have chosen Ukrainians, Byelorussians or members of the Balkan, Baltic or Caucasian peoples, of whom considerable numbers fought in German units. The fact that the Jews were predominantly unpopular amongst these peoples was mainly due to fairly recent causes. In the two decades before World War II, many people had had terrible experiences with the Communist regime in general, and with the commissars in particular, disproportionately many of whom were of Jewish descent, especially in the first few decades of Soviet Bolshevism.¹⁷³ The Russian Jewess Sonja Margolina has made some interesting points regarding the involvement of the Russian Jews in the Bolshevik reign of terror:¹⁷⁴

“Nevertheless: the horrors of revolution and civil war, just like those of the repressions later, are closely tied to the image of the Jewish commissar.” (p. 47)

“The Jewish presence in the instruments of power was so impressive that even such an unbiased contemporaneous researcher as Boris Paramonov, a Russian cultural historian living in New York, asked whether the promotion of the Jews into leadership positions may perhaps have been a ‘gigantic provocation.’” (p. 48)

Margolina has written a particularly detailed analysis of a book which appeared in 1924 under the title *Rußland und die Juden (Russia and the Jews)*. This book examines the causes of the Russian Jews’ conspicuously above-average participation in the excesses of the October Revolution and the dictatorship that followed it, and analyzed the consequences of this involvement. In their appeal “To the Jews in all nations!” the authors of this book discussed by Margolina wrote:

“‘The Jewish Bolsheviki’s overeager participation in the subjugation and destruction of Russia is a sin that already bears within itself the seeds of its retribution. For what greater misfortune could happen to a people than to have its own sons engage in excesses. Not only will this be counted against us as an element of our guilt, it will also be held up to us as reproach for an expression of our power, for a striving for Jewish hegemony. Soviet power is equated with Jewish power, and the grim hatred of the Bolsheviki will transform into a hatred of the Jews [...] All nations and peoples will be swamped by waves of Judeophobia. Never before have such thunderclouds gathered above the heads of the Jewish people. This is the bottom line of the Russian upheaval for us, for the Jewish people.’” (p. 58)

Margolina quotes further from this anthology:

“‘The Russians have never before seen a Jew in power, neither as governor nor as policeman, nor as postal official. There were both good and bad times in those days too, but the Russian people lived and worked and the fruits of their labors were their own. The Russian name was mighty and threatening. Today the Jews are at every corner and in all

verser Verfolgungswahn”, *VffG* 2(1) (1998), pp. 63-68, here p. 64 (Zuroff’s book is also available in English: *Occupation: Nazi Hunter. The Continuing Search for the Perpetrators of the Holocaust*, KTAV, Hoboken, N.J., 1994).

¹⁷¹ C. Mattogno, *The Einsatzgruppen in the Occupied Eastern Territories: Genesis, Missions and Actions*, 2nd ed., Castle Hill Publishers, Uckfield 2022, pp. 243-292.

¹⁷² For the time between Jan. 1, 1943, and Oct. 31, 1944 (22 months), the German authorities have claimed 145,364 persons killed in the partisan warfare, 88,493 imprisoned, and 90,993 civilians “registered,” i.e., either sent into camps or otherwise punished; cf. F. W. Seidler, *op. cit.* (note 155).

¹⁷³ On this Jewish domination of revolutionary movements in Russia before, during and after the First World War, see e.g. Don Heddesheimer, *The First Holocaust*, 5th ed., Castle Hill Publishers, Uckfield, 2018.

¹⁷⁴ S. Margolina, *Das Ende der Lügen*, Siedler, Berlin 1992.

levels of power. The Russians see them at the head of the Czarist city, Moscow, and at the head of the metropolis on the River Neva and at the head of the Red Army, the ultimate mechanism of self-destruction. [...] The Russians are now faced with a Jew as judge as well as executioner; they encounter Jews at every step, not Communists who are just as poor as they themselves but who nevertheless give orders and take care of the interests of the Soviet power [...] It is not surprising that the Russians, in comparing the past to the present, conclude that the present power is Jewish, and so bestial precisely because of that.” (p. 60)

In the early 1990s, German historian Professor Dr. Ernst Nolte also pointed out the Jews’ intimate entanglement in Communism, though naturally he rejects equating the Jews with Bolshevism. Nolte wrote:¹⁷⁵

“For readily apparent social reasons, was not the percentage of persons of Jewish extraction particularly great among the participants in the Russian Revolution, different from the percentages of other minorities such as the Latvians? Even at the start of this century Jewish philosophers were still pointing with great pride to this extensive participation of the Jews in Socialist movements. After 1917, when the anti-Bolshevist movement – or propaganda – stressed the topic of the Jewish People’s commissars above all others, this pride was no longer expressed, [...] But it took Auschwitz to turn this topic into a taboo for several decades.

It is all the more remarkable that in 1988 the publication *Commentary*, the voice of right-wing Jews in America, published an article by Jerry Z. Muller who recalls these indisputable facts – though of course they are open to interpretation:

‘If Jews were highly visible in the revolution in Russia and Germany, in Hungary they seemed omnipresent. [...] Of the government’s 49 commissars, 31 were of Jewish origin [...] Rakosi later joked that Garbai (a gentile) was chosen for his post ‘so that there would be someone who could sign the death sentences on Saturdays.’ [...] But the conspicuous role of Jews in the revolution of 1917-19 gave anti-Semitism (which ‘seemed on the wane by 1914’) a whole new impetus. [...] Historians who have focused on the utopian ideals espoused by revolutionary Jews have diverted attention from the fact that these Communists of Jewish origin, no less than their non-Jewish counterparts, were led by their ideals to take part in heinous crimes – against Jews and non-Jews alike.’”

In his article, Muller quoted the statement by a rabbi which links the GULag with “Auschwitz”.¹⁷⁶

“The Trotskies make the revolutions [i.e., the GULag] and the Bronsteins pay the bills [in the Holocaust].”

What happened then, when the oppressed and terrorized Christians of the Soviet Union, of whom about 20 million had been killed by Soviet hands until 1941, were temporarily liberated by German tanks displaying Christian crosses – the *Wehrmacht Balkenkreuz* (cross of beams) goes back to the cross displayed by medieval crusaders on their shields – was a fulfillment of prophecies made many years earlier: bills were settled, pogroms erupted, revenge, hatred and retribution were given free rein in many places, sometimes supported or even triggered by the invading Germans, some of whom thought they had to settle their own bills.

It is therefore more than plausible, albeit often unjustified, that it was Jews, first and foremost, who were made to pay for the partisan warfare and for all the other Soviet crimes committed during peace time and war. Anyone who (rightly) criticizes this, however, should

¹⁷⁵ E. Nolte, “Abschließende Reflexionen über den sogenannten Historikerstreit,” in U. Backes, E. Jesse, R. Zitelmann (eds.), *Die Schatten der Vergangenheit*, Propyläen, Berlin 1992, pp. 83-109, here pp. 92f.

not omit to consider where the blame for this kind of escalation of the war in the East was to be found. And clearly it was to be found with Stalin who, as an aside, had treated the Jews in his sphere of influence at least as mercilessly ever since the war had begun, as Hitler had.¹⁷⁷ Of course, that does not tell us anything about the scope of such possible events. But as Nolte put it correctly (*ibid.*):

“But only Auschwitz has made the topic a taboo subject for several decades.”

And that hasn’t changed to this very day.

Gerhard Rudolf

¹⁷⁷ Regarding the question of the involvement of Jews in the soviet partisan warfare against German forces cf. E. Jäckel, P. Longerich, J. H. Schoeps (eds.), *Enzyklopädie des Holocaust*, Argon, Berlin 1993, p. 1348; cf. Nechama Tec, *Defiance: The Bielski Partisans*, Oxford University Press, New York 1993.

Appendix 1:

Wood Preservation through Fumigation with HCN: Blue Discoloration of Lime- and Cement-Based Plaster

HELMUT WEBER, WITH COMMENTS BY GERMAR RUDOLF

Water- and oil-based substances are not the only means for preserving wood; for a long time, wood has also been fumigated with toxins, such as hydrogen cyanide.

Hydrogen cyanide, or hydrocyanic acid, is a weak acid, which reacts with moist, very alkaline plasters through the process of neutralization: the product is calcium cyanide. The highly reactive cyanide ion combines with iron ions to form, among other things, the complex salt known as Prussian Blue. This is why, in the case of the architectural damage described herein, the iron-rich plaster became discolored blue.

Background

Approximately three years ago [1976] a church of average size was extensively restored. Aside from drying out the brickwork and removing salt deposits, a fumigation with hydrogen cyanide (of the Zyklon B type) was also performed. This method was used to treat parts of the gallery as well as the structural woodwork for the choir section, which had been infested by various wood pests. It is important to note that this method does not provide protection against reoccurrence; it is not a preventative measure and serves strictly to eradicate the pests already present.

In such fumigations, gaseous toxins are distributed throughout the space in question. They are left to react for an appropriate period of time, and then the space is aired out and the toxins are removed to the outside world. Of course, it is important that the facilities to be fumigated are sealed off as tightly as possible during the procedure.

In the case under investigation here, fumigation was carried out after the outside walls of the building had been dried out with an electro-osmotic device and after the plaster in the interior had been restored. In this context it is important to note that the plaster used was a porous hydrophobic kind with moisture-damming properties: such restoration plasters are characterized by low capillary water absorption and greatest possible permeability to water vapor; limit values may be set at $A \leq 0.3 \text{ kg/m}^2\text{h}^{0.5}$ and $s_d \leq 2 \text{ m}$. The plaster contained perlite as filler and, as later analyses showed, had a relatively high iron con-

Holzschutz durch Blausäure-Begasung

Blaufärbung von Kalkzement-Innenputz

Holz kann nicht nur mit wässrigen und öligen Systemen geschützt werden, seit langem wird Holz auch mit Giftstoffen wie z. B. mit Blausäure begast.

Blausäure ist eine schwache Säure, die durch feuchten, stark alkalischen Putz durch Neutralisation gebunden wird: es entsteht Calciumcyanid. Das sehr reaktionsfähige Cyanidion bildet mit Eisenionen u. a. das Komplexsalz Berliner Blau. Dadurch verfärbte sich im hier beschriebenen Schadenfall der stark eisenhaltige Putz blau.

120

Sachverhalt

Vor etwa drei Jahren wurde eine Kirche mittlerer Größe umfassend restauriert. Neben der Trockenlegung des Mauerwerks und einer Salzsanierung wurde auch eine Begasung mit Blausäure (System Zyklon B) durchgeführt. Dadurch sollten die von verschiedenen Holzschädlingen befallenen Bauteile der Emporen und das Obergestühl behandelt werden. Es sei vermerkt, daß sich ein vorbeugender Schutz mit diesem Verfahren nicht erzielen läßt. Es dient ausschließlich der Bekämpfung von Schädlingen.

Bei solchen Begasungen werden gasförmige Giftstoffe im Raum verteilt. Man läßt sie eine entsprechende Zeit einwirken und anschließend werden die Gifte durch Belüftung an die Außenwelt abgegeben. Wichtig ist natürlich, daß eine möglichst gute Abdichtung des Objektes vorgenommen wird.

Im vorliegenden Fall erfolgte die Begasung nach der Trockenlegung der Außenmauern des Bauwerks mit einer elektroosmotischen Anlage und nach einer Putzsanierung im Inneren. Wichtig ist in diesem Zusammenhang der Hinweis, daß für die Putzsanierung ein poren-gastrophober Putz mit dämmenden Eigenschaften eingesetzt wurde. Solche Sanierputze sind Putze mit möglichst geringer kapillarer Wasseraufnahme und möglichst hoher Wasserdampfdurchlässigkeit; als Grenzwerte können angegeben werden $A \leq 0,3 \text{ kg/m}^2\text{h}$ und $g \geq 2 \text{ m}$. Der Putz erhielt als Füllstoff Perlite und hatte,

wie spätere Analysen zeigten, einen relativ hohen Eisengehalt. Der Eisengehalt lag im Mittel über 1 Gew.-%. Der Putz war gebunden mit Kalk und Zement und war demzufolge stark alkalisch.

Der Zeitraum zwischen Neuverputz und Begasung betrug einige Wochen. Die Begasung wurde von einem Fachbetrieb durchgeführt, der bereits an mehreren hundert Objekten mit Erfolg tätig geworden ist. Es traten auch im vorliegenden Fall zunächst keinerlei Probleme auf. Nach der Begasung wurden die weiteren Arbeiten ohne Schwierigkeiten durchgeführt. Sie bestanden hauptsächlich in der farblichen Fassung verschiedener kunsthistorisch wertvoller Teile des Innenraumes sowie im Aufbringen eines neuen Farbenstriches auf den Putzflächen. Als Farbenstrich wurde eine reine Sumpfkalkfarbe verwendet.

Einige Monate nach der Übergabe des Bauwerkes traten – zunächst wenig beachtet – an einzelnen Stellen im neu verputzten Bereich kleine bläuliche Flecken auf. Man glaubte zunächst, diese seien auf Verunreinigung mit Tinte oder ähnlichem zurückzuführen. Die Flecken vergrößerten sich und in einzelnen Bereichen des Objektes traten Verfärbungen auf bis zu einer Größe von etwa einem Quadratmeter. Man stand dem Problem ratlos gegenüber. Die zu Hilfe gerufenen Spezialisten der einschlägigen Firmen konnten sich diesen Effekt nicht erklären, ähnliches war auch in der Literatur nicht beschrieben.

Illustration 2: First two pages of the quoted article, including a black-and-white photo of the patchy iron blue staining on the plasterwork of the Protestant church of Wiesenfeld.

tent, exceeding 1% by weight on average. The plaster was bound with lime and cement and consequently was highly alkaline.

Several weeks’ time elapsed between replastering and the fumigation. The fumigation was carried out by an expert firm, which had already successfully treated several hundred other facilities. And at first there were no problems in this case either. Following the fumigation, the remaining work was carried out without complications. The work consisted mainly of repainting various parts of the interior, which were of art-historical value, as well as of the application of a coat of paint onto the new plaster surfaces. The paint used was a pure lime-based paint.

Several months after the building was opened to the public, small ink-blue spots appeared at various places on the newly plastered surfaces. Little attention was paid to them at first; it was assumed that they were ink stains or the like. But the spots grew larger, and in some parts of the building discolored patches up to about a square meter (10 sq.ft.) in size developed. The persons in charge were helpless. The specialists who had been called in from the appropriate firms could not explain this phenomenon, and not even the subject literature contained anything pertinent.

Causes

It took chemical analyses of the plaster to determine the causes of this blue discoloration. These analyses confirmed the initial suspicion that the substance known as Berlin Blue had formed.

Chemically speaking, hydrogen cyanide (HCN) is a very weak acid. It is bound by damp, highly alkaline brickwork through neutralization. This produces calcium cyanide (Ca(CN)₂), for example:

The cyanide ion is a highly reactive ion, which joins with metals to form very stable complex salts. The best-known complex salts are the yellow and red iron cyanides. These compounds

form when iron ions combine with cyanide: with the iron(II) ion, the yellow ferrocyanide forms, and with the iron(III) ion, the red ferricyanide is produced:

In the presence of excess iron(II) or iron(III) ions, the yellow or red iron cyanide then reacts to form blue compounds which are described in the literature as Berlin Blue and Turnbull's Blue, respectively:

The formation of these compounds was what had caused the discoloration at the plaster's surface in the church. Conclusive proof of this was easily furnished. Spraying plaster surfaces which had not yet turned blue with a solution of iron(II) or iron(III) salts, respectively, produced a spontaneous blue discoloration, which otherwise would have formed only slowly, as the reaction progressed by itself.

Clean-Up and Restoration

A waiting time of about two years was allowed before attempts were made to rectify the damage, so that, quantitatively speaking, the reaction would have largely run its course. It turned out that even after one-and-a-half years new blue discolorations still formed in some places. Clean-up and restoration themselves are costly; all the new plaster that was applied must be removed again. This is all the more regrettable because it necessitates protective measures for all wood paneling in the gallery and for the organ, since otherwise the dust generated by the clean-up activities would inevitably do damage.

After the plaster has been removed, a new plaster as free of iron components as possible will be applied. Either a lime-based mortar or a so-called restoration plaster may be used. After the plaster has hardened, the entire interior must be color-matched to the remaining parts of the church. This is always problematic, since all paints – even lime-based paint – undergo a certain aging process, and mixing the paint to match the ground color present will likely prove difficult.

It is safe to assume that the problem will then be cleared up and that no new blue discolorations will appear. In the areas still bearing the original plaster, i.e., in the upper regions of the church, this is not to be expected anyhow, since the alkalinity required for neutralizing the hydrogen cyanide is not present there.

An easier clean-up method, i.e., a conversion of the blue patches into colorless compounds, is not possible by any common chemical means.

Commentary

It goes without saying that fumigations involving highly toxic substances must be performed only by expert contractors with the appropriate training and licenses. During the treatment the premises in question are kept under guard so that no unauthorized persons can enter them. Despite the toxicity of the substances involved, no accidents have been reported to date. Cases of damage to the facilities themselves have also been very rare. One spectacular case of such damage was reported for the first time in 1974, by Grosser and Roßmann.

But despite being highly uncommon, this report of damage also shows how difficult it is for an architect to use chemicals in construction. Plasters and paints must also be considered from a chemical perspective because, as clearly demonstrated by the present case, it is the combination of various factors which ultimately does the damage. It is suggested that in similar cases of fumigation, an appropriate construction-chemical investigation be conducted first to determine whether discolorations such as were the case here might result. The alkalinity and the iron content of the brickwork or plaster are factors requiring particular attention.

Grosser, D., and E. Roßmann: "Blausäuregas als bekämpfendes Holzschutzmittel für Kunstobjekte," *Holz als Roh- und Werkstoff*, Vol. 32 (1974), pp. 108-114.

The preceding account was published on pages 120f. of volume 4 of the series *Bauschäden Sammlung. Sachverhalt – Ursache – Sanierung*, edited by Günter Zimmermann, published in 1981 by Forum-Verlag, Stuttgart, Germany.¹ A more recent review about damages caused by HCN fumigations, including further cases as here described, was published in 1995,² and another, strikingly similar case, not mentioned in expert literature, had occurred five years earlier in 1972 in the Catholic church of St. Michael in Untergriesbach, Bavaria. Here, too, the church had been recently refurbished with fresh plaster, which turned blue after the church had been gassed with Zyklon B to combat woodworms, just as it happened in Wiesenfeld five years later.³

These striking examples ought to suffice to refute any objections to the effect that, for chemical reasons, no long-term-stable cyanide compounds could have formed in the walls of those Birkenau crematoria that are termed gas chambers, and that there must be a different explanation for the large quantities of cyanide that are to be found in the camp's delousing facilities, evidenced by the patchy-blue discoloration of the plaster there.⁴

The fact that the expert literature is unaware of more such damages caused by HCN might have mainly three simple reasons:

1. The first fumigation of a building or room normally takes place only after it has been used for quite a long period, *i.e.*, years, since new buildings are usually not vermin-infested. Therefore, the plaster of the fumigated walls is usually carbonized, *i.e.*, no longer alkaline and thus not liable to accumulate high amounts of cyanides after only one fumigation.
2. Normally, a building is fumigated only now and then, *i.e.*, hardly ever more than once a decade or even longer periods of time.
3. Furthermore, a room to be fumigated normally is at least fairly dry as it is required by the legal regulations and operational instructions. But humidity is required for the accumulation of cyanide and its chemical conversion into long-term-stable compounds.

Before we compare the case described in the previous article with the circumstances in Auschwitz and Birkenau, we must point out that, despite affirmations to the contrary, accidents have indeed happened in the course of HCN fumigations of buildings. As in any commercial activity, accidents do occasionally happen here as well.⁵ The sweeping claim that highly alkaline plaster is the only kind to combine with hydrogen cyanide is also untrue. While a high degree of alkalinity does facilitate the rapid absorption of large quantities of HCN, slightly alkaline or even neutral plasters can also accumulate considerable quantities over time, as the HCN delousing chambers in Majdanek show (cf. the contribution by Carlo Mattogno on Majdanek in this volume).

It is interesting to compare the case described here with the alleged gas chambers in Crematoria II and III (in each case, Morgue 1) of Birkenau, on the one hand, with the delousing facilities of Buildings 5a and 5b on the other. These have already been described in detail in my contribution on the Auschwitz gas chambers (this volume).⁶ See the separate table. The

* = assuming the correctness of the alleged mass-gassing scenarios			

iron content of the plasters in Birkenau was determined by Gernar Rudolf as documented in his report.

The alkalinity of the plasters in the mortuaries of the crematoria will have been similar to that in the church described previously, since in both cases the plasters were cement-based, which are clearly alkaline in the long term. Judged by its consistency, the plaster in the delousing facilities is a lime-based mortar and therefore was probably strongly alkaline only in the beginning – which may have sufficed to form reasonable amounts of iron blue if fumigations started right away after the plastering had been finished.

Despite the fact that the temperature is generally low in churches, and that as a result plasters there usually have a high moisture content, the plaster in the church in question was likely only moderately damp due to its hydrophobic (water-expellent or -repellent) consistency. The walls of the [underground] unheated Morgues 1 of Crematoria II and III of Birkenau, on the other hand, would have been very moist, especially if one assumes mass gassings to have been a fact (condensation of body moisture on the cool walls). On the other hand, the delousing facilities of Buildings 5a/b, which were located above the ground and were equipped with heating systems, will have had dry and warm walls, except perhaps the external walls on cold (wintery) days.

Since Crematoria II and III were built in the winter of 1942-43 and were allegedly put into operation as mass gassing facilities right away, in spring 1943, a time period of between a few weeks and up to three months would have elapsed between the time of completion of the plasterwork and the time of the first fumigation – just as much as, or a bit more than, in case of the church. The time between the completion of the delousing facilities and the first fumigation is unknown, but it was likely no more than a few days, since the disastrous hygienic situation in Birkenau must have urged the SS to operate these facilities as soon as they were finished.

Therefore, the only significant differences between the Birkenau mortuaries and the fumigated church was the higher moisture content of the mortuaries’ walls and the possibly longer time gap between completion and start of operation in case of the mortuaries. Both factors are likely to compensate each other. Thus, one would have to expect a similar tendency to form long-term-stable cyanide compounds in both cases. But we cannot find any significant cyanide residues in the morgues claimed to have been homicidal ‘gas chambers’!

If one tried to maintain a theory of mass gassings in those morgues, despite the actual state of affairs, which is clearly contrary to what one would have to expect under the exterminationist hypothesis, then one is indeed forced to go against eyewitness claims and to minimize the number of gassings, to greatly reduce the quantities of poison allegedly used, and to

cology of Zyklon B and the Gas Chambers. A Crime-Scene Investigation, 4th ed., Castle Hill Publishers, Uckfield 2020.

decrease the application time to a technically absolutely impossible level – while disregarding entirely the lack of any means for introducing the poison gas substance into the rooms, and also disregarding entirely the paradox posed by the alleged gas chambers of Majdanek and Stutthof, where huge amounts of iron blue did form, due to alleged homicidal gassings, as some want to make us believe. In actual fact, these facilities in Majdanek and Stutthof were never anything else but simple, straightforward hydrogen-cyanide delousing chambers (compare the contribution by Carlo Mattogno on Majdanek, this volume).

Appendix 2: Expert Opinion

JOACHIM HOFFMANN

Preamble

Accredited chemist Germar Rudolf-Scheerer^[1] has written me to request an expert opinion regarding an anthology titled *Grundlagen zur Zeitgeschichte: Ein Handbuch über strittige Fragen des 20. Jahrhunderts*,^[2] edited by Ernst Gauss [=pen name of Germar Rudolf] and published in 1994 by Grabert-Verlag in Tübingen, Germany. The foremost issue was to be the question of the work's scientific, *i.e.*, academic nature, rather than the content *per se*.

As an historian specializing in recent and East European history, and on the basis of my decades of professional experience and practice in the academic service of the Federal Republic of Germany, I am qualified and entitled to give an expert opinion on the matter in question.

Regarding my personal qualifications, I wish to state that I was a member of the Militärgeschichtliche Forschungsamt [Centre for Research in Military History] in Freiburg from 1960 to 1995. For almost three decades my work has focused exclusively on matters related to the German-Soviet war. Through the publication of academic books and periodical articles on this topic I am well established as an expert in my field, both at home and abroad. Accredited chemist Rudolf-Scheerer and the co-authors of the anthology at issue are not personally known to me.

The Formal Aspect

As pointed out in the anthology in question, the book does not offer a comprehensive overview of the course of the National-Socialist persecution of the Jews during World War Two. Rather, the focus is on specific individual topics regarding disputed and controversial aspects of killings of the Jews. The various contributions to the book are expertly written in a predominantly investigative style. Where detail and completeness are concerned, the body of supporting and documenting references leaves little to be desired and is extremely helpful to a reader seeking further information, not least of all since sources from the opposing subject literature are also cited without reservation. It appears, therefore, that this anthology is part of the large-scale academic dispute over a serious contemporary issue which reaches far beyond its actual academic scope and into the political realm.

The individual contributions to this anthology are logically consistent and objectively descriptive in structure, even though at times a polemical note does become evident – as is perhaps inevitable in such emotionally charged topics, and as is also quite common in political and historical controversies. In any case, a striving for new understanding is tangibly apparent throughout the book. From this perspective, therefore, the anthology cannot be denied an academic character, particularly if one compares it with many a publication from its opposing side, whose academic nature is also never questioned. There is much in the various contributions that strikes one as thoroughly convincing. Much else may be merely noted with objective interest. Elsewhere, doubts and criticisms also come to mind. The issue may perhaps be simplified by pointing out that what we are dealing with in this great controversy is a rather more accusatory style of literature on the one hand, and a rather more apologetic one on the other. This is to suggest that in the heat of controversy, both sides may be overly inclined to overshoot the mark and to leave the solid ground of provable facts behind. One

¹ Scheerer was the last name of Germar Rudolf's first wife. He carried that name from 1994 through 2002, when he reverted to his birth name Rudolf.

² This is the original German title of the present volume, translating to "Foundations of Contemporary History: A Handbook on Disputed Issues of the 20th Century".

might perhaps summarize by saying that the time for conclusive declarations regarding the great persecution of the Jews has not yet come.

The Problem of Self-Evidentness

There can be no doubt about the fact that genocide was committed against the Jewish people by the *Einsatzgruppen* of the Security Police and the SD and by the SS personnel in charge in the concentration camps in the former General Government of Poland. Hitler, Himmler and Dr. Goebbels clearly admitted these misdeeds on several occasions. The anthology's editor, Ernst Gauss, also considers this as given in his chapter. And in fact, the genocide provides an unspoken backdrop for the anthology at issue. To rule out any misunderstanding, it would perhaps have been better to spell these things out unambiguously and to clarify that an academic controversy today can no longer dispute the mass killings per se, but rather only the numbers of victims and the methods of murder. In this respect, we admittedly may expect to see far-reaching modifications as yet. In this context as well, the rather overused concept of self-evidentness is in need of limitation, or at least of a more precise definition.

Two Important Examples

We shall give two especially significant examples of this.

1) [Downward Revision of the Number of Auschwitz Victims]

From 1945 to 1990, the figure of 4 million victims in Auschwitz was considered self-evident and was accorded judicial notice in the Federal German courts. But where did this figure come from? It originated with Soviet war propaganda. On March 1, 1945, an official Soviet announcement stated for the first time that “at least five million people were exterminated” in Auschwitz. This figure was then reduced to four million in the official Soviet communiqué of May 7, 1945. This number of 4 million victims – put about by Soviet war propaganda, in other words by the NKVD, and in no way proven by any evidence whatsoever – was adopted by the public in western countries, and persisted unchanged until 1990, when it was officially reduced to 1.5 million virtually overnight. Currently the number of Auschwitz victims is set at a remaining 631,000 to 711,000, and a further reduction has not been ruled out.

2) [The Total Number of Jewish Victims]

To this day the total number of Jewish victims is generally given as 6 million. According to the current opinion of the German experts on contemporary history, this figure was first provided to the Americans by SS *Sturmbannführer* Dr. Hoettl in spring 1945, and repeated at the IMT in Nuremberg on November 26, 1945. It must be noted, however, that this self-same figure was demonstrably first put forth in the foreign press as early as January 4, 1945, several weeks prior to the January 27, 1945, liberation of the Auschwitz concentration camp (with its alleged 4 million victims) – put about by none other than the infamous Soviet Minister of Propaganda, Ilya Ehrenburg. Thus, it was Ehrenburg who came up with the figure of six million.^[3]

Regarding Ehrenburg himself, it must be mentioned that in 1941 Stalin had given him the general order to incite a boundless national and racial hatred against all Germans. Ehrenburg's years-long unbridled frenzies of hatred culminated in his call to “put an end to Germany” and in an effort which he described as “modest and honorable,” namely “to reduce the population of Germany,” towards which end the only thing left to decide was whether it would be better “to kill the Germans with axes or with clubs.”

³ Cf. Joachim Hoffmann, *Stalin's War of Extermination 1941 – 1945*, Theses & Dissertations Press, Capshaw, Ala., 2001, pp. 189f. In fact, the six-million figure is much older than that. It goes back to Zionist propaganda that started being spread around the turn of the 19th to the 20th Century, hence even before the FIRST World War; cf. Don Heddesheimer, *The First Holocaust*, 5th ed., Castle Hill Publishers, Uckfield, 2018.

Illustration 1: Joachim Hoffmann, Dr. phil., born 1930 in Königsberg, East Prussia; studied modern history, eastern European history and comparative ethnology at the University of Hamburg and Berlin's Free University. He received his PhD in history in 1959. Between 1960 and 1995, he was historian at the *Militärgeschichtliches Forschungsamt der Bundeswehr* (Research Department for Military History of the German Army). His field of expertise was "Armed Forces of the Soviet Union"; Dr. Hoffmann has authored numerous articles and books about political, diplomatic and military history of the 19th Century and about the history of the German-Soviet war. In 1991, he was granted the "Dr. Walter-Eckhardt" Award, and in 1992 the "General Andrej Andrejewitsch Wlassow" Cultural Prize. He died in February 2002.

Both examples show that new evidence can immediately overthrow something that is allegedly self-evident, and, accordingly, it is the duty of any contemporary historian to call allegedly conclusive findings into question. Even in matters involving grave charges, the principle of self-evidentness has been known to become invalidated. As an example, one need only consider the claim (widely accepted in Germany in particular, but now denied by Yad Vashem itself) that the Germans had manufactured soap from the bodies of murdered Jews – a fabrication that also goes back to Soviet war propaganda. Therefore, the anthology at issue here does not commit anything unlawful, but rather engages in a justified and necessary pursuit in its attempt to critically examine allegedly self-evident issues on the basis of new evidence or findings, as it is in fact the natural task of historiography to do.

The Problem of Eyewitness Testimony

Several contributions to this anthology point out, and rightly so, that the testimony of eyewitnesses is unreliable; these contributions back their claims with numerous examples, some of which are indeed truly grotesque. Such experiences certainly agree with those of other historians of the Second World War. This is not to say that eyewitness statements are entirely superfluous, but practical experience definitely has shown that they must always be examined and corroborated with authentic documents. My personal experience has been that as early as 1970 eyewitness testimony about details of the events of the war was so unreliable that it would have been a breach of professional duties to base a historical treatise on them alone.

Benz's Anthology

On the whole, the contributions to the anthology here at issue frequently manifest a profound understanding of the subject and its associated literature, even though some suggestions made do appear questionable at times. However, the establishment literature about the Holocaust also often contains factual errors. One example in this context is Benz's 1991 anthology *Dimension des Völkermords*, which displays a downright disarming ignorance of the state of affairs on the Soviet side. The authors of the Gauss anthology object, and correctly so, that Benz bases his studies uncritically on the announcements made by Soviet war propaganda and on the publications about Soviet show trials. The anthology edited by Benz attempts, by means of elaborate statistical minutiae, to prove the correctness of the six-million figure. Anyone who has worked with demographic statistics knows what serious errors can enter into such complex analyses even under a strictly objective agenda. Benz is entirely unaware that Ehrenburg had already introduced the six-million figure into the annals of war

propaganda on January 4, 1945. Thus, he will have to accept the charge that, though unwittingly, he has really only worked to confirm a propaganda figure of Ehrenburg's. From this perspective, his and his co-authors' research findings offer a foothold for fundamental criticism.

Babi Yar

The mass execution of Jewish inhabitants of Kiev, known as the massacre of Babi Yar, is also subjected to justified and necessary criticism in the anthology here at issue. Over time, the actions of Einsatzkommando 4a of the Security Police and the SD under Blobel have experienced propagandistic inflation to the point where restoring the actual facts to their real dimensions is an obligation for anyone striving for historical veracity. Of course, this does not impinge on the fact that thousands of Jews were killed in Kiev.

Overall Impression

The overall impression evoked by this anthology edited by Gauss is that its contents must be acknowledged – with critical common sense, of course – no less than is always undisputedly and unrestrictedly done with the 'official' literature about the Holocaust. The principle of *audiatur et altera pars* [let the other side be heard] must apply in this case as well! A suppression of this carefully documented work would represent a forcible obstruction of the legitimate striving for scientific and academic understanding. The state of knowledge is never static. Experience has shown that exaggerations and errors always grind themselves down in the course of a normal academic controversy. One must not deny a mature and free researcher and reader his ability to exercise his critical faculties. It would then be only a small step from suppressing unpopular books, to burning them; and then, though with different motivations, we would be right back where the entire misfortune began.

Conclusion

As historian officially commissioned by the Militärgeschichtliches Forschungsamt I have spent two-and-a-half decades studying the Soviet military literature about the history of the Red Army and the Second World War in its original documental texts – an endless chain of misrepresentations, fabrications, distortions and slander. But even this historical literature turned up the occasional truths. I could not have carried out my academic duties if I had rejected the Soviet publications out-of-hand as being unacademic. The same goes infinitely more for the anthology here at issue, which is on a respectable academic level and which doubtlessly contributes much to our understanding of aspects of the war, despite any reservations one may have.

Another expert opinion about the original, 1994 German edition of the present volume was authored in 1995 by Prof. Dr. Ernst Nolte, back then professor of modern history in Berlin. I did not receive a copy of this expert report until my second trial was pending in 2006. I

Illustration 2: Cover image of the original, 1994 German edition of the present book.

subsequently published it in my autobiographical account of that trial, where it can be read, together with an update by Nolte on my later literary activities, and an analysis of Nolte's elaborations by me.⁴

All these efforts to prove the legitimacy of the present's book's scholarship was futile, however, because on June 15, 1996, Judge Burkhardt Stein from the Tübingen County Court ordered the confiscation and incineration of all copies of the present book and the destruction of all means for manufacturing them (Ref. 4 Gs 173/95). The expert reports presented by the defense were simply ignored.

Germar Rudolf

⁴ G. Rudolf, *Resistance Is Obligatory*, 2nd ed., Castle Hill Publishers, Uckfield 2016, pp. 263-304. This book also contains another historian's expert opinion on three of my books: Dr. Olaf Rose's take on the books *Dissecting the Holocaust* (1994 German edition), *The Chemistry of Auschwitz* (2001 German edition) and *Lectures on the Holocaust* (2005 German edition); *ibid.*, pp. 256-262.

Appendix 3: First Reactions to this Book

GERMAR RUDOLF

In the spring of 1994, several leading personalities and institutions of Germany received a preliminary typescript of the present book from me. The recipients were primarily asked to assess whether this work complies with scholarly standards, for which I suggested as guidelines the criteria established by Germany's Federal Constitutional Court as set out in the introduction to this book. In addition, they were also invited to submit any criticism and suggestions to improve the contents of the book. Some reactions are listed below. Since the letters I received in response were confiscated on August 18, 1994 by the police during a house search in an unrelated case against others, I tried reconstructing the contents of these letters from memory. In case of errors, I may ask the persons concerned for leniency and ask them to approach the public prosecutor in Stuttgart for indemnification.

German Federal Chancellor Dr. Helmut Kohl

Through a clerk, German Federal Chancellor Helmut Kohl informed me that he cannot get involved in the ongoing discussion about the Holocaust while referring to case law of the Federal Constitutional Court and the Federal Supreme Court on the Holocaust issue. On the basis of the many handwritten annotations and corrections added to the galley proofs sent back to me, for which I would like to express my gratitude in the name of all authors, it could be inferred, however, that the Federal Chancellery thoroughly read the introductory article and read the other contributions at least cursorily.

President of the Central Council of Jews in Germany, Ignatz Bubis

Mr. Bubis accepted the typescript without any feedback.

President of the *Institut für Zeitgeschichte*, Hellmuth Auerbach

The government-run *Institut für Zeitgeschichte* (Institute of Contemporary History) in Munich refused to accept my letter, sending it back unopened. Since ignoring – in this case only presumed! – counter-arguments is absolute proof of an unscientific attitude, one cannot refrain from denying the official Institute of Contemporary History the scientific nature of their utterings with respect to the Holocaust.

Prof. Dr. Michael Wolffsohn

Prof. Wolffsohn kept the typescript and wrote back that we, too, could not dispose of facts, which is undoubtedly correct. The only question in this matter is: what are facts and what is only faith?

Prof. Dr. Dr.h.c. Hans Georg von Schnering

My PhD supervisor sent back the unread typescript, forbade me to send him anything in the future, and emphasized that he did not want to be dictated by which criteria he had to judge the scientific character of a paper. He evidently overlooked the fact that the criteria recommended as a guideline were not selected arbitrarily, but were those of the German Federal Constitutional Court. His hostile attitude otherwise fits in perfectly with what he had demonstrated to me during the previous two years: Prof. von Schnering refused to acknowledge arguments that might contradict his view.¹ Since he told me at the time that anyone ignoring

¹ I have briefly described my altercations with my PhD supervisor in: G. Rudolf, *Kardinalfragen an Deutschlands Politiker*, 2nd ed., Castle Hill Publishers, Uckfield 2012, pp. 45f.

arguments that contradict their own thesis is not worthy of an academic title, he has thus passed a harsh judgment about himself.

German Attorney General Kay von Nehm

The Attorney General was not asked for a substantive criticism, but rather to determine whether and if then why the present typescript violates any criminal law. Herr von Nehm stated in his reply that already the table of contents reveals the typescript as a vicious concoction, and that he does not intend to take notice of it. He also made it clear that his statement does not include any legal evaluation of the typescript. With this letter of the Federal Attorney General, the bias and boundless ignorance of Germany's public prosecutors has been demonstrated sufficiently, with which they have lost any moral right to legally assess the present book.

Several Professors of Various Fields of Study

Several university professors actually submitted some factual assessments and constructive suggestions, for which I may express our heartfelt gratitude. For understandable reasons, I will not spell out the names of these helpful scholars. One opinion was, for example, that most books on contemporary history are easy reading in comparison to our book. One point of critique was that in our volume only some aspects of the Holocaust are criticized, but that we have largely neglected to counterpose the established narrative with a comprehensive account of the National-Socialist persecution of Jews from the revisionist point of view. It is not enough, it was opined, to complain about certain details of traditional historiography. If the events did not unfold as we are commonly told today, one has to show how else they unfolded. To that I would like to reply that the first step in science, when critically reviewing a prevailing view, is always to check whether, and if so, then why, the prevailing view has decisive shortcomings. In the beginning, therefore, is the examination of the old narrative, which can lead to its destruction. If the old thesis has been successfully challenged, then it has been demonstrated that there is a need for research to construct a new narrative.

The present book takes the first step, the examination and criticism of the old narrative. We are convinced that this old narrative did not withstand our criticism. There is therefore a need for research to develop a new, more correct historical narrative. Sketching out such a new, comprehensive, more truthful narrative could not and should not be accomplished by the present book. This task must be reserved for subsequent works. Their task will be to shed light on the relationship between Jews and Germans in the 20th Century from a holistic perspective.

Germar Rudolf, Jettingen, September 1994

HOLOCAUST HANDBOOKS • VOLUME 1

Blue staining of delousing chamber walls, as a result of exposure to Zyklon B: Majdanek (top left), Auschwitz-Birkenau (top right), Stutthof (bottom left). No staining can be found in the ruins of the Morgue No. 1, the alleged homicidal 'gas chamber' located in the former Crematorium II of Auschwitz-Birkenau (bottom right).

Dissecting marshals the work of more than a dozen researchers to subject the “gas chambers,” the “six million,” the postwar trials and other linchpins of the orthodox Holocaust narrative to careful, precise, methodical and withering analysis. Robert Faurisson, Germar Rudolf and Claus Jordan on how testimony was coerced and convictions manufactured; G. Rudolf on the evidence for Jewish losses during WWII; Udo Walendy and John Ball on analysis of photos alleged to depict the crimes or their locations; Jürgen Graf on myths about the concentration camps; Germar Rudolf on how chemical analysis gravely weakens the case for gassing in the Auschwitz gas chambers; Carlo Mattogno on the cremation furnaces of Auschwitz; Fritz Berg, Ingrid Weckert, Carlo Mattogno and Arnulf Neumaier on the technical and evidentiary absurdities of gassing claims for German trucks and gas chambers at Majdanek, Belzec, Sobibor and Treblinka; and more. *Dissecting*'s handsome design and format lend themselves well to the numerous illustrations, charts, and diagrams with which these leading revisionists advance the wealth of evidence the book offers against the Holocaust myth. 3rd revised and updated edition of 2019.

“[...] it is questionable whether one should accept improbable figures supplied by a not overly friendly source.”

— *American Jewish Year Book*, 1972, Vol. 73, p. 536,
on the Soviet Union being engaged in making Soviet
Jews disappear statistically

Foreword

It is an understatement to say that the study of 20th century Jewish population changes presents us with irresolvable problems, but there is much that can be reliably observed. The principal background developments were the rise of Zionism as a significant international political force and the rise of anti-Jewish movements in Europe, notably in Germany. Implicit in both developments were policies, however differently motivated, that would have relocated European Jews in great numbers. Indeed this common objective was the basis for a not negligible amount of cooperation between Zionist and German authorities in the 1933-1939 period.

Other background developments were the adoption of pro-Jewish policies by the USA and the USSR, the latter maintaining those policies through 1948 (the year of Israel's establishment). These victors in World War II continued, also from various motivations, processes of relocating Jews that had been carried on by Germany, while Germany in turn had not been the first in the field, as large relocations of Jews had been carried out earlier under Zionist and Soviet auspices.

As these massive movements subsided to trickles in the postwar period, the broad outlines of what had happened were clear. Jewish communities had drastically shrunk or even virtually disappeared in much of central and eastern Europe, particularly Poland. Correspondingly, there had been great transfers of Jews to Palestine, the USA and other countries, employing means provided by Jewish organizations or by the U.S.-controlled UNRRA, whose Directors had been New York Zionists Herbert Lehman and Fiorello LaGuardia. There had also been a large dispersion of Jews, especially Polish Jews, into the Soviet Union. Thus the excellent title of this book.

While such broad outlines were clear, many details remain obscure, shrouded or inaccessible. Particularly troublesome are quantitative aspects. We do not know how many were absorbed into the Soviet Union, how many emigrated to the USA or other specific countries, or how many remained or resumed living in central or eastern Europe, and the not insignificant number of those who perished has not been firmly reckoned. On the last matter, only propagandists and uninformed people come forward with a purportedly accurate number.

Reasons for this ignorance are not difficult to give. The movements of Jews through the UNRRA camps were camouflaged as much as was possi-

ble under the circumstances, for the excellent reasons, among others, that the subsequent movements to Palestine were illegal and in any case UNRRA was supposed to be for “United Nations Relief and Rehabilitation” in a war ravaged continent, not for conquest of non-European territory by indigenous European populations.

Useful data on postwar migration and resettlement is difficult to impossible to obtain. Since 1943 the U.S. Immigration and Naturalization Service has made no attempt to count immigrant Jews as such, and Soviet-dominated eastern Europe does not welcome foreign or scholarly curiosity on politically sensitive matters.

Census data is not of much help. In the USA, which is today the leading center of Jewish population, “Jews” are not a category for census purposes, and indeed Jews do not like being counted. The ongoing controversy in Britain on this point is a current illustration of this aversion.¹ The Soviet census attempts to count Jews, but the procedure of the census takers is to accept the word of individuals on this question. When to that observation is added the aforementioned Jewish aversion (operating in a state-encouraged climate of anti-Zionism) and the usual skepticism appropriate to evaluating Soviet claims, the Soviet census figures are seen to be of little value. Jewish spokesmen in the West claim that the Soviet figures are unrealistically low.²

To these considerations should be added the difficulty of producing an operationally useful definition of a “Jew.” This is an especially grave problem in western liberal democracies, on account of the large extent of intermarriage and the larger extent of religious apostasy.

This book jumps squarely into the uninviting waters of 20th century Jewish demography and migration and attempts to reconstruct these Jewish population changes, especially in their quantitative aspects. One immediate consequence of this choice of subject is that the person looking for light reading is advised to look elsewhere; this book is difficult to read even for somebody who is accustomed, as I am, to reading texts with high quantitative components. Another consequence is that the reader looking for final and definitive answers to “how many?” type questions, as distinct from at best provisional estimates, will be disappointed. There is scarcely an estimate arrived at in this book that cannot be challenged on some plausible grounds.

Such limitations of this book are not the author’s fault. There is no way his subject can be served adequately with easily readable text, and there is no way to determine the more important numbers involved with the accu-

¹ *Jewish Chronicle*, 28 Dec 79, p. 5; 7 Mar 80, p. 9; 11 Feb 83, p. 4; *Patterns of Prejudice*, Jan 80, pp. 24+.

² *American Jewish Year Book*, 1981, pp. 239f.

racy and reliability of, say, a total population census in a contemporary western country. The author is well aware of such constraints and limitations, and specifically cautions the reader that one vitally important estimate “has no claim on absolute certainty.” If I were to select only one respect in which I wish the author had done something differently, it would be that I wish he had been more emphatic on the rather tentative nature of most of the quantitative conclusions reached here.

Such negative features of this book having been conceded at the outset, what are the positive features that excited my admiration for this work when it was in manuscript, and caused me to strongly urge its publication?

This book is the first full-length serious study of World-War-II-related Jewish population changes. Its esoteric air is perhaps, on the perceptual level, the perfect antidote to the vulgar idiocies that are today monotonously peddled by the media, for whom recent Jewish population changes are also of major interest, although such dry terminology is rarely employed by them.

This book presents the fundamentally correct account of the subject. While the basic structure of that account is not original with this book, the scope and depth of the study are great enough that I daresay that, barring the miraculous release of hitherto confidential data – especially by Zionist and Soviet controlled sources – the treatment has been carried here about as far as it can be.

While the complexity of the subject may disturb some, it is important to learn, as we do from this book better than from any other, why this complexity exists. While many of the numerical estimates are not conclusive, it is important to learn, as we do from this study better than from any other by examining its sources, that such estimates can be made by conscientious deduction from widely accepted, accurately cited and, on very important points, mostly Jewish literature.

The result is that the simplistic legends that have petrified postwar thought on the Jewish aspect of World War II are dealt another of the many blows they have received in recent years.

Addendum for the 2015 edition

In 1983 I wrote, “these massive movements subsided to trickles in the postwar period,” but now it is 2015, and the trickles have changed many details. Notable was the passage in the U.S. in 1974 of the “Jackson-Vanik Amendment,” dropped in 2012, which successfully encouraged, especially after the mid-1980s, emigration of Jews from the Soviet bloc.

In that period the population of Israel has grown from about 4 million to more than 8 million today, much of the increase consisting of Jews from the former Soviet bloc and elsewhere.

Thus an analysis of Sanning’s subject would produce some different numbers today, but that is inevitable. The subject matter, after all, is “the Wandering Jew,” and it just won’t stand still!

Introduction

Just one hundred years ago eastern Europe – Galicia, Ukraine, Hungary – was the center of the world’s Jewish population, but today that center has moved overseas to the Western Hemisphere and Israel. Whereas previously there was little doubt as to who was a Jew, today it is much more difficult to arrive at a satisfactory definition. The increasing secularization of industrial society in the recent past affected the Jewish people in particular. No wonder that today the question of the numerical size of the world Jewish population is one of the most controversial of demographic statistics. Nowhere does one encounter as many contradictions as in the attempt to assess the world’s Jewish population even within the margin of error of a million. The reputable *American Jewish Year Book*, for example, lists the size of the world’s Jewish population in 1979 as 14.5 million; looking a little closer, the surprised layman will find that this number includes several hundreds of thousands of gentiles. Other highly regarded experts such Dr. Nahum Goldmann, for example, believe that Israel’s almost 3.3 million Jews constitute almost one-fifth of World Jewry; in effect, he has put the figure for the world’s Jewish population at 16½ million.

Also, if one learns that only eleven million Jews are supposed to have survived World War Two and that this decimated remnant – with the exception of the Israelis – experienced a very slow natural growth in the post-war period due to over-aging, small families, rising assimilation tendencies and widespread mixed marriages, both of the above figures for the world’s Jewish population become questionable.

Any attempt to trace the flow of migration of the Jewish people during the past fifty years and to narrow down the size of the Jewish population – then and now – can only be successful if the enigmatic demographic characteristics of the Jews in their areas of departure – *i.e.* eastern Europe – become unraveled and, furthermore, if the migration movements are seen in the historical framework.

Unquestionably, the Second World War had by far the largest impact on the numerical development of the Jews in modern times. For this reason, especially the German-Soviet confrontation until 1945 and, thereafter, the determined effort of the Jews to leave the devastated historical countries of origin deserve to be paid the utmost attention.

Primarily in order to meet possible objections, this analysis is based almost entirely on Allied, Zionist and other “sympathetic” sources. The sig-

nificance of the statistical accountings in this study is also in the demonstration that they at least *can* be made on the basis of allegedly authoritative and largely Jewish sources. The most striking findings of this study are:

- A. The world's Jewish population faced a serious demographic crisis even before World War Two. This was also true of the Jews in eastern Europe.
- B. During the 1930s roughly one million Jews left the historic places in central and eastern Europe for North and South America, Palestine, western Europe and several other minor recipient countries.
- C. At the beginning of World War Two there were fewer than 16 million Jews in the world (Zionist data are listed in parentheses):

United States	5.0	(4.8) million
USSR (incl. Baltic states)	5.3	(3.3) million
Palestine	0.4	(0.4) million
European countries occupied by Germany during WWII	2.9	(6.0) million
Rest of the world	2.4	(2.2) million
	<hr/> 16.0	(16.6) million

- D. Of the 5½ million Jews in the Soviet Union at the outbreak of WWII, by far the largest part was evacuated to Siberia; less than 15% fell into German hands.
- E. One million Jews died while fighting in the Red Army or in Siberian labor camps; this aspect is generally passed over in Zionist accounts.
- F. 14¾ million Jews survived the last war (Zionist data in parentheses):

United States	5.2	(5.0) million
USSR	4.3	(2.0) million
Palestine	0.6	(0.6) million
European countries occupied by Germany during WWII	2.4	(1.1) million
Rest of the world	2.2	(2.3) million
	<hr/> 14.7	(11.0) million

- G. Today, the world's Jewish population numbers 16½ million (*American Jewish Year Book* data listed in parentheses):

United States*	6.7	(5.9) million
USSR	3.4	(2.6) million
Israel	3.2	(3.2) million
European countries occupied by Germany during WWII	1.0	(1.0) million
Rest of the world	2.0	(1.8) million
	<hr/> 16.3	(14.5) million

* including several hundreds of thousands of gentiles in the case of the 5.9 and 14.5 million figures of the *American Jewish Year Book*.

H. The Jewish world population is likely to decrease at accelerating rates during the coming decades.

This study represents just one step in the attempt to trace the dissolution of Eastern Jewry in the course of the last fifty years. Many of the figures presented will, no doubt, be adjusted as further research discovers new and/or more reliable sources. In particular, it is to be hoped that students of this fascinating subject will follow the main thrust of this analysis which points to three distinct areas where further search should prove rewarding:

1. Soviet deportation of civilians, particularly Jews, before and during the Second World War.
2. The importance of Turkey as a transit country for refugee Jews arriving there by train (Bulgaria) or by ship (Constanza/Rumania); Turkish archives are virgin territory in this respect.
3. Jewish displaced persons camps (UNRRA) from Iran to Morocco.

PART I

**THE SOVIET UNION
AND THE EASTERN JEWS**

FIRST CHAPTER:

Eastern Jewry

Myths die slowly, but historical myths sometimes go on to become “facts.” Often it is all but impossible to unmask them for what they are, because myths have that certain ingredient generally lacking in cold facts, namely, that people *want* to believe them – often for contradictory reasons. One of the myths with a questionable influence on our understanding and analysis of historical developments concerns the fertility of Europe’s Eastern Jewry.

If there is one Eastern Jewish trait which both National Socialists and Zionists agreed upon, then it was undoubtedly that particular eastern European minority’s proclivity to multiply rapidly. What one side considered being a threat, was a well of hope for the other.

Eastern Jewry, while steeped in orthodoxy and tradition, had achieved prolific natural growth rates in the 19th century. The reasons are close at hand: Its higher educational level enabled it to reduce death rates much sooner and faster than the surrounding native host population. At the same time, traditional values, religious beliefs and strong family bonds induced them to go on raising large families.

However, as political self-consciousness rose and industrial society enforced increased secularization, the old social fabric began to crumble – often with lightning speed. – Social characteristics were overturned within a short time span. In addition, the upheavals of World War One left lasting imprints on Eastern Jewish life. The rapidity of this development went almost unnoticed by Zionists and their foes.

In this Chapter we will show that the Eastern Jewry of the 1930s had changed fundamentally since the turn of the 19th to the 20th century and especially since World War One. Outside the Soviet Union, two-thirds of eastern Europe’s Jews lived in Poland at the end of the 1920s and, therefore, we will place our emphasis on the Polish Jews in the attempt to ascertain their demographic characteristics.

The Demographic Structure of Polish Jews

According to the Anglo-American Committee on European Jewry and Palestine (Anglo-American Committee) the Jewish population in Poland numbered 3,351,000 at the beginning of World War Two. The Jewish author Gerald Reitlinger asserted, though, that the Polish census of December 9, 1931, discovered only 2,732,600 “racial” Jews.¹ However, a natural increase by 620,000 during the following eight years is impossible: This would have been equivalent to an annual growth rate of 2.6%, far exceeding the fertility of the native Polish and Ukrainian host population; the *Universal Jewish Encyclopedia* (*Universal*) denies this possibility outright, and a Jewish immigration into anti-Semitic Poland was non-existent.²

The *Statesman's Yearbook 1944* reported that the Polish census contained two different figures for the Jewish population group: One based on “language” and the other on “religion.”³ The first corresponds exactly with Reitlinger's figure for the so-called “racial” Jews. As to religious preference the *Statesman's Yearbook* mentioned 3,113,900 Polish residents of the Mosaic faith. The resulting difference of 237,000 (3,351,000 less 3,113,900) could well represent the natural growth of a purportedly very fertile Eastern European Jewry during the period from the end of 1931 until the end of 1939.

Also, the *Universal* reported the average number of births among Polish Jews in the period from 1930 to 1935 to have been 85,000,⁴ a figure which would constitute 2.8% of a population of roughly three million. If the mortality figure of about 40,000 annually as provided by the same source is correct,⁵ the surplus of births over deaths between 1930 and 1935 would have averaged 45,000 per year. Projected for the time span 1932 to 1939, the Polish-Jewish population might have increased by 360,000 to reach 3.5 million by the start of the war; this latter number is also often being mentioned in post-war literature in connection with Polish Jews.

Still, the above remarks show that the size of Poland's Jewish population at the outbreak of WWII is by no means certain; Jewish sources differ to a substantial degree from one another and often they even contradict each other. In order to remove or, at least, limit these uncertainties, it is necessary to trace the structure and development of the Jews in Poland by

¹ Reitlinger, Gerald. *The Final Solution*, New York, 1961, p. 497.

² *Universal Jewish Encyclopedia*, New York, Vol. 10., 1943, p. 33.

³ *Statesman's Yearbook (The)*. New York, 1944, p. 1196.

⁴ *Universal Jewish Encyclopedia*, Vol. 10, p. 36.

⁵ *Ibid.*, p. 36. From 1930 to 1937 the mortality in Poland averaged 479,000 (*Schlag nach über Polen*. Leipzig: Bibliographisches Institut, 1940 [?], p. 15). The Jewish population accounted for 9.8% of Poland's population in 1931, but in the age group 50 years and over, where most of the natural deaths occurred, it was 10.9% (for source see Graph 2). Even conceding a smaller age-specific death rate for Jews than for the Polish or Ukrainian population, the average number of Jewish deaths in Poland in the 1930s must have been at least 45,000 per year.

resorting to available primary sources; only then will it be possible to shed more light on pre-war Eastern European Jewry.

The Polish census of December 9, 1931 found 3,113,933 of the 31,915,779 inhabitants (excluding armed forces) belonging to the Jewish faith⁶ and representing almost 9.8% of the total population. Compared to the non-Jewish population, the Jews exhibited marked differences as to geographic distribution, urban concentration, professions, natural increase and emigration.

15% of the non-Jews, for example, lived in the western provinces (Poznan, Pomerania and Silesia), but in the case of the Jews it was only 1%. The other 85% of the non-Jews divided rather evenly between the eastern and the central provinces. Because of the large Jewish population in Warsaw – every ninth Jew lived in the capital city in 1931 – the central provinces contained far more than half of all Jews, and still the eastern provinces accounted for over forty per cent of the Jewish population (*Table 1*).

Table 1: Percentage Distribution of the Jewish and the non-Jewish Population in Poland by Provinces as of December 9, 1931⁶

Provinces	Jews	Others

Poland total	9.76	27.26

Source: Same as *Table 1*.

In the central and eastern provinces the Jewish element represented “only” every eighth or tenth inhabitant, but in the cities it was an entirely different matter. There, the Jewish share was 31 and 37%, respectively (*Table 2*). Cities with a Jewish contingent of 50% and more were not at all unusual, especially in the smaller towns of eastern Poland.

Contrary to the huge percentage of Jews in Polish cities and towns, there were relatively few in rural areas: In all of Poland there were about 108 Jews for every 1,000 non-Jews; in the urban areas, however, this number rose to 375 and fell to a mere 33 in the countryside (*Table 3*).

Only *one*-quarter of the non-Jewish population was urban, with the Jews it was *three*-quarters. Also, official statistics tended to overstate the portion of the “rural” Jewish population to a considerable extent. Eastern Jewry still lived in large part in mostly small, yet town-like so-called “shtetls” which constituted some kind of a local trading and manufacturing center for the surrounding peasantry. These “shtetls” were not at all comparable to “villages” (in the European sense), which is indicated by the fact that the vast majority of the Jewish population of those “shtetls” was not engaged in farming.

*Table 3: Urbanization in Poland:
Jewish and non-Jewish Population as of December 9, 1931⁶*

	Population				Jews per thousand non-Jews
	Jews	(%)	non-Jews	(%)	
Country	733,858	(23.6)	22,450,874	(77.9)	33
Cities	2,380,075	(76.4)	6,350,972	(22.1)	375
of which: Cities with a population of					
< 20,000	929,852	(29.9)	2,301,566	(8.0)	404
> 20,000	1,450,223	(46.6)	4,049,406	(14.1)	358
Total	3,113,933	(100)	28,801,846	(100)	108

In all of Poland only 125,123 Jews (including family members) out of 3.1 million were classified as peasants. Assuming that two-thirds of them lived in the eastern provinces, only one in five of the 400,000 “rural” Jews of eastern Poland may be counted among the peasants. For these reasons the degree of urbanization of Polish Jews should be seen to be nearer 90% in 1931. In the case of non-Jews the opposite was true: Of the 22.5 million rural non-Jewish inhabitants in Poland 19.2 million, or 85%, were engaged in agriculture.

Unfortunately, the Polish census was somewhat deficient in providing data on religious affiliation in individual cities. For the eastern Polish provinces which are of primary interest in this study only 23 towns and cities could be found for which the Jewish population was specified: In two towns the Jewish percentage was 56 and 63%, in eleven towns it ranged from 40 to 49%, in seven towns it was between 31 and 36%, and in three towns 27 and 28%! In other words, not one town contained fewer than 25% Jews (*Table 4*).

The insignificant representation of Jews in Polish agriculture was mentioned before. It is clear, therefore, that the role Jews played outside Polish agriculture was that much larger in relative and absolute terms. For every single Jew in industry, handicrafts, trade and the other non-agricultural professions there were only a little more than three non-Jews despite the fact that Jews constituted less than one-tenth of the total population.

*Table 4: Eastern Polish Cities: Total Population and Jews
as of December 9, 1931*

In this connection, it is of some interest that in the category “self-employed,” *i.e.* merchants, artisans, doctors, lawyers, etc., the relationship of non-Jew to Jew was about one to one. Considering the small Jewish presence in the western Polish provinces – which because of their more advanced economic structure contained a considerable portion of the non-Jewish “self-employed” – the enormous Jewish influence in the secondary and tertiary sectors of the central and eastern Polish provinces becomes clearer yet. Among the Jews there were seven times as many “self-employed” as among the non-Jews; among salary earners the Jewish proportion was still 50% larger than their number would have warranted, and only among blue-collar workers was there no difference between the two population segments (*Table 5*).

As one would expect, these pronounced socio-economic differences between Jews and non-Jews also affected their respective natural increase. In a population of 3.1 million the portion of the less-than-one-year-old children was only 1.7%, in numbers 52,305, but with the non-Jewish population it was 2.6%. Surprisingly, this enormous gap between Jewish and non-Jewish fertility rates actually developed only since WWI. Until the early 1920s the Jewish population averaged roughly 12% of the non-Jewish – even though a slight recessive trend from 13 to 11% was obviously in progress; after 1924, however, the tendency was steeply downhill (*Graph 1*). Finally, in 1931 there were only seven Jewish births for every 100 non-Jewish births!

*Table 5: Professions in Poland: Jews and non-Jews
as of December 9, 1931*

Economic Sector	[1] Jews	(%)	[2] non-Jews	(%)	Over- and Underrepresentation of Jews
Agriculture	125,123	(4)	19,221,825	(67)	– 94%
Non-agricultural Sectors	2,988,810	(96)	9,580,021	(33)	+189 %
of which:					
Self-employed	699,244	(22)	763,617	(3)	+747 %
White-collar	91,970	(3)	555,274	(2)	+ 53 %
Blue-collar	277,555	(9)	2,473,344	(9)	+ 4 %

Not gainfully employed	1,865,785	(60)	5,367,580	(19)	+222 %
Total	3,113,933	(100)	28,801,846	(100)	

Source: *Drugi Powszechny Spis Ludności Z Dn. 9.XII 1931 R.*; Polska: Stosunki Zawodowe – Ludność, Poza Rolnictwem (Cześć II); Główny Urząd Statystyczny Rzeczypospolitej Polskiej, Statystyka Polski, Seria C, Zeszyt 94d (*Deuxième Recensement Général de la Population du 9 Décembre 1931*; Pologne: Professions - Population hors l'Agriculture – II Partie; Office Central de Statistique de la République Polonaise, Statistique de la Pologne), Warsaw, 1939.

Graph 1: Relationship of the Jewish to the non-Jewish Population in Poland by Age and Year of Birth as of December 9, 1931

Source: *Drugi Powszechny Spis Ludności Z Dn. 9.XII 1931 R.*; Mieszkania i Gospodarstwa Domowe. Ludność; Główny Urząd Statystyczny Rzeczypospolitej Polskiej, Statystyka Polski, Seria C, Zeszyt 94a (*Deuxième Recensement Général de la Population du 9 Décembre 1931*; Logements et Ménages, Population), Warsaw, 1938.

But the non-Jewish population in Poland also showed a clear deceleration in its birth rate. Both the Jewish and non-Jewish population suffered great losses in the number of births during WWI and both registered a steep rise after hostilities ended. To be sure, the non-Jewish population saw no further rise in the number of births since the early 1920s, but they were kept at a relatively high level of 730,000. Not so with the Jews; after reaching a high of 74,875 in 1925, their number of births dropped consistently until it reached 52,305 in 1931 (*Graph 2*).

Thus, while the 1931 age group of the non-Jewish population was almost twice as large as the age group of the war-year 1917 and of the turn of the 19th to the 20th century – 30 to 35 years earlier – in the case of the Jews it was just barely greater in either instance. The *Universal* proved quite right when it wrote referring to the Polish Jews: “But even in Eastern Europe the birth rate was falling, and began to approach that of Western Europe”⁷ – and that was already negative before WWII.

⁷ *Universal Jewish Encyclopedia*, Vol. 10, p. 33.

Graph 2: Population Pyramid of the Jewish and the non-Jewish Population in Poland as of December 9, 1931 (in 1,000)

Source: See Graph 1.

As far as is known, there are no official statistics on Polish-Jewish mortality rates before the war. If one accepts the mortality figures of the *Universal* of an average of 40,000 per year for the period 1930 to 1935 – for the Soviet Jews with a numerically similarly large population an average mortality figure of 43,000 was indicated – then the Jews should have enjoyed a surplus of births over deaths of about 12,000 in 1931 (52,305 minus 40,000), or 0.4%!

Obviously, the huge emigration of Polish Jews prior to and following WWI influenced their natural growth rate very negatively because it is generally the younger, fertile age groups who decide to leave; the older people often have too deep roots in the country in which they were born. An excellent example of the strong ties of older people to their country of birth is provided by the very different emigration pattern of younger and older German Jews in the 1930s.

Of the roughly 500,000 Jews living in Germany in 1933 about 160,000 were 50 years or older. By August of 1939, the German-Jewish population had dropped to 272,000; included in this figure were 140,000 people aged 50 years and older. This means that the Jews of 50 years and younger had

seen their numbers reduced by almost two-thirds from about 340,000 to less than 130,000, while the age group “50 years and older” had shrunk only one-eighth from 160,000 to 140,000.⁸

Now, comparable figures are not available for the Polish-Jewish population of the 1930s, but the Polish census of 1931 nevertheless provides an indication that similar developments were under way among the Jews of Poland. The ratio of the male to female population for the age group born between 1917 and 1931 – children between zero and 14 years – averaged 102.9 to 100 for Jews and 102.5 to 100 for non-Jews. The 15-to-29-year-olds (age group 1902-1916), however, differed markedly with ratios of 85.7/100 and 93/100, respectively.⁹

It is only natural that the original numerical male predominance should change over time in favor of a slight female majority; but such a drastic reduction of the male side during peacetime must either be due to a comparably much larger emigration of young men or – as the Polish census did not include 191,473 members of the armed forces – to military service or both. If one assumes (data are unavailable) that three-quarters of these military men were less than 30 years old and that Jews constituted about 10% (in keeping with their share of the population), then we obtain additional 14,361 young Jews to be added to the 424,575 aged 15 to 29 years. Compared with the 495,405 Jewesses of that age group, the ratio obtained is 88.6/100; the same non-Jewish age group shows an adjusted ratio of 96/100.

To be sure, the age groups of 1902 and before also show a clear female majority, but this should be expected considering the higher life expectancy of the fair sex and the losses suffered by men in WWI. The male/female ratio in the age groups “1872-1901” who were subject to military service during WWI was the same for Jews and non-Jews, namely, 88/100. It is thus very surprising to see the Jews of the age groups “1902-1916” evidence a male/female ratio of 88.6/100. In other words, there must have been very, very many young Jewish men who left Poland after WWI single without families.¹⁰ Their approximate number may be estimated by taking the difference between male and female Jews in that age group: It is about 56,000!

⁸ Ruppin, Arthur. *The Jewish Fate and Future*, London, 1940, p. 100.

⁹ Computed on the basis of information contained in *Table 12* of the *Drugi Powszechny Spis Ludności Z Dn. 9.XII 1931 R.* “Polska: Mieszkania I Gospodarstwa Domowe, Ludność,” Seria C, Zeszyt 94a (Deuxieme Recensement Général de la Population du 9 Décembre 1931, “Pologne: Logements et Ménages, Population,” Serie C, Fascicule 94a), Warsaw, 1938.

¹⁰ An indication of the validity of this conclusion can be found in the *Statistical Abstract of Israel*. According to issue no. 31 (1980), p. 133, 35,183 and 81,613 Jews immigrated in the years 1919/1923 and 1924/1931, respectively. Issue no. 2 (1950/51), p. 26, fixed the male share among the immigrants at 63.2 and 54%, respectively. This translates into an average share of 57% male Jewish immigrants in Palestine between the end of World War One and 1931, *i.e.* male Jews outnumbered Jewesses by one third. A large, probably the largest part of these immigrants hailed from Poland.

It is a fact that official Polish statistics indicate only a relatively small-size Jewish emigration. But to conclude that only a small number of Jewish emigrants left Poland would be just as mistaken as to infer a small Mexican immigration in the United States after WWII on the basis of Mexican emigration statistics. Illegal border crossings cannot be traced by means of official emigration statistics.

Polish statistics list 294,139 emigrant Jews in the period 1921 to 1931.¹¹ Deducting the above mentioned 56,000 single young male Jews without families, there remain 238,000 who left in family groups. On the basis of five persons per family one obtains fewer than 48,000 heads of households.

The misery of the Jews in Poland following WWI unfolds in the huge number of these young, often very young men who went abroad in search of a livelihood. In Jewish historical experience this is quite without precedent. In view of the large number of Jewish families who fled the USSR in the course of the Russian Civil War, who lost their homes during WWI and the ensuing Polish-Soviet War and who practically saw no other solution to their desperate situation than to leave troubled, anti-Semitic Poland, it looks rather ridiculous to place the number of emigrant Jewish families below the number of single young Jewish males, particularly as most Eastern Jews had numerous relatives abroad, especially in North America. There is only one conclusion possible: The Polish emigration statistics are worthless.

Official Polish figures mention only 75,527 Jewish emigrants for the years 1934 to 1937.¹² How far removed these figures are from reality may be seen from the enormous Jewish immigration in Western countries and in Palestine prior to WWII, from the fact that the vast majority of extra-Soviet Eastern European Jews lived in Poland (until 1939), and from the naked truth that no country treated the Jews worse than did Poland (at least until 1938). The Poles tried to get rid of their Jews by all means at their disposal; on the other hand, the Western countries refused to accept Jewish immigrants. Therefore, it was in the Polish interest *not* to draw the world's attention to the actual extent of Jewish emigration from Poland.

Between 1934 and 1937, for example, 68,000 Jewish immigrants from Poland arrived in Palestine.¹³ If Polish emigration statistics were accurate,

¹¹ Lestschinsky, J. "National Groups in Polish Emigration," *Jewish Social Studies*, Vol. 5, 1943, p. 109.

¹² *Ibid.*, p. 109.

¹³ The figure of 68,000 Jewish immigrants in Palestine from Poland between 1934 and 1937 was computed as follows: The Jewish immigration in Palestine was listed by the *Encyclopaedia Judaica*, Jerusalem, 1972, Vol. 4, p. 534: 45,267 (1934), 66,472 (1935), 29,595 (1936), 10,629 (1937). The number of Jews coming from Poland according to Arieh Tartakower and Kurt R. Grossmann, *The Jewish Refugee*, New York, 1944, p. 345 was 43% (1934), 49% (1935), 41% (1936) und 35% (1937); the share of Jewish immigrants from Germany was listed as 16%, 11%, 27% und 34%, respectively, and the share of Jewish immigrants from all other countries as 41%, 40%, 32% und 31%, respectively. Inasmuch as the "other" Jewish immigrants could only have come from eastern Europe, the Jews coming from those "other" eastern European countries

90% of the Polish-Jewish emigrants would have left for Palestine, even though Polish Jews enjoyed the closest ties of kinship to hundreds of thousands of Jews in the U.S. We will show in the Seventh Chapter that 400,000 Jews entered the United States between 1933 and 1943. Only a small fraction of them hailed from Germany; Jewish sources maintain anyway that until the end of 1940 just 26% of German-Jewish emigrants went to the United States, *i.e.* 100,000.¹⁴

Of course, other central and eastern European countries, too, recorded a large flow of Jewish emigration, but the largest segment of Jewish immigration into the United States must have originated in Poland. Of the 4.3 million Jews in the geographic area encompassed by Poland, the Baltic countries, Rumania, Hungary and Czechoslovakia before the war, approximately two-thirds lived in Poland. Therefore, the largest contingent of Jewish immigrants in North America between 1933 and 1943 simply must have come from that country.

At the same time, western European countries accepted uncounted tens of thousands of Jewish refugees and immigrants from Germany and eastern Europe during the 1930s. At the end of the 1920s a total of 315,000 Jews lived in France and the Benelux countries,¹⁵ by the beginning of the war their number was put at 480,000.¹⁶ The natural increase of this highly urbanized population with its low fertility was minimal; the growth of 165,000 was almost exclusively the result of net immigration. But since Jewish sources specify that 83% of the Jews leaving Germany were headed for North and South America, Palestine, Shanghai and England,¹⁷ by far the largest part of these Jewish immigrants in France and the Benelux countries must have come from countries to the east and southeast of Germany, and again there is only one country in eastern Europe qualifying as the main source of Jewish emigration, namely Poland.

In this respect, even the Institute for Contemporary History in Munich (Institut für Zeitgeschichte) admitted:¹⁸

The wave of emigration of German Jews was only a part – and not even the largest one at that – of a general Jewish emigration from central, eastern and

were almost as many in number as those from Poland. Because of the overwhelming size of the Polish Jews relative to the other eastern European Jews (excl. the USSR), this does not seem realistic; in all probability, the “other” Jewish immigrants in Palestine included many Jews who originally hailed from Poland as well. The Polish-Jewish group of immigrants in Palestine between 1934 and 1937 must have numbered far more than 68,000, possibly more than 80,000!

¹⁴ Adlerstein, Fanny R., “Foreign Department,” *The Jewish Social Service Quarterly*, New York, Vol. XVII, No. 4, June 1941, p. 386. The figure of 100,000 also includes Jewish emigrants from Austria.

¹⁸ Institut für Zeitgeschichte (ed.), pp. 79 and 80.

southeastern Europe. In the years following 1933 about 100,000 Jews left Poland every year, partly because of the increasingly anti-Semitic policies of the Polish government, but also because of the progressively worsening pauperization of the Polish Jews. Similar tendencies existed in Latvia, Lithuania, Rumania and, to a lesser degree, in Hungary.

The economic situation of Polish Jews deteriorated drastically during the 1930s. Systematic campaigns were organized to crowd them out of the economy; the boycott of Jewish stores was enforced with brutality, and was found to be within the law by the courts, was blessed by the Catholic Church of Poland, and officially sanctioned by the central government. Anti-Semitic incidents spread throughout Poland and resulted in many victims. Bloody persecutions took place in 1937 in Brest-Litovsk and in Czestochowa.¹⁹

The statement by the Institute for Contemporary History, whose pro-Zionist credentials are excellent, that the largest wave of emigration did not originate in Germany is thus quite correct. Just as correct are its findings that 100,000 Jews emigrated from Poland every year after 1933; this may contradict official Polish emigration statistics whose reliability is subject to doubt, but the tremendous Jewish immigration in Palestine, the USA, South America, France, the Benelux countries, England, etc., prior to WWII support the Munich Institute's testimony.

The persistent emigration, especially of young single Jewish males who would normally have raised families of their own, and the growing economic distress make it rather improbable that the reduction of the birth rate since the mid-1920s could have stopped after 1931. Everything points to an excess of deaths over births for the Jewish population in the latter part of the 1930s. Therefore, even an average growth rate of 0.2% per year between 1932 and 1939 seems somewhat high for the Polish-Jewish population.²⁰

Placing the number of Jewish emigrants from Poland in the seven years and eight months from the beginning of 1932 until September 1939 at 500,000 – the Munich Institute for Contemporary History mentions 100,000 annually *after 1933* – the size of the Jewish population in Poland may thus be estimated at 2,664,000 at the beginning of the war. Subtracting the 31,216 Polish-Jewish soldiers reported by the Polish general staff to have been killed in the subsequent German-Polish war,²¹ the final number of Polish Jews following the cessation of hostilities at the end of September 1939 may be said to have been 2,633,000. The figure of 3,351,000 as reported by the Anglo-American Committee thus is shown to be too large by 700,000!

¹⁹ *Universal Jewish Encyclopedia*, Vol. 8, p. 574.

²⁰ According to official Polish surveys, the birth rate fell in Poland between 1931 and 1937 from 3.02% to 2.49% (*Schlag nach über Polen*, p. 15). The Jewish rate reached 1.7% in 1931 already, and it is not likely that it moved against the weakening Polish trend thereafter. A negative net growth rate is thus quite probable for Poland's Jewish population at the end of the 1930s.

²¹ *Universal Jewish Encyclopedia*, Vol. 8, p. 576.

Jews in Other Eastern European Countries

Much of what was said regarding Polish Jews applies to Jewry of the other countries in eastern Europe as well. With few exceptions its birth rate was low, even negative on a net basis, and its urban concentration was extraordinary. Its average marriage age far exceeded that of the host populations, and emigration, particularly among young males, was widespread. Still, there are some noteworthy differences in degree from the situation found in Poland.

The *Czechoslovakian* Jews cannot be treated as a single group; too large are the differences between Czech, Slovak and Ruthenian (Carpathian) Jews; they reflect the gap in economic development in this artificial heterogeneous country, as one proceeds from west to east. There, too, young Jewish males left the impoverished eastern areas but instead of going outside the country, they merely migrated to the highly industrialized Bohemian and Moravian areas. Thus, whereas Ruthenian and Slovak Jewish males aged 15-29 years numbered only 81.3% and 95.1%, respectively, of the Jewesses of the same age group, the situation was reversed in the *Czech* areas of Bohemia and Moravia. There, Jewish males aged 15-29 exceeded the opposite sex by 23.5% as registered by the census taken in 1930.²² This uneven migration affected the fertility of the Jews in Slovakia and Ruthenia rather adversely, yet no positive growth effects could be registered in *Bohemia and Moravia*.

In the latter two provinces, Jewry was declining since before WWI. In 1930, the largest age group was accounted for by those born between 1906 and 1910; this group represented almost 10% of the total, or 2% for each year. From then on a rapid decline dropped the annual average to 1.35% for the years 1911-1915 and 0.77% for 1916-1920; after WWI, a small baby boom let the group born from 1921-1925 reach 1.1% per year, only to fall again to an annual average of just over 0.8% in 1926-1930. Given the trend of those years, it is fair to state that those less than one year old in 1930 accounted for just 0.6% of the Czech Jews. This low rate would imply an excess of deaths over births somewhere between 0.5% and 1% per year.

In *Slovakia*, the Jewish demographic crisis was not yet as deep, but the trend was similar. From the 1906/1910 period to 1926/1930 the average annual strength of the mentioned age groups fell from 2% to 1.66%. Those born in 1930 probably constituted only about 1.5% of Slovakia's Jews, which was just barely greater than the natural death rate.

²² Sčítání Lidu V Republice Československé Ze Dne 1. Prosince 1930 (Díl I.: Rust, Koncentrace A Hustota Obyvatelstva, Pohlaví, Věkové Rozvrstvení, Rodinný Stav, Státní Příslušnost, Národnost, Náboženské Vyznání), Vydal Státní Úřad Statistický, Československá Statistika – Svazek 98, Řada VI., Sešit 7, Prague, 1934, Tab. 19, p. 156-164.

Only in backward *Ruthenia* was the traditional Eastern Jewish family still intact, but it seems that there, too, a turning point had been reached. The age group 1926/1930 averaged almost 2.9% per year, compared to 2.8% for 1921/1925. A birth rate of 2.9%, if maintained, would have resulted in a high natural increase during the 1930s of maybe 1.5% p.a. or more. Given the considerable emigration of young males to the Czech areas, the economic crisis of the 1930s and the growing secularization of life in Ruthenia prior to WWII, it is likely that after 1930 there was a drop in the birth rate, even though it probably remained fairly high by general Jewish standards of those years. In any case, when Hungary, which meanwhile had regained Ruthenia from Czechoslovakia, conducted a census in 1941, only about 109,000 (see Sixth Chapter) were found there compared to 102,542 as recorded by the Czechoslovak census of 1930; this is equivalent to a natural increase of 0.6% p.a. between 1930 and 1941. This rate would appear somewhat low for that fertile, but tiny segment of Eastern Jewry, and probably reflects a continuing emigration of young males to the industrial Czech areas.

Hungary's Jews – according to the census of 1930 there were 444,567²³ – lived overwhelmingly in the larger cities. 204,371, or 46%, were concentrated in the capital city, another 130,207 lived in the Great Plain districts east of the Danube, 49,252 in the north, and just 60,737 west of the Danube. Since 1920, the total Jewish population had decreased by 28,788 from 473,355.²⁴

After 1927 Hungary's Jews recorded considerable excesses of deaths over births. From 1927 until 1930 the average annual decrease amounted to 467 (0.1% p.a.)²⁵ and reached 0.5% in 1938.²⁶

Year	Births	Deaths	Natural Growth	
			in % of the	
			Balance	Jewish population
1930	5,533	5,917	– 384	– 0.1
1931	5,187	6,244	– 1,057	– 0.3
1937			– 1,574	– 0.4
1938			– 1,899	– 0.5

Obviously, the Hungarian Jews were in the midst of a serious demographic decline during the 1930s with the number of deaths probably 40% higher than that of births.

²³ *Annuaire Statistique Hongrois 1931*, Nouveau Cours XXXIX, l'Office Central Royal Hongrois de Statistique, Budapest, 1933, Tab. 10, p. 11.

²⁴ *Ibid.*, Tab. 9, p. 10.

²⁵ *Ibid.*, Tab. 21, p. 28.

²⁶ *Magyar Statisztikai Évkönyv 1942*, Új Folyam L, A Magyar Kir. Központi Statisztikai Hivatal, Budapest, 1944, Tab. 21, p. 36.

By 1941, after the acquisition of neighboring territories containing maybe 325,000 Jews, *i.e.* an increase by 73% over 1930, the total number of births (8,380) still was only 50% larger than in 1930, but deaths of 10,074 exceeded their 1930-level also by 73%. In 1942, the roughly 725,000 Greater Hungarian Jews counted only 8,413 births but 10,787 deaths, in relation to their total number, 1.2% and 1.5%, respectively – a natural decrease of 0.3% p.a.²⁷

In other words, the addition of the 325,000 Jews in the acquired territories (see Sixth Chapter) brought no significant improvement to the average rate of natural decrease despite the fact that one-third of those 325,000 “new” Hungarian Jews belonged to the relatively fertile Ruthenian Jewry. Obviously, the Jews living in the newly acquired territories of northern Transylvania, Banat and southern Slovakia had registered birth and death rates quite similar to those of the “old” Trianon-Hungary, Which is to say, their natural demographic development also was gravely negative.

Thus, as a matter of record, the Jewry of the areas covered by Trianon-Hungary, the former Slovak areas, the Banat (Serbia) and northern Transylvania (Rumania) suffered large annual population decreases as a result of very low birth rates. The Ruthenian Jews, whose fertility, no doubt, had lessened as well until WWII, nevertheless registered positive growth rates. But they were the exception to the general Jewish demographic pattern in eastern Europe and the Balkans, and their small total number could not affect the numerical decline of Eastern Jewry before the war.

As to the growth of *Rumanian Jewry* during the 1930s, the *Universal Jewish Encyclopedia (Universal)* has this to say:²⁸

[...] in 1932 it [the number of births] was 12,586 for Greater Rumania and 10,039 in 1938, whereas the death rate for the corresponding years was 9,891 and 10,250. Thus from a surplus of 2,695 in 1932 there was a deficit of 213 in 1938. The birth rate steadily declined.

The surplus of births – in 1932 it averaged just 0.35% – had turned into a *deficit* by 1938; it seems that allowing for an average growth rate of 0.2% during the 1930s would be ample.

In *Latvia*, the general population’s fertility rates fell long before WWI. In 1935, the birth rate was down to 1.67%, and the mortality rate of the previous 5-year-period averaged 1.38%. As a result, the net natural population increase was less than half a percent and dropping further. The Jewish

²⁷ *Ibid.*, Tab. 14, p. 33 and Tab. 16, p. 34.

²⁸ *Universal Jewish Encyclopedia*, Vol. 9, p. 265.

population – 93,479 according to the 1935 census²⁹ – constituted less than 5% of the total population.

Regionally, about 50% of the Latvian Jews lived in or near Riga, the capital; another 30% populated the easternmost province of Latgale. Urbanization was almost total: Almost 93% of Latvia's Jewry lived in the cities in contrast to only 34% of the non-Jewish population; but because of their relatively small number, Jews made up a smaller portion of the urban populace than was usual for eastern Europe. Among the larger cities only Daugavpils and Rezekne had a Jewish share of 25%; in all the other urban centers (including Riga) Jews averaged only 11% of the population.³⁰

As to natural growth, the Latvian Jews showed traits very similar to those in Poland. Until the turn of the century there was a rapid growth, followed by a levelling off until WWI. The war almost halved the number of births, but after the cessation of hostilities the birth rate jumped briefly to a level close to, but still below pre-war years. According to the census, young Jews 11 years of age numbered 1,787, thereafter a rapid decline set in. At the time of the 1935 count, only 1,137 were less than one year old – a decline of at least 36% compared with 1924. Thus, the birth rate was only 1.2%.³¹ As mentioned before, Latvia's total mortality rate averaged 1.4% in the early 1930s; while Jewish mortality is not known, it is not likely to have departed much from the national average. This means that already in 1935 and in the years just previous the Jews failed to replace themselves. With economic conditions worsening thereafter, the birth rate probably declined further, producing ever larger rates of natural decrease as the decade wore on.

This brief sketch of the demographic patterns of the various Eastern European Jewish communities outside the Soviet Union allows us to state that, on average, far from general fertility, eastern Europe's Jews had no natural increase whatsoever during the 1930s. We considered a total population numbering almost 4.8 million in the early 1930s – 93% of Eastern Jewry outside Russia. This population, concentrated in an area reaching from Riga to Budapest and Bucharest, was in the midst of a demographic revolution. Rapid concentration in the larger cities, the decline of Yiddish in favor of the native national languages, large-scale emigration of young single Jewish males, late marriages, the turn to the one- and two-children-family had already destroyed Jewish orthodoxy; only a few tiny remnants remained, for example in Carpathian Ruthenia, too small to offset the losses suffered elsewhere and themselves subject to secularization pressures. By the end of the 1930s, there was no country in eastern Europe where

²⁹ *Ceturtā Tautas Skaitīšana Latvijā 1935 gadā*, III: Vecums, Ģimenes Stāvoklis (*Quatrieme Recensement de la Population en Lettonie en 1935*, III: Age, Etat Civil), Valsts Statistiskā Pārvalde, Riga, 1937, Tab. 10, p. 217; Tab. 8, p. 206, and pages 120-121.

³⁰ *Ibid.*, p. 297, 298 and 319.

³¹ *Ibid.*, p. 216-217.

Jews were able to register natural growth gains. In some, mortality rates for Jews far exceeded birth rates. It is fair to state that – on average – eastern Europe's Jewry even registered a small natural decline between 1930 and 1939.

SECOND CHAPTER:

The Growth of Soviet Jewry

The Division of Polish Jewry

Still unclear is the distribution of these 2,633,000 Polish Jews over the various areas incorporated into the German Reich, combined in the so-called “Government General of Poland” or occupied by the Soviet Union. According to the *Universal*, a German statistician calculated on the basis of the Polish census of December 9, 1931, the following geographic distribution of Jews among the three specified regions:¹

Areas incorporated by Germany	632,000	(20.3%)
Government General of Poland	1,269,000	(40.8%)
Under German administration	1,901,000	(61.0%)
Annexed by the Soviet Union	1,212,900	(39.0%)
Former Polish Jews (1931)	3,113,900	(100.0%)

The Polish census of 1931 showed that the natural development of eastern Polish Jewry did not differ from the national Jewish average, but it is unknown whether there was any change thereafter – which is improbable – and whether emigration flows during the 1930s were similar in the three areas. Thus, we have to assume that all three areas experienced roughly the same demographic development between 1932 and 1939 as far as the Jewish population is concerned.

As mentioned in the First Chapter, the number of Polish Jews declined from 3,113,900 to 2,633,000, *i.e.* by 15.4%, between the end of 1931 and September 1939. On the basis of this relative reduction we obtain the following Jewish population for the three areas:

Areas incorporated by Germany	534,000	(20.3%)
Government General of Poland	1,073,000	(40.8%)
Under German administration	1,607,000	(61.0%)
Annexed by the Soviet Union	1,026,000	(39.0%)
Former Polish Jews (1939)	2,633,000	(100.0%)

¹ *Universal Jewish Encyclopedia*, Vol. 8, p. 577.

As the Polish defeat began to crystallize shortly after the outbreak of the hostilities, many Polish Jews didn't bother to await the German occupation; they fled in droves to the eastern Polish cities and towns which later were occupied and annexed by the Soviet Union in the second half of September – but smaller numbers also crossed the border into Rumania. Referring to this massive flight, the Latvian Chief Rabbi and leader of the Miz-rachi Organization and of the World Jewish Congress, Mordecai Nurok, said on March 28, 1946 at a press conference in New York:²

It must be emphasized that several hundred thousands of Polish and other Jews found a haven from the Nazis in the U.S.S.R.

This flight away from the sphere of German influence was facilitated by the circumstance that the Soviets originally also occupied the territory between the Vistula and Bug rivers as specified in the German-Soviet agreement on the division of Polish territory; because of this, many Jewish inhabitants of the crumbling Polish state succeeded in escaping from the nearby larger cities – Warsaw, Lodz, etc. – to reach Soviet-occupied areas. One week later the Soviets withdrew from the area west of the Bug, taking the entire livestock with them.³ The Jewish refugees, along with many local Jews, accompanied the Red Army, as it pulled back towards positions east of the Bug. The city of Tomaszow Lubelski may serve as an example of this systematic evasion by the Jews away from German control; according to the *Encyclopaedia Judaica* (Judaica) 75% of the city's 6,000 Jews left together with the Red Army, as it withdrew to the newly established line of demarcation further east.⁴

Official German calculations show that the area between the Vistula and the Bug contained a Jewish population of 386,600 at the time of the last Polish census in 1931. If the Jewish population loss of that area in the years before the outbreak of the German-Polish war amounted to the same percentage as for the Polish Jews in general, only 330,000 Jews could have been present at the time of the Soviet occupation (after September 17, 1939). It is not known how many Jews accompanied the Soviet Army when it vacated that region after September 28, 1939, but the massed flight of Polish Jews in an easterly direction – attested to by many witnesses – and the example of Tomaszow Lubelski permit the conclusion that the vast majority of Jews living between the Vistula and the Bug must have left together with the Red Army. It is strange, therefore, that the discussions about the number of Jews who might have succeeded in escaping into Soviet-controlled territory pass over this episode almost completely, even

² *American Jewish Year Book (AJYB)*, New York, 1946, Vol. 48, p. 324.

⁴ *Encyclopaedia Judaica*, Vol. 15, p. 1214.

though these more than 300,000 Jews had the best chance to evade German control.⁵

Among the Jewish refugees fleeing eastward was also the 26-year-old Menachem Begin; born in Brest-Litovsk in 1913, the latter-day Israeli Prime Minister studied at the University of Warsaw where he headed the Betar Zionist Youth Movement in Poland until 1939.⁶

In the Eichmann “Trial” in Jerusalem, the Polish Jews Zwi Patscher and Yakov Goldfine testified that the Germans drove Polish Jews marching four abreast in long columns onto the Soviet portion of occupied Poland.⁷ The *Judaica* reported in a similar vein:⁸

With the outbreak of the war in September, the Poles began to loot stores and attack the Jews. [...] the Jews were deported by the Germans [September 1939] to the area under Soviet control on the other side of the San River. [...] Those who were deported to the Soviet Zone lived there in very difficult economic conditions. In the summer of 1940 many of them were deported to the Soviet interior.

No one knows for certain how large the number of Jews was who either fled or were driven to the Soviet-occupied former Polish territory and who, within less than a year’s time, found themselves in Siberian labor and concentration camps – if they survived the murderous trip. But we do know that the eastern Polish cities and towns which contained a large Jewish element already, suddenly had to cope with untold masses of displaced Jews: In many towns in eastern Poland the Jewish population doubled overnight: The *Judaica* refers to this mass flight again and again. Regarding Vladimir-Volynsk it writes:⁹

[...] thousands of Jews from western Poland sought refuge in the city, bringing the number of Jews in the City to 25,000. [1931: 10,665 or 44% of the population...] In the summer of 1940 many Zionist leaders and refugees were exiled to the Soviet interior.

Lutsk:¹⁰

Many refugees who had fled to Lutsk from Nazi-occupied western Poland were deported to the Soviet interior.

⁵ The Jewish population of the area between the Vistula and the Bug, from which the Soviets withdrew after 9/28/1939, contained 386,600 Jews on 12/9/1931 according to the Bundesarchiv in Koblenz, Bestand R 153, Aktenband 287: *Die Bevölkerung des ehemaligen polnischen Staatsgebiets westlich der Grenzlinie vom 28.9.1939 nach dem Bekenntnis auf Grund der polnischen Volkszählung von 1931* as well as *Die Bevölkerung des polnischen Staatsgebiets westlich der Demarkationslinie vom 21.9.1939 nach dem Bekenntnis auf Grund der polnischen Volkszählung von 1931*.

Pinsk:¹¹

A large number of Jewish refugees from western Poland found shelter in Pinsk, but were deported to the Soviet interior in 1940.

Rovno:¹²

Many Jewish refugees from western Poland found shelter in Rovno [...]

Nine years after WWII, on September 22 and 23, 1954, an investigating committee of the U.S. House of Representatives (Select Committee on Communist Aggression) conducted hearings where representatives of several Jewish organizations testified under oath on the subject of the persecution of Jews by the Soviet. One Herschel Weinrauch, formerly an associate editor of the Soviet newspaper *The Star*, declared that he was an official in the civil administration of Bialystok following the Soviet occupation in 1939. In his testimony he said the Communists made all refugee Jews from German-occupied Poland choose in the spring of 1940 between accepting Soviet citizenship or returning to German control.

Because of the barbarian treatment accorded these Jews from the western portion of divided Poland by the Soviets, most of them opted *for* a return. Shortly thereafter, though, the Soviet government arrested all those who had decided to return and transported them to Siberia. In Bialystok alone, 50,000 to 60,000 Jewish refugees were arrested. All in all, the Soviets deported roughly 1,000,000 Jewish refugees from western Poland to Siberia.¹³

Another witness, Bronislaw Teichholz, chairman of the International Committee for Jewish Refugees from Concentration Camps from 1945 to 1952, confirmed Weinrauch's testimony. At that time he had been working in Lvov, where about 50,000 Jewish refugees had decided to return; all of them were deported by the Soviets, in the process crowding 70 to 80 persons into railroad cars and then moving them eastward.¹⁴

A third witness, Adolph Held, chairman of the Jewish Labor Committee, was absent due to an incident of death in his family, but he had his testimony read to the investigating committee by the vice chairman Jacob T. Zukerman. This witness, too, confirmed that up to 1,000,000 Jews escaped to Russia.¹⁵ Another witness, Henry Edward Schultz, national chairman of the Anti-Defamation League of B'nai B'rith, put the number of Jewish refugees from western Poland deported on Stalin's orders to Siberian labor

¹⁵ *Ibid.*, p. 61.

camps at 600,000; 450,000 of these unfortunate people have vanished without a trace.¹⁶

The Polish Government-in-Exile, too, declared the Soviets deported 600,000 Jewish refugees from western Poland in the spring of 1940. The Jewish statistician, J. Kulischer, asserted that Stalin evacuated 530,000 Jews – 500,000 from eastern Poland and 30,000 from the Baltic countries.¹⁷ Other Jewish sources arrive at even lower figures.

Rabbi Aaron Pechenick described the Soviet mass deportation in his book *Zionism and Judaism in Soviet Russia* published in New York in 1943 as follows:¹⁸

In two days and two nights [end of June 1940] almost one million Jews were loaded into cattle wagons under the most horrible circumstances and deported to Siberia and the Ural. [...] The terrible journey lasted from four to six weeks. Having arrived at their destinations, the Jews obtained only bread and water to sustain their lives after the long working days in the forests.

The *Universal* reported that the Joint Distribution Committee – a large international Jewish refugee aid organization – initiated a relief program in early 1942 for 600,000 *Polish-Jewish* refugees in Asiatic Russia.¹⁹ However, if there were 600,000 of these Jewish refugees in Soviet Asia in early 1942, many more must have been shipped off to Siberia by the Soviets, because the journey brought death and hardship to many. In connection with the inhuman transport to the east, the Joint Distribution Committee wrote in its Bulletin of June 1943:²⁰

From a fifth to a third of the number of refugees died [...] whoever did not see the thousands of graves, mostly of children, cannot understand.

This means that the number of Jewish refugees from western Poland who were arrested by the Soviets and deported to Siberia ranged from 750,000 to 900,000! But only 600,000 survived the incredible journey and arrived at their destination.

Menachem Begin belonged to these deported unfortunates also. The Soviet secret police arrested him a short time after his arrival in Soviet-occupied eastern Poland and put him into a Siberian concentration camp. Following the outbreak of the German-Soviet war (June 22, 1941) he joined the Soviet-sponsored Polish army which left the USSR in 1942 by way of Iran. In the very same year we find the former Soviet concentration

camp inmate and subsequent recipient of the Nobel Peace Prize as the commander-in-chief of the murderous IRGUN gang in Palestine.²¹

The extent of the Jewish flight before the German armies is not at all unusual. As a result of years of continuous Zionist campaigns and Polish inflammatory propaganda, the Jewish fear of the Germans knew no limits; this is probably the most likely explanation for the panic which gripped Polish Jews and non-Jews. Similar events developed in May 1940 when 1½ to 2 million panicky Belgians sought refuge in France, where they suffered severely; in mid-August 1940, there were still 1 million Belgians in France waiting to return home.²²

Considering that up to one-fourth of this nation of just eight million fled in panic, even though the German Government can hardly be accused of hostility towards the Belgian people (but certainly towards the Jews), the extent of the Polish-Jewish flight is not very surprising. It is worth noting that in terms of time and geography, Polish Jews were much better situated to escape in an easterly direction; after all, during the German Western Campaign, Guderian's Panzer divisions had cut the escape route from Belgium to France in little more than a week.

For lack of further proof, we will accept the lower figure of 750,000 Jews as having fled from western Poland to the Soviet-occupied former Polish territory. The distribution of the Polish-Jewish population between the German and Soviet occupation zones in Poland therefore changed as follows:

Areas under German control	857,000	(32.5%)
Areas under Soviet control	1,776,000	(67.5%)
<u>Former Polish Jews (end of 1939)</u>	<u>2,633,000</u>	<u>(100.0%)</u>

But not only the USSR, Rumania also served as an escape valve for the scared Jewish masses of Poland; this was especially true of the Rumanian provinces of Bukovina and Bessarabia. As will be discussed in the Sixth Chapter, this route was used by at least 100,000 Jews. The final distribution of the Jewish population of the former Polish state thus assumes the following shape:

Areas under German control	757,000	(28.8%)
Areas under Soviet control	1,776,000	(67.5%)
Refugees in Rumania	100,000	(3.8%)
<u>Former Polish Jews (end of 1939)</u>	<u>2,633,000</u>	<u>(100.0%)</u>

All of these statistics have been gathered from Polish, Zionist, post-war German and American sources, and they show that no more than 757,000 Jews came under German administration, as German and Soviet armies occupied Poland in 1939.

²¹ Zoller, Henri. "Dunkelheit umgibt uns," *Der Spiegel*, No. 20, 5/11/1981, p. 31.
²² *Krakauer Zeitung*, Krakau, "Noch 1 Million Belgier in Frankreich," No. 195, 8/18-19/1940, p. 4.

How close to reality these figures are may be seen from a piece of information from the Joint Distribution Committee which stated that it had been active in German-occupied Poland without interruption, in the process reaching 630,000 persons in over 400 localities and providing them with food, medical aid, child care, clothing and other economic help.²³ Many more Jews than that simply did not exist in German-controlled former Polish territory!

But what do German sources say about the number of Polish Jews under German control? Unfortunately, the answer is: Nothing. Of course, the Germans spoke of millions of Jews in the occupied Polish territory, but their figures were not based on a census, not even on estimates. They simply used the figures of the last Polish census of 1931 and added a certain number to allow for a natural population growth. In the ghettos the Jews were accorded some kind of self-administration, and the Germans never bothered to count them.

Thus, the *Krakauer Zeitung*, for instance, put the number of Jews in the Government General of Poland at 1.4 million as of the middle of 1940.²⁴ But a closer look shows quickly that this figure matches almost exactly that of the Polish census of 1931, inflated by 10% for the assumed population growth. The huge emigration before the war and the massive Jewish flight to Soviet-occupied territory – a fact which is admitted to by the Zionists themselves – were not taken into account.

After Soviet-occupied, former Polish Galicia was incorporated into the Government General following the outbreak of the Russo-German war, German statements suddenly referred to a Jewish population of 2 million in the enlarged Government General.²⁵

The difference of 600,000 corresponds precisely to the 545,000 Jews living in the added area according to the census of 1931, augmented by 10%.²⁶ In this case, too, the massive Soviet evacuation of the urban population – attested to by German and Zionist sources – was not taken into consideration.

These German figures are not very surprising. For propaganda reasons the Germans were interested in magnifying the “Jewish danger” wherever possible. There are plenty of examples. In the case of Rumania, the German estimate of that country’s Jewish population was 1.5 to 2 million,²⁷

²³ *Universal Jewish Encyclopedia*, Vol. 6, p. 175.

²⁶ *Die Bevölkerung des polnischen Staatsgebiets westlich der Demarkationslinie vom 21.9.1939 nach dem Bekenntnis auf Grund der polnischen Volkszählung von 1931*, Bundesarchiv in Koblenz: Bestand R 153/287.

²⁷ *Krakauer Zeitung*, “Kein Jude in Rumaniens Einheitspartei,” No. 152, 6/29/ 1941, p. 3.

although the Rumanian census found only three-quarters of a million, and even the largest Zionist estimates never exceeded 900,000. As for France, which according to the largest Zionist estimates contained about 300,000 Jews, the Germans mentioned 1.2 million.²⁸ All of these German figures on the Jewish population in other European countries – France, Rumania, Government General – are instances of obvious exaggeration; in truth, the Jewish population was far less than half that size.

What happened to these 757,000 Jews in areas under German control? At the end of June of 1946(!), when the option for a return from the Soviet Union expired for the Jewish refugees of 1939, only 240,489 *registered* Jewish survivors were tabulated in Poland. Of the many hundreds of thousands who had fled to the Soviet Union in 1939, only 157,420 took advantage of this option and returned to Poland. In other words, the primary source which released these figures, the Central Committee for Jews in Poland, a Communist organization, wants to make us believe that only 83,069 Jews of western Poland (240,489 minus 157,420) survived the Second World War under German administration.²⁹ But even *if* these figures were correct, they refer *only* to *registered* Jews. But how many Jews survived the war as “gentiles” in disguise and/or fled to the West between the end of the war and June 1946, never to register at all?

It is possible that hundreds of thousands of Jews used the fourteen months between the end of the war and the deadline to exercise the option to return from the Soviet Union (June 1946) in order to emigrate, flee or be evacuated from Poland; this aspect will be looked into at a later stage. But assuming that all Polish Jews survived the war under German administration, can one imagine a Communist Polish government admit to this in the face of the Soviet declaration at the so-called war crimes trials in Nuremberg that the Germans had killed just about every Polish Jew?

Still, if 757,000 Polish Jews fell under German control, but only 83,069 of them were found “officially” in June 1946, then this amounts to a difference of 674,000 missing Jews – at least statistically.

Jewish Newcomers to the Soviet Empire

Let us summarize: 1.8 million Jews of the former Polish state found themselves overnight in the Soviet sphere of influence; of this number, one million remained for the time being as Soviet Citizens in former eastern Poland, and three-quarters of a million Polish-Jewish refugees, who refused to accept Soviet citizenship, were deported to Siberian labor and concentra-

²⁸ *Kauener Zeitung*, “Die jüdische Pest in Frankreich,” No. 120, 5/23/1942, p. 3.

²⁹ Reitlinger, *Final Solution*, p. 498.

tion camps in the most inhuman manner. This action alone cost the Jews up to 300,000, but at least 150,000, dead according to Zionist data!

In 1940, further large Jewish congregations were to disappear in the Soviet empire, as the Baltic states and parts of Rumania were forcibly annexed. The last censuses in the Baltic countries found the following Jewish minorities:³⁰

Lithuania (1923)	155,125
Estonia (1934)	4,302
Latvia (1935)	93,479
<u>Baltic countries</u>	<u>252,906</u>

As mentioned by the Munich Institute for Contemporary History, the Baltic states, too, witnessed a considerable Jewish emigration before the war. In the case of Lithuania, the last census goes back to 1923, which makes it necessary to allow for the emigration in the 1920s as well. Even if one assumes a relatively much smaller flow of emigration from these three countries than was true for Poland, a net reduction of at least 10% is probably a minimum, particularly as a much longer period of time must be accounted for in the case of Lithuania. A considerable emigration and a low fertility before the war probably added up to no more than 225,000 Baltic Jews coming into the Soviet sphere of influence in 1940.

As will be shown in the Sixth Chapter in some detail, Bessarabia and the northern Bukovina contained 225,000 local Jews at the time of the Soviet occupation in 1940. In addition, there were about 100,000 Polish-Jewish refugees in Rumania. These refugees were spread all over northern Rumania: northern Transylvania, Bukovina and northern Bessarabia. It is not certain how many of these refugees who fled before the German armies in September 1939 lived in Bessarabia and in the northern Bukovina at the time of the Soviet annexation. Jewish sources maintain anyway that 65,000 Jews – most of them apparently of Polish origin – crossed over from Rumanian to Soviet-occupied territory at the time of the Soviet occupation of eastern and northern Rumania.³¹ Furthermore, there is some evidence – see the Sixth Chapter – that 9,000 Polish refugees remained in northern Transylvania when Rumania had to cede that section to Hungary in 1940. Thus, it seems that the Soviet Union obtained not only the 225,000 native Rumanian Jews when it occupied those two Rumanian regions in 1940, but also at least another 91,000 Jewish refugees from Poland.

The territorial expansion of the Soviet Union until June of 1941 thus put 2,317,000 Jews within Stalin's empire:

Polish Jews:

³⁰ *AJYB*, 1940, Vol. 42, p. 602.

³¹ *Ibid.*, 1941, Vol. 43, p. 330.

in eastern Poland and Baltic states	1,776,000	
in Rumania	<u>91,000</u>	1,867,000
Baltic Jews		225,000
Rumanian Jews		225,000
Jewish newcomers to the USSR in 1939/1940		<u>2,317,000</u>

Before the month of September 1939, fewer than 20% (app. 3 million) of the roughly 16 million Jews of the world were subject to Soviet domination. *The consequence of the German-Polish war was that by 1940 one-third of world Jewry found itself within the borders of the Soviet Union.* For the non-Soviet Eastern European Jewry – which had suffered continuous losses during the 1930s due not only to persistent flows of emigration, but also to an excess of deaths over births and changes in religious preference – the Soviet “confiscation” of 2.3 million people of Jewish origin represented a blow from which it was never to recover.

Jewish Population Trends in the Soviet Union

The Soviet census of December 17, 1926, found 2,680,181 Jews.³² Twelve years later the census of January 17, 1939, put the Jewish population figure at 3,020,141 – an apparent increase of 340,000 persons.³³ This change would be equivalent to an annual increase of 1%; but this interpretation of the difference between the two censuses fails to consider some important aspects.

In 1946, the American scholar and professor at Princeton University, Dr. Frank Lorimer, published a book, *The Population of the Soviet Union: History and Prospects*, under the auspices of the League of Nations. In this book he traced important differences in data collection by the Soviets in the censuses of 1926 and 1939. The census of 1926, for instance, was based on the criterion of “*narodnost*” (tribe, ethnic group), which corresponds more to an ethnic “tribal” affiliation than the criterion “*nationalnost*” (nationality) as used in the census of 1939. In any case, the result of these definitional criteria alterations was such that the changes in the numerical size of the various ethnic groups in the USSR from 1926 to 1939 bore little relationship to reality.³⁴

³² Ruppin, Arthur. *The Jews in the Modern World*, London, 1934, p. 26 and 27.

³³ *AJYB*, 1944, Vol. 46, p. 501.

³⁴ Lorimer, Dr. Frank. *The Population of the Soviet Union: History and Prospects*, Geneva (League of Nations), 1946, p. 138.

Soviet Population Counts

Nationality	1926	1939	Changes
Russians	77,791,124	99,019,929	+21,228,805 (+27.3%)
Ukrainians	31,194,976	28,070,404	−3,124,572 (−10.0%)
White Russians	4,738,923	5,267,431	+528,508 (+11.2%)
Jews ³⁵	2,680,181	3,020,141	+339,960 (+12.7%)
Germans	1,246,540	1,423,534	+176,994 (+14.2%)
Others	29,376,171	33,665,747	+4,289,576 (+14.6%)
Total	147,027,915	170,467,186	+23,439,271 (+15.9%)

This juxtaposition of the two censuses seems to reveal three developments:

- a) The Russians, with barely 53% of the total population in 1926, nevertheless furnished 90% of the population increase of the Soviet Union between 1926 and 1939!
- b) The rural Ukrainians decreased by 10%!
- c) The urban Jews increased at a rate which exceeded that of the children-blessed White Russians, and almost equaled that of the rural German population in the USSR!

A comparison of the Jewish population figures for the USSR in 1926 and 1939 thus is bound to lead to wrong conclusions as to the fertility of this minority. In order to ascertain the natural fertility of each of the ethnic groups, Prof. Lorimer investigated the so-called “Child-Woman Ratios,” *i.e.* the number of children aged 0-4 years per 1,000 women aged 20-44 years. For the year 1926 he found the following ratios:³⁶

Needed for permanent population replacement	500
European Russia	844
Russians	832
Ukrainians	871
White Russians	966
Jews	509 (!)
Germans	933

These fertility figures contrast sharply with the purported changes of individual ethnic groups.

Even supposing the enforced collectivization at the end of the 1920s and beginning 1930s caused much greater losses among the Ukrainians than among the other peoples of the Soviet Union, the result of the census of 1939 can only be explained by the changed definitional criteria. The fertility of the Russians was below the European part of the Soviet Union and

³⁵ Dr. Lorimer mentioned a Jewish population of 2,672,499 ; this figure is 6,742 smaller than Zionist sources usually mention.

³⁶ Lorimer, *Population of the Soviet Union*, p. 95 and 96.

– much more important for our analysis – the Soviet Jews had barely enough children to replace themselves. Prof. Lorimer noted:³⁷

The lowest fertility is indicated by the Jews, a predominantly urban and highly literate group. [...] It is apparent that the Jewish population was barely replacing itself [...]

This was true in 1926 already!

It is impossible that the Jewish fertility improved markedly during the following twelve years, because in those years the Soviets initiated a huge program of forced industrialization with an accompanying scarcity of homes and apartments in the cities. In addition, the Jews continued to migrate northward to Leningrad, Moscow and other Russian cities. The pronounced tendency toward mixed marriages between Jews and the native population of the Russian cities certainly added to a still lower fertility of the Jews until 1939.

This is not to deny that there were 3 million Jews in the Soviet Union in 1939. Considering the aspirations of the Jews to assimilate, it is quite probable that the census of 1939 still left several thousands of them uncounted. However, Prof. Lorimer's investigations showed that the Jewish population figure for 1926 was understated to the tune of several hundreds of thousands. The conclusion thus must be that the Jewish population of pre-war USSR was already stagnating, and an excess of deaths over births cannot be excluded altogether.

Of the 2.7 million Jews as published by the Soviet census of 1926, 1,981,487 lived in the Ukraine and in White Russia.³⁸ In 1939 only 1,907,951 Jews were counted in those regions.³⁹ The foregoing illustrations prove, however, that the Soviet census of 1926 had underestimated the Jewish population by perhaps 300,000, or 11%. If this underestimate was distributed rather evenly throughout the Soviet Union, it is possible that the Ukraine and White Russia really had 2.2 million Jews in 1926 instead of the published 1.98 million. Compared to 1939, this represents a reduction of about 300,000 or 25,000 per year.

The north and the east of the Soviet territory, which up until WWI contained only very few Jews, thus must have been populated by the beginning of 1939 by over 1.1 million Jews, the majority of whom lived in Moscow and in Leningrad. The unbelievable migration of Jews from the west and the south is best demonstrated by these two large cities:⁴⁰

³⁷ *Ibid.*, p. 94 and 97.

³⁸ *AJYB*, 1939, Vol. 41, p. 588.

³⁹ *Universal Jewish Encyclopedia*, Vol. 10, p. 24.

⁴⁰ *Encyclopaedia Judaica*, Vol. 11, p. 17 and Vol. 12, p. 365.

Year	Jewish Population in	
	Leningrad	Moscow
1920	25,453	28,000
1923	52,373	86,000
1926	84,505	131,000
1940	200,000	400,000 (450,000) ⁴¹

Obviously, between the two world wars one-third of the Soviet Jews had left the once traditional area of settlement in the west and south of the Soviet Union and moved to the less anti-Semitic north and east.

The *Universal*, too, took account of this enormous migration from the Ukraine and White Russia to the north and east (incl. Siberia) in its calculation of the Jewish population distribution within the Soviet Union. The *Universal* calculated that in 1939 alone the Ukraine and White Russia lost 33,000 (net) of their Jewish population to the east and north.⁴² The basis on which the *Universal* made the estimate is not known – official figures are not available – and, to be conservative, one should not assume that the migration movement accelerated. Therefore, if we limit ourselves to the assumption that the trend existing before 1939 continued until the middle of 1941, this would amount to a net migration loss for both “republics” totaling 63,000 Jews. The Jewish population of those Soviet areas, *i.e.* the north and the east, which were never occupied by German forces, thus could have increased by 63,000 as a result of an internal migration from the south and the west.

According to Zionist sources, on January 17, 1939, 2,092,951 Jews lived in those areas which were later occupied by the Germans during WWII.⁴³ These areas included primarily the Ukraine and White Russia.

In the “free” territories, *i.e.* those regions which never saw German occupation during the war, there were 927,190 Jews at the time of the last census. If one adjusts both parts of the USSR, the “free” and the occupied, by the changes incurred until June 1941 – primarily arising from an internal migration of 63,000 from the south to the north, because the excess of births over deaths, if it existed at all, probably was minimal indeed – then the distribution of the 3.02 million “old” Soviet Jews must have looked something like this:

⁴¹ *Kauener Zeitung*, “Juden-Metropole Moskau,” No. 130, 6/4/1943, p. 2, mentions the same statistics for the years 1920, 1923 and 1926, but none for 1940. On the other hand, this newspaper wrote that the latest published statistical material placed the number of Moscow’s Jewish inhabitants in 1937 already at over 450,000.

⁴² *Universal Jewish Encyclopedia*, Vol. 10, p. 24.

⁴³ Institute of Jewish Affairs. *Hitler’s Ten-Year War on the Jews*, New York, 1943, p. 184.

“Free” Soviet territory	990,000
Soviet territory occupied by German forces in the course of the war	2,030,000
“Old” Soviet Jews in June 1941	3,020,000

Adding it all up, there were 5,337,000 Jews in Stalin’s sphere of influence at the beginning of the war:

Jews “acquired” in 1939/1940	2,317,000
“Old” Soviet Jews	3,020,000
Jews in the Soviet Union in 1941	5,337,000

These figures match just about the numbers as provided by the *Universal*, according to which the Soviet Union contained 5.5 million Jews as of June 22, 1941, after having acquired roughly 2.2 million through the annexation of neighboring areas to the west.⁴⁴ The *American Jewish Year Book* (Year Book) even believes this figure of 5.5 million may be a “conservative estimate.”⁴⁵

Now, if reputable Zionist sources put the number of Jews living in the Soviet Union at the outbreak of the war at 5.5 million – obviously, this figure includes those who didn’t survive the inhuman deportation of 1940 – then they are in effect providing a rough indication of the number of Polish Jews who fell into German hands. In the course of its territorial expansion, the Soviet Union acquired the Jewish populations of the Baltic states – at most 225,000 – and of eastern Rumania estimated at 225,000. If one adds the “old” Soviet Jews of 3.02 million and subtracts the total from the 5.5 million, the remaining figure should correspond with the number of those Jews whom the USSR acquired from Poland; it is about 2 million. This figure exceeds the one arrived at in this analysis by far more than 100,000 and shows the relative conservatism with which our computations were made.

Since Poland had no more than 2¾ million Jews at the outbreak of WWII, it is impossible that more than three quarters of a million Polish Jews could have fallen under German control.

Summarizing the events until the spring of 1941, one obtains the following table:

⁴⁴ *Universal Jewish Encyclopedia*, Vol. 9, p. 670.

⁴⁵ *AJYB*, 1941, Vol. 43, p. 319.

Poland (August 1939)	2,664,000
Soviet Union (1939)	3,020,000
Baltic states (1940)	225,000
Bessarabia and northern Bukovina (1940)	<u>225,000</u>
Total	6,134,000
<i>deduct:</i>	
Polish-Jewish soldiers killed in action	31,000
Polish-Jewish refugees in N. Transylvania	9,000
Polish-Jews under German administration	<u>757,000</u> <u>-797,000</u>
Jews under Soviet domination in (1939/1940)	5,337,000
<i>deduct:</i>	
Jewish losses during the deportation to Siberia in the spring of 1940	<u>-150,000</u>
Jews living in the USSR in 1940 max.	5,187,000
<i>deduct:</i>	
Polish-Jewish refugees in Siberia	600,000
“Old” Soviet Jews in the “free” parts of the Soviet Union	<u>990,000</u>
Jews in the area of the Soviet Union which always remained outside the limits of German military expansion (1940)	<u>-1,590,000</u>
Jews living in the subsequently German- occupied parts of the Soviet Union (spring 1941)	<u>3,597,000</u>

THIRD CHAPTER:

Scorched Earth

Soviet Military Build-up

After Hitler's refusal to accede to further Soviet demands for territorial concessions in Europe, the Soviet Union changed over to a war economy in the summer of 1940; on June 26, 1940, the obligatory eight-hour-workday and the seven-day workweek was decreed in this connection.¹ Other decrees made it a criminal offense if workers arrived more than twenty minutes late for work, punishable by up to six months forced labor. No one was allowed to change jobs except with the written permission of the director in charge; in contrast, the commissariats were empowered to send any worker anywhere in the Soviet Union if they so desired. The Soviet press, the radio, the teachers, the travelling public speakers as well as party, union and youth organization functionaries lectured the population in innumerable meetings that a "Capitalist" attack allegedly planned for a long time was liable to be forthcoming at any time.

The American engineer John Scott, who had been working in the USSR until 1942, described the Soviet preparation for war as follows:²

The Russian defense budget doubled almost every year. Huge reserves of war materials, machines, fuels, food and other supplies were stored. The Red Army grew from about two million in 1938 to 6.5 million men in the spring of 1940.

Already in early 1940, the USSR had gathered 150 divisions in the western military districts, 100 of which were stationed in the former eastern Polish territories, confronting only 6 (six!) German divisions.³

At the end of March 1941, another 500,000 reservists were called up and placed in the military districts bordering the German frontier; they were followed by a further 300,000 specialists from the reserve units. With these measures the Red Army grew a total of 800,000 men just before the

³ Helmdach, *Überfall?*, p. 10.

outbreak of the war. Subsequently, General Zhukov confirmed the mobilization of 170 divisions and 2 brigades in the districts close to the border.⁴

The Swedish air attaché in Moscow estimated that by mid-1941 60% of the Red Army had been positioned in the western Soviet Union, concentrating particularly heavily in areas near the Rumanian border. Obviously, Stalin was aiming at the Rumanian oil fields whose possession would have given him a stranglehold on the German war machine. The Rumanian espionage learned of Stalin's remarks to the effect that the Soviet Government would still have to make great sacrifices in order to gain time, because the coming war could be postponed but it could not be averted.⁵ The Yugoslavian ambassador in Moscow warned Stalin early in 1941 of the German "Barbarossa" Plans; in his reply Stalin speculated on the possible date of the German attack and said: "Let them come. We will be ready for them!"⁶

In April, the Soviet infantry was equipped for military action.⁷ German intelligence discovered that the Russians had been building airports and ammunition depots in feverish haste throughout the entire spring. Polish agents reported Russian troop movements from the Far East to the western border, and the formation and movement of new armies which could only serve aggressive purposes. The Soviets instructed their commissars that they should prepare for a long and cruel war with Germany.⁸ Scientists and party functionaries sent to the Baltic countries from Moscow spoke openly of the Soviet Union's intention to enter the war: The Soviet Union is prepared "to come to the assistance of the European nations suppressed by Capitalism just as it had come to the assistance of the Baltic nations." The start of the war, they said, depended only on the Soviet Union, but first, all of the preparatory work must be finished.⁹ Also, the amply staffed and equipped air support organization established near the border in the center of the frontier with Germany was of a clearly offensive character, because for defensive purposes new airports packed with planes make no sense near the border.¹⁰

After April 7, even the German embassy in Moscow was able to observe the steady call-up of reservists and raw recruits. On April 8, the Russians started to evacuate the families of the members of their trade delegation in Berlin. In Kiev, trainloads of military hardware could be seen moving toward the former Polish border. On April 9, the German military atta-

ché in Bucharest reported that Marshall Timoshenko, regarded by many as the only really capable Soviet general, had called a council of war in Kiev and ordered an alert for all units along the western border.¹¹

The extent of the Soviet military preparations was such that General Halder, the German Chief of the General Staff, feared that – according to his diary entries of April 6 and 7 – the Soviet attack could be expected at any time.¹² General Halder, a member of the “Resistance,” wrote after the war:¹³

[...it] was his [Hitler's] *unshakable and not unfounded conviction that Russia was preparing to attack Germany. We know today from excellent sources that he was right.*

At the political level, too, Stalin was taking calculated steps to solidify his position vis-à-vis Germany. A high point of Soviet hostility toward Germany was reached on March 27, 1941, when Soviet agents in the Serbian army overthrew the pro-German government in neighboring Yugoslavia just two days after Yugoslavia had joined the Axis.¹⁴ Already on April 5, 1941, Stalin hastily signed a treaty of friendship with the new anti-German regime; the following day the German air force attacked Belgrade.¹⁵ Still more ominous from the German point of view was the treaty of neutrality signed by Japan and the Soviet Union on April 13; with this, Moscow was now free to devote all of its attention to the European theater, as the immediately accelerating pace of troop movements from the Far East to the European parts of the country showed.

Hitler and his advisors now had no further doubts about Stalin's martial plans. Halder was sure that, if one would have shown the Soviet military build-up to a neutral military expert, he would have had to admit that it was of an aggressive design. Throughout the month of March the Soviet troop movements near the border were so intense and the supply transports from Moscow toward Smolensk and Minsk assumed such proportions that Halder feared a Soviet attack on Germany could be imminent. At the time, he said that this danger could last until April 20, 1941, because the Soviets were expected to have far superior forces until then.¹⁶

But then, the Soviets knew very well that the Germans had no illusions about the Soviet intentions and were preparing hastily to attain first-strike capability. Already on April 10, high alert was ordered for the entire Red Army.¹⁷ General Klovov of the Politburo announced on April 16 to a select

group of officers that the war could erupt “at any moment” and that the Red Army should not be “caught off guard.”¹⁸

On April 23, new reports of gigantic Soviet reinforcements in the Bukovina and Bessarabia arrived from Bucharest; the following day the German military attaché in Bucharest reported from Bucharest that ships loaded with Red Army men arrived in Odessa and were being transported from there by train to the Bug and Dniester rivers, and that the Soviets were evacuating the *civilian population* along their side of the Pruth river.¹⁹ German intelligence had reported since *February 1940* already that the Soviets were systematically deporting the Polish, Jewish and Ukrainian population from the western Ukraine. The people to be deported were given only a little time to prepare and were allowed to take just a few bags along.²⁰ The accuracy of these reports was verified after the recapture of the former Rumanian areas by the combined German and Rumanian armies. The census conducted by Rumania in the regained territories on August 16, 1941, registered a total population loss of about 20%. The urban population in particular had suffered from the Soviet measures; its share of the total population had shrunk to 10% (before the war it was about 20%). Kishinev, for example, lost 62% of its inhabitants, and Chernovitsy approximately 42%.²¹

In May 1941, several armies were moved from the interior to the western USSR:²²

- The 22. Army from the Ural to the Velikie Luki area north of Vitebsk;
- the 21. Army from the Volga to the Gomel area;
- the 19. Army from northern Caucasus to the Shepetovka area midway between Kiev and the German-Soviet line of demarcation;
- the 16. Army from Transbaikalia (near Manchuria) to the Belaya Tserkov area (southwest of Kiev);
- the 25. Rifle Corps to the western Dvina.

On May 5, Stalin delivered speeches to officers of the Frunse Military Academy. Among the listeners were Molotov, Mikoyan, Voroshilov, Kalinin and Beria; also present were two generals and a major who later happened to fall into German hands and independently reiterated the contents

²¹ Publikationsstelle Wien. *Die Bevölkerungszählung in Rumänien 1941 (Geheim)*, Vienna, 1943: In 1930, Bessarabia and the northern Bukovina had a population of 3.41 million (p. 17); assuming a natural increase of maybe 1.5% p.a., there should have been 4.02 million people in 1941. Deducting the 137,000 resettled ethnic Germans (p. 27), there remain 3.88 million; however, only 3.22 million were found (p. 17) – a decrease by 20%. Kishinev had 140,000 inhabitants before the war (1930: 114,896), but the Rumanians found only 52,962 – a reduction by 62%; Chernovitsy's population of roughly the same size before WWII (1930: 112,427) was down to 78,825 in August 1941 – a minus of 42% (p. 70-73).

²² Helmdach, *Überfall?*, p. 30.

of that speech with a high degree of unanimity. Both Ribbentrop and Göring claimed in 1943 and after the war, respectively, that details of this speech had been forwarded to Hitler by agents almost immediately. The gist of Stalin's speech was:²³

He referred to the need to prepare for the coming war with Germany and promised that within two months the Soviet Union would possess some of the best and fastest aircraft in the world. The war plan, he said, is completed, the airfields have been built, and the frontline aircraft are there already. Everything has been done to clear out the rear areas; all the foreign elements have been removed. Within the next two months the USSR can begin to battle Germany. The pact with Germany was just a trick. A carefully developed, vast partisan movement built up throughout Europe since the war began in 1939 would paralyze the supplies of the German Army. The era of forcible expansion for the Soviet Union has begun.

On May 10, the German Air Force reported the concentration of 4,000 Soviet aircraft on the airfields near the border and the stationing of another 1,000 in rear areas as detected through radio reconnaissance.²⁴

General Vlassov, taken prisoner in 1942, confirmed later that the Soviets intended to attack in late summer of 1941.²⁵ Jacob Jugashvili, Stalin's son who fell into German hands in July 1941 as an artillery lieutenant in an armored division, told his German interrogators "that they were preparing to attack when, suddenly, they [...] were smashed to pieces."²⁶

No doubt, the German preventive action of June 22, 1941, hit the Soviet military build-up before the Red steamroller started to move. Six weeks earlier, on May 12 and 15, the Soviet spy Sorge had reported the imminent attack by 150 German divisions, disclosing the exact date of June 22, 1941, and the German operative plans to Moscow.²⁷

The very first days of the German invasion furnished ample proof that the Soviet Army had indeed been prepared for an attack on central Europe. Even in those frontier pockets extending far to the west around Lvov and Bialystok – which were quite exposed to German encirclement and for this reason were useless for defensive purposes – the German troops encountered massive Soviet assault forces. As a result, the head-on clash with the Soviet army and air force occurred just as soon as the Germans crossed the border.

But since the Soviet high command was limited to just 150-200 air strips adjacent to the German border because of the unfavorable terrain (large parts in the center portion of the German-Soviet border were swampy), the available strips were particularly crowded with planes ready

²⁶ *Ibid.*, p. 99.

²⁷ *Ibid.*, p. 42.

to execute the planned attacks on German positions. Thus, the very first military operations of the German fighter and reconnaissance squadrons encountered numerous airfields of which several were packed with up to 100 Soviet planes. The German air force cut into this massive concentration of several thousand Soviet planes which were ready for the onslaught on Germany. Just between June 22 and 28, 1941, 4,107 Soviet planes were destroyed, about 3,000 on the ground.²⁸ Similar losses were suffered by the Red Army in the Bialystok area. Between June 22 and July 1, it lost 5,774 tanks, 2,330 artillery pieces and 160,000 prisoners, not counting the fallen Red Army men.²⁹

Soviet Policy of Destruction

In his speech of February 25, 1956, at the 20th Party Congress in Moscow, N.S. Khrushchev called Stalin's claim of a German surprise attack a lie and noted that the Soviet leadership knew from many excellent sources (for instance, Churchill; the British ambassador to the USSR, Cripps; the Soviet embassy in London and other Soviet military and diplomatic channels, as well as the Soviet deputy military attaché in Berlin, Chlopov) that the German attack was imminent.³⁰

Also, Stalin's preparations to wage war against Europe were made from a strategic-economic point of view long before Hitler appeared in the political arena as the leader of a resurrected Germany. In contrast to Stalin, Nikolaj Bukharin, who was liquidated in 1938, and other old Bolsheviks favored the development of light industry; they felt that total industrialization could only be pursued once consumer goods were made available to the population. Stalin won the dispute and silenced the others: The Soviet Union thereupon embarked on the most gigantic industrialization program the world had ever seen.

The foundations for this giant undertaking were laid in the first Five-Year-Plan (1928-1932), which called for the establishment of completely new industrial sectors and bases. The core of the Plan was the development of heavy industry in the Urals and in Siberia.

The German army had penetrated the Ukraine in 1918, and a repetition could not be excluded entirely; therefore, in Stalin's opinion the Soviet Union needed a heavy industry located out of reach of possible enemies. In February 1931 Stalin said:

²⁸ *Krakauer Zeitung*, "Die Sowjetflugplätze viel zu dicht belegt," No. 151,711/ 1941, p. 2.

²⁹ *Ibid.*, "Entscheidung von weltgeschichtlichen Ausmaßen," No. 153, 7/3/1941, p. 1

³⁰ Telpuchowski, Boris Semjonowitsch. *Die sowjetische Geschichte des Großen Vaterländischen Krieges 1941-1945*, (Andreas Hillgruber and Hans-Adolf Jacobsen, eds.) Frankfurt am Main, 1961, p. 27E and 28E.

Russia must overtake the most advanced capitalist countries with respect to industrial and military capacity within ten years [i.e. until 1941], or else those countries are going to destroy us.

He emphasized that these new industries would be located in the Urals and in Siberia thousands of kilometers from the nearest border and outside the reach of enemy planes.

In order to attain this goal, thousands of foreign experts were engaged who, while working for the Soviet Union or foreign companies, had to be paid in gold. The American John Scott wrote that in Magnitogorsk alone there were three to four hundred German and American specialists. Relative to general Soviet living conditions, these foreigners enjoyed almost unbelievable luxuries, while millions of men and women died of hunger, froze to death or succumbed to inhuman work requirements and living conditions.³¹

Thus, the naiveté of many Western historians is best demonstrated by their stubborn adherence to the thesis that Stalin, who from the very start concentrated the Soviet Union's forced industrialization in the Urals for strategic reasons only and who was very well informed of German military preventive plans, had been surprised by Germany's attack. The opposite is true. Even before the outbreak of hostilities, the Soviet Union was hurriedly moving people and industrial installations out of the western provinces and districts. John Scott reports that³²

before war broke out, important installations for the production of electrical materials had been moved from White Russia and the area around Leningrad to western Siberia, [and] at least one armaments factory, formerly located near Leningrad, was transferred to Magnitogorsk together with the entire machinery and all of the personnel. [...] Except for the largest blast furnaces, steel making and chemical installations, everything else was transported by rail rather easily to other regions and without significant damages.

According to Prof. Lorimer, the Soviet plans for transporting *people* and machines to the interior were immediately put into action at the start of the hostilities.³³ Prof. Boris Semjonowitsch Telpuchowski from the Institute for Marxism-Leninism at the Central Committee of the Communist Party in Moscow confirmed that this eventuality had been taken into account in the plans to switch the railroad traffic immediately to serve military needs. In the first few months one million railroad cars loaded with industrial equipment, materials and *people* left the endangered areas near the frontline.³⁴

The Germans estimated the Soviet stock of passenger and freight cars at the beginning of the war at 36,000 and 850,000, respectively. At the end of

³¹ Scott, *Jenseits des Ural*, p. 76, 79, 105, 304-305.

³² *Ibid.*, p. 307 and 312.

³³ Lorimer, *Population of the Soviet Union*, p. 195.

³⁴ Telpuchowski, *Die sowjetische Geschichte*, p. 84.

1941, 40% of the Soviet railroad network was in German hands; still the Soviets managed to take the bulk of the rolling stock along with them: At the end of 1941 German troops had captured only 1,100 passenger and 43,300 freight cars³⁵ – almost half of these during the first four weeks. In other words, the Russians were not at all surprised by the German attack; they seem to have expected it.

Assuming that up to 50%, *i.e.* more than 400,000 railroad cars, had their home stations in the areas occupied during the war by German forces, the Soviets obviously were able to evacuate about 90% of that rolling stock before the Germans could lay their hands on them. Of course, all these railroad cars were shipped further east fully loaded. If one adds to these the number of cars arriving from the east carrying military personnel and weaponry, ready to transport people, materials and machines on their return trip, then one can understand how the Soviets managed to evacuate huge masses of people in such a short time; the fact that the areas close to the German border were neither very highly industrialized nor greatly urbanized permitted the use of a correspondingly greater number of cars for the removal of the relatively small urban population. John Scott had this to add:

The Russian railroad tracks running in an east-west direction are crowded with trains bringing supplies and reserves to the front. Going east the freight trains are loaded with machines and workers. Even though I know of no numbers, I am convinced that a large part of the industrial machinery, which was located previously in the areas temporarily occupied by Germany, did not fall into German hands, but is in full operation in Stalin's Ural fortress fifteen hundred or two thousand kilometers east of the frontline of spring of 1943.

The Ural area was capable of producing every type of material required for the production of tanks, heavy trucks, artillery and airplanes. Until the outbreak of the war, two things still were in short supply in that region: machines and labor. "Both," Scott continued, "have been transferred there recently in large numbers."³⁶

Prof. Lorimer confirmed also that the Soviets set out immediately after the German attack to activate their plans for the dismantling of factories and resurrecting them in the interior; in addition, he says, a large part of the agricultural machinery and a lot of livestock was removed. Even Khrushchev admitted that the Soviets succeeded in increasing military production during the war in the eastern sections of the country and to re-install the removed means of production from the western industrial territories.³⁷

³⁵ Reichswirtschaftsministerium. *Die UdSSR Anfang 1942*, (Date unknown), Bundesarchiv Koblenz, Bestand R 24/817.

³⁶ Scott, *Jenseits des Ural*, p. 312-313.

³⁷ Telpuchowski, *Die sowjetische Geschichte*, p. 28E.

The re-use of the machines transported from western regions was facilitated by the circumstance that the Soviet leadership had put up factory shells in the Urals and Siberia long before the war started, ensuring that sufficient electric energy was available. John Scott, an eyewitness to these happenings, wrote:

Railroad and factory construction in the Urals, Central Asia and Siberia was speeded up. [Until the spring of 1941...] Here, new factory buildings rose which were not to be found on any blue-prints. Nobody knew what they were to be used for. At the same time, great efforts were undertaken in order to enlarge the output of power stations even though there was enough power for the local industry, at least in Magnitogorsk.

This, Scott emphasized, occurred only in the Urals region.³⁸

The Soviets had covered the entire Ural industrial region with a fine railroad system and a far-flung network of power lines together with the appropriate power stations. In 1934, the electric power plants in the Ural area produced 2 billion kWh already; in 1940 it was twice as much.³⁹ Until the outbreak of hostilities and during the war, electric power production was increased further. Possibly, these figures are more meaningful to the reader once he realizes that the entire occupied Soviet territory, administered by the Germans under the name of “occupied eastern territories,” with its huge heavy industry produced no more than 10 billion kWh of electrical power *before* the war. As I have shown elsewhere, the Germans were able to produce just 1 billion kWh in this wide area in 1943 despite their utilization of large numbers of German personnel and considerable amounts of German equipment.⁴⁰ Comparisons not only show the extent of the Soviet orgy of destruction, but also the gigantic potential for the production of armaments built up by the Soviets east of the Volga before the war. Telpuchowski describes the Russian measures as follows:⁴¹

The evacuation of industrial enterprises proceeded along a uniform economic plan of mobilization. The plan specified the places of destination where the enterprises were to be transported and the successive turns in which the removal was to take place. The interconnections between the individual factories and plants and their dependence on one another was also taken into account. [...] Hundreds of industrial enterprises were transplanted to the eastern territories. 455 enterprises were moved to the Urals which served as the arsenal of the Soviet Army. In just three months of the year 1941, more than 1,360 industrial complexes were transplanted. The movable equipment of thousands of collec-

⁴⁰ Niederreiter, Wilhelm [aka Walter N. Sanning]. “Verbrannte Erde – Sowjetischer Wirtschaftskrieg im Zweiten Weltkrieg,” *Deutschland in Geschichte und Gegenwart* (Wigbert Grabert, ed.), Tübingen, 29th Year, No.1, 1981, p. 20.

⁴¹ Telpuchowski, *Die sowjetische Geschichte*, p. 81-83, 86.

tive and state farms was transported to the interior. Thanks to the heroic work of the blue- and white-collar workers, the evacuated enterprises rose in a very short time at their new locations. It should be noted that, as a result of the evacuation of the enterprises, the enemy did not succeed in using the industrial stock of the occupied regions for his own purposes as he did in western Europe. Because of the successful removal and re-activation of the enterprises, the main stock of industrial equipment was saved. All of this made it possible that the production of tanks, planes, cannons and other arms could even be increased a few months later. [...] The evacuated enterprises rose in an unbelievably short time at their new localities. The workers and cadres [...] worked under the open sky, quite often in rain and snow. [...] Work continued throughout the day. The workday often lasted from 12 to 14 hours and even more. [...] The assembly of the larger plants and factories was finished in three to four weeks and within 3 to 4 months production attained pre-war levels. On average, one-and-one-half to two months were needed to reactivate the evacuated plants. [...] The falling trend of production was stopped already in December of 1941.

The accessible remains of the secret documents of the German Economy Staff East (*Wirtschaftsstab Ost*)⁴² show clearly that the Soviets succeeded indeed in evacuating a large part of their means of production within the framework of a detailed plan of removal, or at least to make them unusable for the Germans. In this connection, the secret No. 3 Fourteen-Day-Report of the German Economy Staff East dated August 30, 1941, has this to say:⁴³

The Russian and Jewish upper classes withdrew together with the Red Army. The leading Ukrainians have been partially deported and, if they held leading positions in administration and industry, they were also forced to move east of the Dnieper. Numerous tractor drivers and other specialists on the countryside met the same fate. In June, many young men were called up and put in garrisons in the interior of the USSR. [...] Because of this development, there is a tremendous scarcity of people capable of assuming responsible positions in administration, industry and agriculture in the Ukraine. [...]

Extensive economic losses have been sustained because of the systematic clearing and destruction operations of the Red Army before withdrawal. These damages have increased progressively from west to east. In the cities, the damage caused in this way affects factories and stores, and in part also the living quarters and their contents; in the countryside, especially the stock of machinery, livestock, grain dumps and the gasoline supplies of the collective and state farms have suffered.

The clearing action begins usually about 8-10 days before the withdrawal of the Red Army. The critical machines of the enterprises, especially motors, have been removed, carefully packaged and loaded to be shipped to the east of the

⁴² The economic administration of the occupied Soviet areas was in the hands of the so-called *Wirtschaftsstab Ost* (Economy Staff East).

⁴³ *Wirtschaftsstab Ost. Vierzehntagesbericht Wi Stab Ost (3.8.-16.8.1941)*, 8/30/1941, Militärarchiv Freiburg, Bestand RW 31/11.

USSR. Destination addresses found in the Ukraine as a rule point to the Ural industrial area, specifically the region encompassed by Sverdlovsk – Molotov (Perm) – Ufa – Chkalov (Orenburg) – Magnitogorsk. It seems that in that area arrangements have already been made for the re-use of the machines removed from the Ukraine. [...] The destruction usually sets in 24 hours before the Soviet troops withdraw. These actions are prepared carefully and include the burning of smaller factories, the blasting of important machine complexes and apparently also the handing over of supplies to the population to loot (contents of the stores in the cities, grain supplies in rural areas). It is quite obvious that the military resistance met in several places (e.g. the giant power station Dnepro-Ges and the aluminum complex in Zaporoshye as well as the iron works in Dnepropetrovsk) had one purpose only, namely to destroy the remaining important industrial works.

Similarly, the Mid-Month-Report dated December 8, 1941, explained that

the destruction of the city of Kharkov began on October 21, 1941, according to accounts of the population. The destruction was carried out with extreme brutality. In many cases, the inhabitants had their houses burned to the ground before they could vacate them. Without doubt, only the rapid occupation by German troops prevented them [the Soviets] from carrying out their plans to burn down the entire city. [...] Totally destroyed are especially the water works, a bread factory, a large laundry, and by far the largest portion of factory installations. [...] Local inhabitants reported that the systematic clearing of the most important industrial works started in August already and assumed a vast scale. Specialists and their families were forcibly evacuated. Apparently, Kharkov's industry has been re-assembled in a rough-and-ready manner above all in Chelyabinsk (western Siberia). The inhabitants say that they received letters from there, according to which the deportees face a desperate situation, lack of living quarters and hunger. Observations in other places, too, reinforce the impression that the disassembly and removal of machinery follows a detailed clearing plan with the objective of moving important bottleneck equipment to areas not endangered as much in order to restart the production of war materials in substitute factories. Thus, the Soviets not only disassembled and removed machinery, but also smaller equipment and tools.⁴⁴

Even before the war, the lot of the people exiled to the new industrial regions in the Urals and western Siberia was sad indeed. As elsewhere in the USSR, shoes and clothing were practically unavailable in 1939 already, and in 1940 even bread was rationed. Hospitals consisted of barracks, were without running water, brutally hot in the summer, ice-cold in the winter, rarely clean and always overcrowded. In 1938 still, only 25% of the population of Magnitogorsk was fortunate enough to live in houses, whereas 50% were crowded into barracks and other “temporarily constructed hous-

⁴⁴ *Ibid.*, *Halbmonatsbericht Wi Stab Ost* (1.-15.11.1941), 12/8/1941, Militärarchiv Freiburg, Bestand RW 31/68.

es,” and 25% had to be satisfied with so-called “semlianki” (Tatar huts. etc.).⁴⁵ Into this region, deficient in even the most basic civilian infrastructure, the Soviets deported shortly before and after the outbreak of hostilities untold millions of Russians, Jews, Ukrainians and other nationalities of the western Soviet Union.

The hopeless situation of the deportees in Siberia is also evident in the words of the Soviet court historian Telpuchowski who said, referring to the evacuation of millions of civilians,

*the accommodation of the masses going into the millions, who had been evacuated from the areas occupied or threatened by the enemy, posed a serious problem in the hinterland [...] which lacked the most elementary lodging facilities; they had to live in tents and sod huts. Food was scarce.*⁴⁶

Obviously, there are no large differences between Telpuchowski’s description of the Soviet measures and the secret reports of the German Economy Staff East with regard to the desperate situation in the Soviet areas of retreat – with the one exception that Telpuchowski did not think it worth mentioning the application of the inhuman Soviet “scorched earth” policy even towards the infrastructure and supplies critically needed by the civilian population that remained behind.

Soviet Mass Deportations

The Soviet rulers believed that hostilities would break out at the German-Soviet line of demarcation regardless. An evacuation of the “threatened” and “foreign” civilian population near the border was thus entirely possible before June 22, 1941, and was carried out, too, as we learned from Stalin’s speech. When the German naval attaché left Moscow on May 19, 1941 – five weeks before the beginning of the war – taking the train through Soviet-occupied former eastern Poland in the direction of Berlin, he met locked prison trains escorted by blue-uniformed GPU troops deporting “undesirables” from eastern Poland.⁴⁷

The extent of the Soviet deportation program is subject to the most contradictory speculations. Contrary to Edward C. Carter, president of the Russian War Relief, who mentioned 37 millions in September 1942,⁴⁸ the *Year Book* maintains that the German advance was so rapid that the Soviet railroad system was incapable of effecting evacuation to any noteworthy

degree.⁴⁹ The Soviets, anyway, have never actually published figures on the magnitude of this human tragedy.

The task to obtain a somewhat reliable picture is complicated by the fact that there are no exact figures available for the total Soviet population at the beginning of the war in 1941; the census of January 1939 was outdated soon after, because of the Soviet annexation of huge regions on the western border in 1939 and 1940. Of course, the German administration carried out more or less detailed counts of the population present, but a comparison with pre-war figures is difficult, because the borders of the various German administrative districts in the occupied territories were rarely comparable to the administrative and political pre-war borders. The *Reichskommissariat* (RK) Ostland contained the Baltic countries as well as parts of former eastern Poland and of the Soviet-Republic of White Russia. The RK Ukraine included parts of eastern Poland in the west (until Brest-Litovsk) but not Galicia. On the other hand, Rumania not only regained its former provinces of Bessarabia and northern Bukovina, but also annexed a part of the former Soviet-Republic Ukraine, calling it “Transnistria”; towards the east, large parts of the former Socialist Soviet Republic (SSR) Ukraine was subject to German military and not civilian rule. For these reasons, it is necessary to scrutinize the pre-war population of the Soviet Union very closely.

The census of January 17, 1939, found a total population of 170.5 million.⁵⁰ Since the last count on December 17, 1926, the population of the USSR had grown by 15.9%, which corresponds to an annual rate of 1.2%. The natural growth rate, though, must have been much higher, because the enforced collectivization of agriculture in the early 1930s cost the lives of millions of people, especially in the Ukraine. Exact figures, of course, will never be available on the mass starvation of the early 1930s, but a comparison of the census of 1926 (before the forced collectivization) and of 1939 should provide some indications.

A comparison of the two censuses shows that between 1926 and 1939 there was an unbelievably large reduction of those born in the years 1919-1926 – the group which at the time of the Great Hunger in the early 1930s was still of childhood age. Between 1926 and 1939 (peacetime!), this population group shrunk 11%, or 3.5 million, from 31.9 to 28.5 million. The age groups 1899-1918 numbered 60.4 million in 1926 but only 56 million in 1939 – a reduction of 4.4 million or 7.3%! In short, of the 92.3 million Soviet inhabitants who were *less* than 28 years old in 1926, only 84.4 million, or 91.4%, had survived until 1939!

⁴⁹ *AJYB*, 1947, Vol. 49, p. 395.

⁵⁰ Lorimer, *Population of the Soviet Union*, p. 138.

*Soviet Censuses of 1926 and 1939 (in millions)*⁵²

Year	Age (Year)		Census of		Changes	
	1926	1939	Dec. 17, 1926	Jan. 17, 1939	Millions	%
1927-1938	—	0-11	—	47.82	+47.82	(—. —)
1919-1926	0-7	12-19	31.94	28.46	-3.48	(-10.9)
1909-1918	8-17	20-29	32.91 ⁵³	30.64	-2.27	(- 6.9)
1899-1908	18-27	30-39	27.47	25.33	-2.14	(- 7.8)
< 1899	>27	> 39	54.71	37.27	-17.44	(-31.9)
Total			147.03	169.52 ⁵⁴		

Even if one postulates a reduction by 2% as a consequence of a normal mortality for these young age groups in the period 1926-1939,⁵¹ there are still 6.6% whose disappearance must have been caused by the starvation policy; applied to the 92.3 million, this amounts to 6 million people. Applied to the 150 million Soviet citizens at the end of the 1920s, we obtain 10 million people who starved to death – and in this connection we haven't even considered the much higher, hunger-induced infant mortality of those children born after December 17, 1926, but before and during the Great Hunger.

Without the more than ten million victims of the great starvation of the 1930s, the census of January 17, 1939, would have found far more than 180 million people. Compared to the 147 million Soviet citizens of 1926, this would have corresponded to a natural increase of over 22%; since emigration and immigration were almost impossible, this is equivalent to an annual rate of natural growth of 1.8%! Applying this growth rate to the 2½ years from January 1939 to June 1941, the actual Soviet population (excl. the inhabitants of the newly acquired western territories) would have increased from 170.5 million (January 1939) to 178 million (June 1941).

After the incorporation of the Ukrainian and White Russian regions of former eastern Poland and the annexation of Bessarabia and the northern Bukovina, the Soviet population rose by another seventeen million.⁵⁵ In addition, there was the occupation and annexation of the Baltic countries in 1940 with a population of six million.⁵⁶ Finally, many Polish citizens from

⁵¹ Normally, this young age group should have had a mortality of maybe 1% for a 12-year-period; in order to take account of the worse hygienic and social environment in the Soviet Union of the 1920s and 1930s, a mortality of 2% was assumed, even though this is probably too high.

⁵² Statistisches Reichsamt. *Wirtschaft und Statistik*, Berlin, 20th Year, No. 14, 2nd July-issue 1940, p. 290.

⁵³ For 1926, *Wirtschaft und Statistik* provided figures for the age groups 1897/1906, 1907/1911, 1912/1918; for 1939, the age groups 1899/1908, 1909/1918. In order to match the age groups of 1926 and 1939 censuses, three average years were deducted from the group 1907/1911, and added to the group 1909/1918. The group 1899/1908 for 1926 was calculated in a similar fashion.

⁵⁴ The sum does not add up to the final census figure for 1939; the difference applies to the extreme North of the Soviet Union where the census was taken somewhat later.

⁵⁵ *Wirtschaft und Statistik*, 2nd July-issue 1940, p. 288.

⁵⁶ *AJYB*, 1940, Vol. 42, p. 602.

western Poland – Jews in particular – fled in the first half of September 1939 to the eastern parts, which were occupied by the Soviet Union after September 17, 1939.

As a result, the population living in the Soviet Union on June 22, 1941, must have reached at least 202 million. Thus, the findings of the American scholar Prof. Lorimer that the total population of Soviet Russia was about 200 million in those days matches just about our own calculations.⁵⁷

Besides these newly acquired Soviet territories with a population of roughly 23 million (excl. refugees), the German Wehrmacht succeeded in occupying the following “old” Soviet areas, wholly or in part:

*“Old” Soviet Areas under German Occupation*⁵⁸

Region	1,000 sq. km	Population (in 1,000) as of January 17, 1939	
		Total	Cities
White Russian SSR	126.8	5,568	1,373
Ukrainian SSR	445.3	30,960	11,196
Crimea ASSR	26.0	1,127	586
Rostov Oblast	100.7	2,894	1,263
Orel Oblast	64.4	3,482	693
Kursk Oblast	55.7	3,197	286
Voronesh Oblast	76.7	3,551	658
Kalinin Oblast	106.4	3,211	703
Smolensk Oblast	72.2	2,691	448
Krasnodar Kray	81.5	3,173	765
Ordzhonikidze Kray	101.5	1,949	394
Kabardino-Balkar ASSR	12.3	359	85
North Osetin ASSR	6.2	329	155
	1,275.7	62,491	18,605

In addition, large portions of the Stalingrad, Tula, Moscow and Leningrad districts (oblast) had been conquered, but the capital cities of these oblasts always remained outside German control. Without the urban population of Tula, Moscow, Leningrad and Stalingrad, the population of these areas amounted to 11.6 million as of January 17, 1939. If the German forces occupied only a section containing just one fifth of their total population, another 2.5 million must be added; therefore, it seems that the “old” Soviet regions which were occupied by German troops in the course of the war were populated by 65 million people as of January 17, 1939.

Considering, furthermore, a natural increase of about 3 million until mid-1941, the population of all Soviet territory occupied by the Axis armies – including the newly acquired regions to the west in 1939/1940, must have numbered 91 million at the time German-Soviet hostilities be-

⁵⁷ Lorimer, *Population of the Soviet Union*, p. 194.

⁵⁸ *Ibid.*, p. 241 and 242.

gan. This figure comes rather close to Lorimer's own of 85 million;⁵⁹ but Prof. Lorimer obviously didn't allow for a natural population increase in the 2½ years between the last census and the outbreak of the war.

Telpuchowski wrote, "40% of the population of our country [lived] in the area occupied by the enemy until November 1941."⁶⁰ This means that official Soviet sources put the pre-war population of the territories occupied by the Germans until November 1941 at about 81 million (*i.e.* 40% of 202 million). If one adds the additional territory conquered in 1942, it seems that our calculations of 91 million people are almost too low.

German investigations during the war provide a similar picture. In the areas under German control on November 1, 1942, the pre-war population was calculated at 83.81 million.⁶¹ It should be noted that in the meantime there had been some losses of territory due to military reverses by the Germans, so that these figures were already reduced by several millions. If a natural increase until mid-1941 is taken into account, it would seem that 91 million is to be regarded as the absolute minimum prewar population of all the Soviet territories conquered by the German armies.

According to Prof. Lorimer, 31% of the population of occupied "old" Soviet regions was urban before the war;⁶² a similar situation existed in Estonia and in Latvia. However, in Lithuania the urban population was smaller, and it was still smaller in the areas taken from Poland and Rumania.⁶³ All in all, one may say that the total urban pre-war population of the occupied Soviet Union must have been at least 25 million.

Regarding the time and the number of the evacuated civilian population Prof. Lorimer wrote:⁶⁴

Another wartime movement, begun on a relatively small scale at an early stage and augmented just before and after the German attack, was the selective evacuation of such persons as former army officers, government officials and executives, and, later, workers of various kinds from areas annexed by the U.S.S.R. to the interior of the Soviet Union. [...] Kulischer estimates the total

⁶² Lorimer, *Population of the Soviet Union*, p. 194.

⁶³ Reichswirtschaftsministerium. *Gebiet und Bevölkerung der UdSSR*, (Date unknown), Bundesarchiv Koblenz: Bestand R 24/804. The urban population for the areas annexed by the Soviet Union in the years 1939 and 1940 (Baltic countries, eastern Poland, northern Bukovina and Bessarabia) is given as 3.42 million. In order to estimate the urban population before the outbreak of the war in the subsequent German-occupied Soviet territories, one has to add part of the urban population of those Soviet areas which were not fully occupied by German troops, like the oblasts of Stalingrad, Leningrad, Moscow and Tula; we also have to take into account that, since the last census in 1939, continued war preparations and industrialization measures may have forced at least another two million people into the cities.

⁶⁴ Lorimer, *Population of the Soviet Union*, p. 195-197.

number of civilians evacuated from the annexed areas at 1,500,000 to 2,000,000 persons... Finally, we come to the most important population movement in the U.S.S.R. during the war – apart from the mobilization of military personnel, which we shall not attempt to estimate – namely, the planned, selective evacuation from the path of the invader. When the Germans crossed the frontiers, plans were immediately put into effect for the rapid removal of people and equipment. In fact, large-scale evacuation of persons from the annexed areas bordering on the German zone seems to have been initiated at least several days before June 22, 1941. Most of this evacuation was by railway. Whole factories were dismantled and set up in the interior; a large part of the farm machinery and much of the livestock were removed. There is no precise official information about the number of persons evacuated, and widely divergent estimates have been made by competent authorities. [...]

In general, the population of Ukrainian cities in 1942 seems to have been half as large or less than it was in 1939. [...] The depletion of urban population by evacuation may have been less marked in the most western districts of the annexed areas than in the Ukraine as a whole, but scattered Soviet references indicate far greater depletion of population in some other cities, such as Smolensk and Kalinin. German discussions of agricultural problems in the occupied area give added evidence of the large-scale removal or destruction of farm equipment, but indicate the shortage of agricultural labor was not serious except in certain districts. [...] This evidence furnishes some reason for believing the thesis of the Chief of the War Economy Department in the German Economic Administration in the East [Assistant Secretary Dr. Rachner] that the evacuation from the area occupied in 1941 was equal to about half of the urban population, with refugee movements to rural districts about offsetting the evacuation of the rural population. This German authority estimated on this basis that the number of evacuated from occupied to free Soviet territory in 1941 was about 12.5 million persons.

Two estimates by independent authorities, based on an analysis of the railway carrying capacity, result in divergent figures for evacuation from areas occupied prior to 1942. Habicht estimates 15 million as a maximum, and Vassiliev places the total number of evacuees from 7.5 to 10 million. [...] Kulischer estimates the grand total of evacuees from both the annexed and original Soviet territories at 12 million persons, excluding only military personnel mobilized before the German invasion. This is a very possible figure. [...]

In general, these displaced people were located in the area of the Central Industrial Region which had been marked by most rapid expansion during the preceding decade. [...] It would appear that large numbers were located in regions near the Turkestan-Siberian Railway, and that Tashkent was an important distributing point for refugees and evacuees. A great many were assigned to various established and relocated industries in the Central Volga Region, the Urals, western and central Siberia, Kazakhstan, Central Asia, and the Far North. The industrial output of the Ural region is reported to have increased threefold during the war.

Referring to these Soviet measures, the Zionist author Reitlinger wrote:⁶⁵

[...] it became the Russian policy to remove the working population so that the towns should not benefit the enemy. [...] Not to consent to be evacuated was regarded as a hostile act, often visited with dire consequences later.

And the Jewish Chief of the Soviet Information Bureau, S.A. Lesovsky, announced the official version of the Soviet Government with these gory words:⁶⁶

In fact, the Germans never did occupy any territory with a population of 75,000,000. Well aware of the wolfish proclivities of the Nazi plunderers, ravishers and murderers, the mass of the Soviet population departed beforehand for the Eastern districts of the Soviet Union.

The fourteen large Ukrainian cities listed by Prof. Lorimer were evacuated by 53% on average. However, Prof. Lorimer did not take into consideration that these cities must have had a much larger population in mid-1941 than in early 1939. At the start of the First Five-Year-Plan (1928) blue- and white-collar workers represented just 17% of the Soviet population according to Molotov's remarks at the 18th Party Congress in 1939, but eleven years later, in 1939, their percentage was 50%.⁶⁷ This revolutionary industrialization policy of the Five-Year-Plans not only had an enormous effect on the societal composition of the masses, but on the growth of the cities as well. The 174 cities with 50,000 or more inhabitants in January 1939 contained a total population of 34.1 million (1939) compared to only 16.2 million in 1926; this is equivalent to a rate of increase of 6.5% annually during this 12-year-period.

But the 14 Ukrainian cities as listed by Prof. Lorimer registered "only" a per annum growth rate of 5.5% since 1926.⁶⁸ There is no reason to assume that the expansion of Soviet cities slowed between 1939 and 1941 while preparations were made for the coming war with Germany; the opposite is true, as the feverish war preparations of the Soviets made a still more rapid industrialization necessary. The assumption is not far-fetched that the cities listed by Lorimer – Kiev, Odessa, Dnepropetrovsk, Zaporozhye, Mariupol, Krivoi Rog, Nikolaev, Dneprodzerzhinsk, Poltava, Kirovograd, Kherson, Shitomir, Vinnitsa and Melitopol – evidenced large rates of growth after January 1939 also.

Assuming a rate of increase somewhat less than the average of the past twelve years, let us say 10% for the 2½ years from January 1939 to June 1941, those fourteen Ukrainian cities must have had a total population of over 4 million when the Germans crossed the border. Following the occu-

⁶⁵ Reitlinger, *Final Solution*, p. 228.

⁶⁶ Institute of Jewish Affairs, *Hitler's Ten-Year War*, p. 184.

⁶⁷ *Wirtschaft und Statistik*, 2nd July-issue, p. 290.

⁶⁸ Lorimer, *Population of the Soviet Union*, p. 196,250-252.

pation of these cities, the Germans found only 1.69 million inhabitants; thus, the Soviets succeeded in evacuating almost 60% of their urban population. Applied to the entire urban population of more than 25 million, this would mean that only ten million inhabitants remained in the cities when the Germans arrived; the other 15 million had been removed by the Soviets before the Germans reached the cities.

Reitlinger, too, noted categorically in his book *The Final Solution*: “In most captured towns *less than half the population* stayed.”⁶⁹ Dr. Rachner commented in the *Reichsarbeitsblatt*:⁷⁰

[...] in general, one can assume that the countryside in the occupied areas has suffered no loss of its population. Granted that the occupied regions contained a total population of 75 million before the start of hostilities, about 50 million of these were living in rural areas. If one assumes this population to be still present and needed – one should note that agricultural work had to change over in part to more manual labor because of the loss of machinery – then a figure of 25 million is left for the cities of the occupied areas. Investigations show, though, that only one half of the [urban] population was left at most; this is equivalent to 12½ million.”

One should not forget that Dr. Rachner’s remarks were made in early 1942 when German population counts had only started. To what extent political considerations colored his statements is uncertain. The Soviets in any case were busy exploiting the success of their policy of evacuation, destruction and sabotage propagandistically in every way. The Japanese Government was so impressed by the Soviet propaganda that the Japanese ambassador in Berlin, Oshima, notified the German Government to this effect with the accompanying request to supply him with data on the raw material and production situation in the agricultural and industrial areas of the Ukraine and White Russia, as well as the size of the population under German administration, especially in the Ukraine; he wanted to forward this information on to Tokyo to counter Soviet reports.⁷¹ One should certainly assume, therefore, that Dr. Rachner’s evacuation figure of 12½ million people evacuated by the Soviets probably tended to be somewhat too rosy.

In any case, Inspector Krüger of the Chief Group Economy, Statistical Department, in the Economy Staff East noted on February 17, 1943, in a secret report that the population of the so-called “occupied eastern territories” contained a population of 70 million before the war and that only 50

⁶⁹ Reitlinger, *Final Solution*, p. 228.

⁷⁰ Rachner, Dr. “Der Arbeitseinsatz in den neu besetzten Ostgebieten,” *Reichsarbeitsblatt* (published by the Reichsarbeitsministerium), Berlin, 22nd Year, No.7, March 5, 1942, p. V 131.

⁷¹ Letter of February 10, 1942 from the Oberkommando des Heeres, GenStdH/Attacheabteilung, to the Reichsminister für die besetzten Ostgebiete, attn. Reg.Rat Disch, Berlin; Militärarchiv Freiburg, Bestand RW 31/134.

million had been found.⁷² The “occupied eastern territories” mentioned by Krüger included only the *Reichskommissariats* Ostland and Ukraine, which were under civilian administration, and the military-ruled areas east of them. They did not include the population of the district of Bialystok and Galicia, which was incorporated in the Government General of Poland, the provinces of northern Bukovina and Bessarabia regained by the Rumanians, and the so-called “Transnistrian” part of the former SSR Ukraine. The total population of these excluded former Soviet territories, which were administered neither by the Economy Staff East nor by the German military, probably contained at least 13 million people before the war. However, if one can assume that these areas, too, because of their proximity to the German border and their relatively small urban population, lost only 15% of their population, which was the percentage missing in the RK Ostland, then the Soviets could have evacuated 2 million of these 13 million people.⁷³

Finally, adding a natural increase of perhaps 4 million likely to have occurred in the period between January 1939 and June 1941, it seems that the area which was in German hands as of February 17, 1943, must have contained 87 million people before the war, the whereabouts of only 61 million of whom, however, could be traced; 26 million, or almost 30%, had disappeared!

Other German sources, too, point to a similar figure. The *Deutsche Zeitung im Ostland*, for instance, reported in 1943 that the losses of the Soviet Union in terms of soldiers and resident population in the lost territories must be put at *at least* 70 million.⁷⁴ Deducting the many millions of Soviet prisoners in German custody and fallen Red Army soldiers, the remaining figure for the Soviet population in German-occupied territory was about 60-65 million.

Indications are that Dr. Rachner’s figures on the number of the deported Soviet population were too small and that Stalin’s propaganda of having denied the Germans a large portion of the human and industrial stock in the occupied areas – and, from the point of view of martial requirements, the most important part at that – matched reality more closely than the Germans might have wished.

⁷² Wirtschaftsstab Ost (Krüger, Chefgruppe W, Statistik). *Bevölkerung in den besetzten Ostgebieten*, Berlin, 2/17/1943, Militärarchiv Freiburg, Bestand RW 31/260.

⁷³ The 1930 census recorded a total population of 2,864,402 in Bessarabia. Natural growth of this largely agricultural population probably was at least 1.2% p.a. Thus, until mid-1941 there should have been an increase by over 380,000 to at least 3,245,000. But the Rumanian census of August 1941 taken immediately after that region’s liberation from the Soviet yoke found only 2,733,565 inhabitants (Publikationsstelle Wien, *Die Bevölkerungszählung in Rumänien*, p. 51) – more than half a million persons, including almost the entire Jewish population, was missing. This amounts to a loss of more than 15%.

⁷⁴ *Deutsche Zeitung im Ostland*, “Die wehrwirtschaftlichen Verluste der Sowjetunion.” No. 14, 1/14/1943, p. 6.

These figures are supported by an analysis of the Chief of Supply of the 200th Rifle Division of the 5th Army on the “Perspectives on the Supply Situation of the USSR in the Winter Campaign 1942/1943.”⁷⁵ The study notes that 65 million people lived under Axis administration in all of the regions taken from the Soviets (as of autumn 1942). The author of the analysis assumed, however, that 100 million people had populated that area before the war and thus arrived at an evacuation figure of 35 million – probably erroneous. If, as explained, that region actually contained only 91 million, this estimate, too, would arrive at 26 million evacuated.

On the other hand, it is rather interesting that this German figure of 35 million is almost a duplicate of the 37-million-number of the American Edward C. Carter. Carter’s number, however, apparently includes not only the evacuees from the German-occupied territories, but also the civilians evacuated from endangered cities near the frontline – *i.e.* Leningrad, Moscow, etc. – which were never conquered by the German armies. As vice chairman of the American Institute of Pacific Relations and president of the Russian War Relief, Carter was indeed well placed to size up the entire extent of Soviet evacuation actions. The Russians knew why they decorated this gentleman with the Order of the Red Banner of Labor.⁷⁶ In any case, Carter’s figure is an indication that our computations of over 25 million evacuees from the German-occupied areas are about correct. Already in mid-November 1941 – less than five months after the Russo-German war began – Andrew Grajdanzev mentioned an evacuation and refugee figure of 10 to 20 million in the *Far Eastern Survey* published by the Institute of Pacific Relations; in this number the men called to arms from the occupied areas hadn’t even been included.⁷⁷

In his distorted description of the German administration of the “occupied eastern territories,” the Jewish author Alexander Dallin, too, specifies the size of the population under German control at 65 million.⁷⁸ But the “most official” Allied statistic on the number of the people remaining behind in German-occupied Soviet territory came from Wendel Willkie, the presidential candidate of the Republican Party in the United States. In September 1942 Willkie visited the Kremlin where he was briefed on the military and economic situation of the battered Soviet empire. On September 26, Stalin hosted a dinner for Willkie; other Soviet notables present at the dinner were Molotov (Foreign Affairs), Mikoyan (Foreign Trade), Beria (Secret Police), Marshall Voroshilov, Admiral Kuznetsov and Infor-

mation Director Alexander Sherbakof.⁷⁹ On that occasion Willkie detailed the requests and information provided to him by the Soviet leadership stating that at least 60 million Soviet citizens were now living in the Soviet areas occupied by the Germans.⁸⁰ The release of this figure by Stalin to Willkie represents an official, though indirect, Soviet admission of the magnitude of their evacuations – up to 30 million people. It is not possible to pin down the evacuees to the exact million, but concluding the subject one may state that the people evacuated and deported to the Urals and Siberia – including the mobilized men – must have numbered more than 25 million; of these, over 15 million came from the cities in the occupied Soviet areas.

These evacuation and deportation measures of the Soviet rulers must be seen in the context of the Soviet policy to wage war. Everything which could aid the German enemy in any way had to be destroyed or at least removed. This strategy affected not only the countryside, the factories, the infrastructure, etc. but also, or rather especially, people; after all, it had to be prevented – by means of evacuation, deportation or mass murder – that the Germans could lay their hands on trained specialists ready to be integrated into their war machine. The leading and industrial sections of the population, of course, were given “preferential” treatment in this evacuation program. So far, the extent of this horrendous action has not been given the attention in the literature which it deserves.

Vacated Cities

Soon after the occupation of the various Soviet cities, the German authorities began to initiate detailed counts of the remaining population. Obviously, the German occupiers had to obtain some information on the available stock of the working population. In this connection, Dr. Rachner wrote,

*the labor service offices [...] were instructed again and again to obtain exact data on the local population based on the methods used in Germany. [...] It should be noted that in most places not only the unemployed have been recorded but also those employed in the factories and in the public offices, classified by professional groups and types.*⁸¹

In addition, the Soviet policy of systematic destruction of food supplies caused a stinging crisis in feeding the local population; just to carry out an effective program of rationing, it was necessary to obtain an exact count of

⁸¹ Rachner, *Reichsarbeitsblatt*, 3/5/1942, p. V 131 – V 132.

the population. Understandably, these population censuses were handed to the press only intermittently, and the war documents in German archives today are so incomplete that, as far as we know, there are only very few cities for which evacuation figures are available.

The Soviet cities listed on *Table 6* have been grouped regionally former – Baltic, eastern Polish, Rumanian and “old” Soviet – in the rough order of their occupation. Quite noticeably, the Baltic cities’ evacuation rate of “only” 26% is very much lower than those of the “old” Soviet and former Polish cities. Furthermore, the table furnishes no evidence that the cities conquered later in time registered a higher deportation loss than those cities occupied in the very first days of the war.

It is not clear to what extent these listed cities are representative for all occupied urban centers; nevertheless, they constitute almost one fourth of the urban population present in the German-occupied areas at the beginning of the war. The average evacuation rate of 50% is almost certainly too low. *Table 6* shows that the Slavic cities suffered much more extensive deportations; unfortunately, rates were available for only one-fifth of the urban inhabitants of the Slavic cities, which made up the lion’s share, while in the case of Baltic cities – whose urban population amounted to just six per cent of the pre-war population of all Soviet cities occupied by Germany during the war – data for more than half the urban population was available. In short, the Baltic cities are overrepresented in *Table 6*; but inasmuch as they registered relatively low evacuation losses, the average evacuation rate for the entire Soviet urban population turns out to be too low.

 - gg) *Deutsche Zeitung im Ostland*, “Der Blutverlust des estnischen Volkes,” No. 213, 8/6/1943, p. 5.
 - h) The last available census figures for Polish cities exist for 1931; from these it is possible to infer that the natural increase in Poland must have been around 1.5% annually. During the economic difficulties of the 1930s the rate of growth decelerated, but the pace of urbanization continued unabatedly. The average growth of the Polish cities during the 1930s was, nevertheless, set at only 20% in order to remain on the cautious side.
 - i) The population figures of the Polish census for the listed cities may be taken from *Table 4*.
 - j) *Zentralblatt des Reichskommissars für die Ukraine*, Rovno, No. 2/2, January 9, 1943, p. 8-20.
 - k) Institute of Jewish Affairs. *Hitler's Ten-Year War on the Jews*, New York, 1943, p. 186.
 - kk) Publikationsstelle Wien. *Die Bevölkerungszählung in Rumänien 1941* (Geheim), Vienna, 1943, p. 70-73: On August 16, 1941 – before the Rumanian deportations of parts of the Jewish population to Transnistria – a census was conducted in the regained provinces of northern Bukovina and Bessarabia: In Chernovitsy only 78,825 inhabitants (1930: 112,427) were found, and in Kishinev just 52,962 (1930: 114,896); the population of these cities must have increased by at least 20% between 1930 and 1941.
 - l) *Deutsche Ukraine-Zeitung*, 3/8/1942.
 - m) As mentioned in the text already, between 1926 and 1939 the Soviet cities experienced a population growth of 6.5% per annum (in the Ukraine 5.5%). For the listed “old” Soviet cities the figures were raised 10% above that of January 1939; considering the preparations for war against Germany and the continuing industrialization efforts, this must be viewed as a minimum.
 - n) Lorimer, Frank. *The Population of the Soviet Union: History and Prospects*, Geneva: League of Nations, 1946, p. 250-253. Prof. Lorimer lists the following population figures for 1939: Kiev (846,293), Odessa (604,223), Dnepropetrovsk (500,662), Zaporozhye (289,188), Minsk (238,772), Mariupol (222,427), Krivoi Rog (197,621), Taganrog (188,808), Nikolaev (167,108), Smolensk (156,677), Dneprodzerzhinsk (147,829), Poltava (130,305), Kirovograd (100,331), Kherson (97,186), Shitomir (95,090), Vinnitsa (92,868), Melitopol (75,735), Chernigov (67,356).
 - o) Reitlinger, *Final Solution*, p. 223; *Kauener Zeitung*, “Die Stadt Minsk im Aufbau,” No. 298, 12/19/1942, p. 5, mentions the same figure.
 - p) The pre-war population of Novograd Volynsk is unknown, but must have been between 20,000 and 30,000. Regarding the number of the evacuated, there are contradictory reports, German investigations (for source see footnote j above) found 12,000 inhabitants, but the Zionist Institute of Jewish Affairs (*Hitler's Ten-Year War*, p. 186), maintains that 90% of the population had withdrawn with the Red Army.
 - q) Institute of Jewish Affairs, *Hitler's Ten-Year War*, p. 196.
 - r) Census figures for 1939 are not available in the case of Proskurov and Kamenets-Podolsk; the last obtainable were for 1926. Even though the urban population in the Soviet Union more than doubled between 1926 and 1941, we assumed only an increase of 50%.
 - s) According to the *Encyclopaedia Judaica* (Vol. 13, p. 1195), 13,408 Jews lived in Proskurov in 1926, constituting 42% of the population; this means that the total population of the city in 1926 must have been 32,000. In Kamenets-Podolsk were 12,774 – 29.9% of the population; thus, this city's total population must have amounted to 42,700.
 - t) Institute of Jewish Affairs, *Hitler's Ten-Year War*, p. 185; *Kauener Zeitung*, “Odessa – Laune einer Zarin,” No. 182, 8/6/1942, p. 3, mentions the same figure for Odessa.
 - u) *The New York Times*, 1/27/1942.
 - v) *Deutsche Ukraine-Zeitung*, No. 57, 3/29/1942.

w) *Ibid.*, No. 175, 8/14/1942.

- x) This figure probably is too low by one-quarter of a million because
- (1) for some cities no Jewish population is known at all, and
 - (2) in the case of several “old” Soviet cities, only the population figures for 1926 could be obtained; not only did the Soviet census of 1926 understate the Jewish population, since 1926 the huge industrialization program had been set in motion, in the course of which many rural Jews migrated to the cities.

The weighted average – evacuation rates of Baltic and Slavic cities multiplied by their share of the pre-war population – is nearer 55%:

	Baltic Cities	Eastern Polish Cities	Eastern Ruman. Cities	“Old” Soviet Cities	All Soviet Cities
Rate of evacuation as shown in <i>Table 6</i> :	26%	60%	52%	56%	50%
Weight: Share of the Baltic, eastern Polish an “old” Soviet urban population in per cent of the entire urban population of the regions later occupied by Germany	6%	11%	3%	83%	100%
Probable evacuation rate of the entire pre- war urban population of the occupied So- viet territories	1.6%	6.6%	1.6%	45%	55%

In order to show the varying degrees of evacuation more clearly, these 48 cities were divided into three groups – according to the severity of population loss – and entered on *Chart 1*. As expected, the Baltic cities are to be found in the group with the lowest evacuation rates, while the Slavic cities – with few exceptions – showed high evacuation rates throughout. It even appears that the western Soviet cities suffered greater percentage losses than those further east!

The element of surprise, which is cited regularly today as one reason for the swift German advance, cannot be substantiated from the evacuation and deportation rates. Surprising is rather that the Soviet cities near the German frontier, occupied in part by German troops during the very first days of the war, had up to two-thirds of their population removed by the Soviets.

Certainly, the high rates of evacuation for the White Russian and western Ukrainian cities prove two points:

- a. Prof. Lorimer’s findings, that the Soviets had begun to evacuate the civilian urban population near the frontier some time before war erupted, are correct, and
- b. the assertion that the fast German advance delivered the largest part of local urban population into German hands is simply wrong!

These numbers show quite clearly that the clearing actions of the Soviets were extremely successful. Even though millions were evacuated by force, the Soviet measures were facilitated by the circumstance that a large number of the evacuees moved willingly, at least without much opposition.

This is especially true of Ukrainian communists in leading positions, and probably even more so of the non-Ukrainians who controlled the peasant Ukrainian population in this Soviet Republic in the name of Moscow – the Russians and the Jews.

Ukrainians were in the minority in their own cities; only 47.4% of all city people in the SSR Ukraine were Ukrainians, and the remaining 52.6% were largely accounted for by Russians (25%) and Jews (23%). Both of these latter two nationalities occupied most of the important positions in industry, party and administration; in the eyes of the Ukrainians they represented the long and heavy hand of Moscow. The entire grotesque situation is depicted in the professional structure of Ukraine's pre-war population:⁸²

Education and Professions	Ukrainians	Russians	Jews
1) Among 1,000 inhabitants were in			
– primary colleges	8%	13%	24%
– secondary colleges	10%	24%	60%
2) Public officials and employees:			
– enterprise management	34%	20%	41%
– “arts”	27%	31%	36%
– doctors and medical aides	38%	23%	32%
	(mainly orderlies)		(mainly doctors)
3) Industrial blue- and white-collar workers	40%	22%	32%
4) Construction	38%	51%	?
5) Mining	31%	58%	?
6) Servants	60%	28%	5%

Naturally, the much larger income disparities in the Soviet Union enlarged the gap between the masses of the Ukrainian population on the one side and the Russians and especially the Jews on the other. John Scott, for example, mentions the following earnings patterns for 1933:⁸³

Untrained laborer	100	rubles	monthly
Qualified worker	300	"	"
Engineer (without experience)	400-500	"	"
Engineer (practical experience)	600-800	"	"
Administrators, directors, etc.	800-3,000	"	"

Whatever changes in income may have occurred until 1941, it is certain that there was no equalization of the drastic income disparities in the interim period.

The Ukrainians not only constituted a minority in their own cities, they were the real proletarians, while Russians and Jews occupied the socially

⁸² *Deutsche Ukraine-Zeitung*, “Ukraine auf dem Weg nach Europa,” 2/22/1942, p. 3.

⁸³ Scott, *Jenseits des Ural*, p. 63.

and economically more lucrative positions. The idea that the subjugated Ukrainian population might not behave very friendly towards the Russian and Jewish upper classes after liberation from the Soviet yoke certainly must have crossed the mind of many of these “foreigners.” Under these circumstances, an evacuation must have appeared as the lesser evil to large sections of both minorities in the Ukraine. In White Russia, the situation was not very different.

For the Soviet government this proved to be a favorable starting position from which to evacuate the urban population. The politically more reliable non-Ukrainian population groups accounted for more than 50% of the urban inhabitants. Secondly, the two large minorities – Russians and Jews – occupied mostly leading and specialist positions in industry and administration, whereas Ukrainians were to be found largely in the lower ranks. Thirdly, the two population groups which were most valuable under the circumstances on account of their better training, experience and attitudes, *i.e.* the Russians and the Jews, showed a considerably greater willingness to go on the uncertain journey to the east.

The fact that the evacuated population included a relatively large share of women and children must be explained by the phenomenon of the eminent role of women in the economic life in Communist societies; no doubt even a dictatorship would find it difficult to separate these working mothers from their children. Also, considerations of maintaining morale in the case of these minorities certainly called for the evacuation of the closest relatives as well.

Quite obviously, the Soviet evacuation measures were very well organized in anticipation of the coming German-Soviet conflict. If, as happened in Melitopol and Mariupol, both of which fell into German hands in the autumn of 1941, a relatively large part of the population remained behind, this was simply the exception to the rule. German war reports mention that both cities were taken by surprise action – apparently catching the Soviets off guard – and that for this reason the destruction inflicted by the Soviets was relatively minimal. Another indication of the Soviet expectation of the German attack is the Soviet success of taking with them almost the entire rolling stock of their railways: 40% of the railroad network was in German hands, but they captured only 5% of the rolling equipment.

Finally, reports of the German administration of the conquered territories provide a glimpse of the single-mindedness with which the Communists carried out their evacuation program. We mentioned before that non-Ukrainian population groups dominated Ukrainian cities. German publications show, though, that this picture changed drastically in the course of these evacuations. Many cities, *i.e.* Vinnitsa, Dnepropetrovsk, Kirovograd, Chernigov, Kherson, etc., all of a sudden had a Ukrainian majority, which

in some cases attained 80% and more.⁸⁴ In other words, the Soviets geared their evacuation actions to very particular population segments, namely public officials, party functionaries, specialized industrial blue- and white-collar workers, artisans and the so-called intelligentsia. But since the Ukrainians had been regarded to be politically unreliable, educational and other training facilities were made available to them within narrow limits. As a consequence, the Ukrainian – unless he was active in agriculture – usually performed the less demanding jobs. In short, in their understandable attempt to save that part of the population which was most valuable for their own war effort, and *vice versa* to prevent the Germans from making use of their skills, the Soviets evacuated above all the Russians and the Jews.

Therefore, the obviously much higher evacuation ratios for the Slavic regions as compared to the Baltic countries are not the result of longer periods of preparation before the war. Decisive was whether or not the cities contained large minorities which, at the same time, were dominant in the management of enterprises and in public administration. These criteria were met by the Ukrainian and the White Russian, but generally not by the Baltic cities. It is no coincidence that the Latvian cities of Daugavpils and Rēzekne registered large evacuation ratios. In this exceptional case, the native Latvian population was in the minority in both cities, while the Russian and Jewish inhabitants together accounted for 40% to 50% before the war; in contrast, the remaining urban population of Latvia was largely of Latvian origin, with the Russian and Jewish elements averaging about 17%.⁸⁵

Chart 1 shows the eastern frontlines as of July 1, July 11 and August 20, 1941. It also shows which Soviet cities were occupied (or encircled) by Axis troops within the first ten days, during the second ten-day period, and the following 40-day period, and after the sixtieth fighting day. The evacuation ratios for the cities were taken from *Table 6*.

Comparing these four time periods with the average evacuation ratios of the Baltic and Slavic cities, one obtains a remarkable development (*Table 7*). In general, Ukrainian and White Russian cities occupied during the first ten fighting days and containing large Jewish populations had been more thoroughly evacuated by the Soviets than the Slavic cities to the east, which were occupied as late as September and October.

Also, the fact that the evacuation ratios of the Baltic and Slavic cities did not increase as time elapsed but actually decreased, allows the following conclusions to be drawn:

- a. The Soviets did indeed begin to evacuate the frontier towns before the start of the hostilities. This action was facilitated by the circumstance

⁸⁴ *Deutsche Ukraine-Zeitung*, 2/15/42, p. 3; 2/25/42, p. 3; 3/29/42, p. 3; 5/17/42, p. 3; 7/10/42, p. 3.

⁸⁵ Publikationsstelle Berlin-Dahlem. *Bevölkerungsstatistik Lettlands* (Joh. Papritz and Wolfgang Kohte, eds.), Berlin, 1942, p. 10/11, 42/43, 46/47.

that the western Soviet regions were not very highly industrialized and that the urban population was accordingly relatively small.

- b. As the German military successes continued, the industrial areas were drawn into the fighting arena; consequently, it became more and more difficult to withdraw not only the retreating Red Army, but also the growing volume of machinery and the millions of the civilian population; as a result, the evacuation ratios for the cities began to decrease as the war progressed.

Table 7: Soviet Evacuation of Baltic and Slavic Cities by Periods of Time

Period of German Occupation	Evacuation in Per Cent	
	Baltic Cities	Slavic Cities
1st – 10th day of war (6/22 – 7/7/1941)	29%	60%
11th – 20th day of war (7/2 – 7/11/1941)	25%	59%
21st – 60th day of war (7/12 – 8/20/1941)	21%	55%
After the 60th day of war (after 8/20/1941)	–	54%
	26%	57%

Source: *Chart 1 and Table 6.*

The size of the cities was of no major consequence for the evacuation program. Large cities with a population of a quarter of a million and small towns with fewer than 50,000 inhabitants were treated alike; all of them averaged evacuation ratios of around 50%.

Number of Cities	City Size (in 1,000)	Pre-war Population	Evacuated Inhabitants	
			Persons	Per Cent
6	> 250	3,150,500	1,744,539	55%
21	50-250	2,744,696	1,238,862	45%
64	< 50	658,900	299,679	45%

(Note: The low evacuation rate of the smaller towns is due to the relatively large number of small Baltic cities in this group.)

There are no indications whatsoever that the distance from the German frontier or the size of the city had any direct connection with the extent of the evacuation. The Soviets concentrated their evacuation efforts above all on the White Russian and the Ukrainian cities with their large, dominant minorities – the Russians and the Jews.

Depopulated Ukraine

The German authorities embarked on a rather extensive program of registering the population that remained behind. Unfortunately, the largest part of these statistics is not obtainable. But even the sorry remains provide

enough clues to permit a size-up of the Soviet evacuation effort. Regretfully, precise pre-war figures which would allow an exact determination of the extent of the evacuation are not available either.

The local population living under German administration in the RK Ukraine numbered 16.91 million as of January 1, 1943. The total number of inhabitants – classified by general districts, areas and counties – was published in the *Zentralblatt des Reichskommissars für die Ukraine*.⁸⁶

General District	Area in sq.km	Inhabitants
1. Wolhynia-Podolia	80,508	4,211,916
2. Shitomir	64,800	2,916,890
3. Kiev	71,790	4,455,927
4. Nikolaev	46,880	1,920,253
5. Dnepropetrovsk	52,398	2,743,041
6. Crimea (Tauria)	22,900	661,981
RK Ukraine	339,276	16,910,008

German estimates of the pre-war population pertain either only to January 1939 or else they just mention rough ranges within which the probable pre-war population size was estimated to have been. *The Jahrbuch für Weltpolitik 1943*, for example, cites the figure of 21.5 million without mentioning the year to which it applies.⁸⁷ The context, however, makes it apparent that the above figure refers to the year 1939, as far as “old” Soviet areas are concerned, and to the year 1931 for the former eastern Polish areas located in the RK Ukraine. If one adds the population increase likely to have occurred between those dates and mid-1941 – perhaps 1.2 million – the pre-war population of the RK Ukraine must have numbered *more* than 22.5 million; however, the Germans found less than 17 million. One-quarter of the population had disappeared.

The secret documents of the German Economy Staff East put the number of the pre-war population in a range between 20 and 25 million; this, of course, could not be used as a basis for calculating the evacuation ratio.⁸⁸

Luckily, the Soviet census of 1959 provided some comparable statistics for the year 1939.⁸⁹ These indicate that those Ukrainian oblasts which remained outside the RK Ukraine under German military rule contained 10.98 million people in early 1939, 51% of whom lived in the cities. The oblasts later administered by the RK Ukraine were populated by 18.25 mil-

⁸⁹ Centralnoye Statisticheskoye Upravleniye pri Sovete Ministrov SSSR. *Itogni Vsesojuznoy Perepishi Nazeleniya 1959goda: Ukrainskaya SSR*, Moscow, 1963, p. 12-17.

lion inhabitants, of whom only 27% were urban. The Rumanian-administered oblast Odessa contained 2.07 million people in 1939 (0.78 million in the cities). This means the area encompassed later by the RK Ukraine included only 60% of the 31 million inhabitants of the old SSR Ukraine. In the case of the urban population it was even less, namely 43%! The industrial part of the “old” SSR Ukraine obviously remained outside the RK Ukraine. Inasmuch as the Soviet evacuation efforts were concentrated on the urban population, it is to be expected that the share of evacuees in the RK Ukraine should have been below the general average of around 30%.

Of the 16.91 million people of the RK Ukraine, several millions lived in the former Polish provinces Polesia and Wolhynia as well as the former Soviet SSR White Russia. Fortunately, the German statistics on the RK Ukraine were detailed enough that it was possible to determine the population within those areas: In former Polish Polesia and Wolhynia there were 2.78 million, and in the part of the former Soviet SSR White Russia 0.48 million. Deducting both numbers from the 16.91 million of the total RK Ukraine, we obtain 13.65 million people in the “old” Soviet areas of the German-occupied RK Ukraine. Before the war, this area had a population of 18.25 million;⁹⁰ hence, one-quarter of the total population had disappeared.

Before the war, the greater portion of the Ukrainian urban population, however, was concentrated in the eastern Ukraine, which remained under German military rule. Since the Soviets concentrated their evacuation efforts on the cities, and because the share of the urban population was over 50% in the eastern Ukraine, it is certain that the portion of the population evacuated there was comparably larger than in the western Ukraine. Quite probably, almost every third inhabitant of the Ukraine had been deported or evacuated by the Soviets before the Germans occupied that region.

The degree of urbanization in the Soviet Union increased from west to east, and Soviet evacuation measures concentrated above all on the urban population important to the armaments industry. Thus, as the German-Soviet battlefront moved eastward, an ever larger share of the population had been removed by the Soviets, despite the fact that the urban evacuation ratio tended to decrease at the same time. As a result, while westernmost areas lost “only” one-sixth of their total population, the western “old” Ukraine suffered a loss of one-fourth, and the highly industrialized Donets basin and eastern Ukraine may even have registered a population decline of up to 40%.

⁹⁰ The figure of 18.25 million contains the oblast Vinnitsa with a population of 2.28 million. In part, this oblast stretched onto the area west of the Bug, which came under Rumanian administration during World War Two (northern Transnistria). It is possible that up to one third of the population of the oblast Vinnitsa should be allocated to Rumanian Transnistria and not to the RK Ukraine. On the other hand, we should also take account of the natural increase of 4-5% for the 2½ years until mid-1941. Both corrections amount to about 750,000 persons and offset each other.

FOURTH CHAPTER:

The Jewish Fate in the Soviet Union: 1941-1945

Soviet Jews in the German Sphere of Influence

The Jewish population was accorded a very special attention within the framework of the Soviet clearing measures. The Zionist Institute of Jewish Affairs (Institute) wrote for instance:¹

In numerous cities and towns, particularly in the Ukraine and White Russia, Jews were among the first to be evacuated.

The reason for this preferential treatment was seen by the Institute to be connected with the high percentage of Jews in the Soviet administration, among the office and blue-collar workers and the intelligentsia; it added:

For this reason, despite the Army's urgent need for transportation, thousands of trains were provided for evacuation. Thus, not only were hundreds of thousands of human lives saved, but military highways were quickly cleared of millions of refugees.

The Institute emphasized that there was no shortage of time to remove the civilian population, especially in the larger cities such as Kiev, Odessa, Smolensk, etc.:²

... there was time enough to evacuate the civilian population.

The technical prerequisites had been met, and the same means of transportation which brought the masses of the Red Army to the western front were used on their return trip for the evacuation and the deportation of the civilian population. Also, one must assume that the Soviets, following their own example of the spring of 1940 when they had deported the Polish-Jewish refugees from eastern Poland to Siberia, were not overly concerned with the comfort of the population scheduled to be removed.

Shitomir, which contained 50,000 Jews before the war, was presented by the Institute as an example of the relatively high percentage of Jews evacuated. Of these, 44,000 (88%) left with the Soviet troops; considering

¹ Institute of Jewish Affairs, *Hitler's Ten-Year War*, p. 186.

² *Ibid.*, p. 186.

that 53,000 of the 95,000 inhabitants (minimum) of Shitomir had been evacuated, the Jewish share amounted to four-fifths of all evacuees!³

Minsk, too, confirms Zionist reports of a preferential treatment accorded the Jews by the Soviets in the evacuation program. After the occupation of Minsk within the first few days of the war, General Halder found no more than 100,000 of the former population of 240,000 (1939); the rest had fled, been evacuated or deported.⁴ Kube, the German Reich Commissar for White Russia, stated that all but a few thousand of the Jews of Minsk had gone with the Red Army.⁵ Before the war, there were approximately 90,000 Jews in Minsk.⁶ Assuming that the words "few thousand" referred to a figure of 5,000, we obtain the following picture. About 60% of all evacuees (85,000 of 140,000) were Jews, even though they constituted only 38% of the population; the Jewish population was removed almost in its entirety, in the case of the non-Jewish population it was just over one-third.

A Soviet Union specialist, Joshua Rothenberg of the Brandeis University, put it bluntly:⁷

Much of the Jewish population of the conquered territories escaped annihilation by fleeing before the invading armies arrived.

The *Judaica* says that most of the 7,000 Jews of Lepaya (a few miles from the German border) escaped, *before* German troops occupied the city six days after hostilities began. In Lithuania, too, which was liberated from the Soviet yoke within a week, a considerable number of Jews escaped to the interior of the Soviet Union, even while the German invasion was in progress.⁸

Baranowicze, a town with a very large Jewish population, was populated by just 10% of its former population, even though occupation by German troops occurred within days after they crossed the border.⁹ Of Vitebsk's 100,000 Jews, only 22,000 remained behind according to a report by the Soviet Jewish author David Bergelson of the Jewish Anti-Fascist Committee in the Moscow newspaper *Eyntykeyt* dated 9/5/1942.¹⁰ Reitlinger, who estimated the number of Jews in Soviet White Russia (borders

³ *Ibid.*, p. 186; the census of January 1939 found a total population of 95,090 in Shitomir. Until mid-1941 the city must have grown by at least another 10,000. Since the German administration found only 42,000, at least 63,000 inhabitants must have been deported; of these, 44,000 were Jews. Thus the Jewish share among the evacuees probably was closer to 70% than 80%.

¹⁰ Aronson, *Soviet Russia and the Jews*, p. 19.

of 1941) at 861,000, said the Germans found no more than 172,000 of them.¹¹

Kishinev in Bessarabia was occupied by the Axis on July 17, 1941. The Rumanian count of August 16, 1941, however, found only 201 Jews of the former 70,000 living there before the war.¹² The non-Jewish population apparently suffered a loss of roughly 15,000 because of deportations; this is equivalent to a rate of “only” 20-25%. Of the approximately 200,000 Bessarabian Jews, the Soviets had removed all but 6,882; fewer than 5% could be traced by the census.¹³

The situation was very similar in the Ukrainian town of Novograd Volynsk, which also was located very close to the border and contained a very large Jewish population. Only 10% of the town’s inhabitants remained behind when the Germans occupied it three days after war broke out. As for Kiev, the Institute said:¹⁴

In Kiev, practically the entire Jewish youth left the city together with the Soviet Army. Only elderly people remained behind.

The Zionist sources are unanimous that the evacuation or deportation of the Baltic Jews and the native population was started some time *before* the war began. The Institute dates the initiation of mass arrests and deportations in Lithuania at *ten days before* hostilities started.¹⁵ The *Judaica* declared that

*the phase before the German attack on Lithuania was marked by deportations to Siberia. [...] In mid-June 1941, one week before the German-Soviet war, many people, including Jews, were hastily reported as politically unreliable [...]*¹⁶

And the *Year Book* complained:¹⁷

The evacuation of Baltic Jews was not started until a week before the actual invasion.

German investigations after the conquest of the Baltic countries confirm these reports. It was found that the Soviets had initiated sudden arrests, deportations and murders in the night from June 13 to 14, 1941. These atrocities continued until the liberation of these countries by the German army.¹⁸

Thus, if in a larger town like Dnepropetrovsk only 20,000 of the former 100,000 Jews remained behind¹⁹ – German reports, however, mention less

¹⁹ *Encyclopaedia Judaica*, Vol. 6, p. 141.

than 1,000²⁰ – then this is not very surprising in view of the Soviet preparations for a mass removal in case of war and the available time interval until German troops reached the larger cities. Melitopol and Mariupol, two large cities on the Sea of Azov where only a quarter of the total population was missing because German troops had taken these cities in a surprise action, are just the exception to the rule; still, in the first city only 18% of the Jewish population was present, and in the second it had disappeared completely.²¹

However, it is truly remarkable that the towns which were located far to the west and which contained often very large Jewish populations had been almost completely denuded of their Jewish inhabitants by the time the German troops took control of them. This was only possible because – as Zionist sources confirm – the evacuation program had been put into action long *before* the war began and because the Soviet clearing measures even allowed for a removal of the population as the German invasion was in progress.

The large degree of urbanization and concentration of the Jewish population certainly aided this effort. In the “old” Ukraine, 39% of the Jews lived in just four cities – Kiev, Odessa, Kharkov and Dnepropetrovsk – none of which were occupied or cut off until 7½ weeks after June 22, 1941.²² In total, 85.5% of the Ukrainian Jews lived in the cities in 1939; in White Russia it was 87.8%.

This advantage was reinforced by the circumstance that the population group upon which the Soviets put the greatest emphasis in their evacuation efforts consisted of government officials, party functionaries, specialists and office workers; in this group the Jewish share was far in excess of their numerical size.²³

No wonder that David Bergelson was able to declare at the end of 1942 (!) that 80% of the Jews in the conquered areas had been evacuated. He continued in the Moscow newspaper *Eynikeyt* of December 5, 1942 – 1½ years after the war started:²⁴

The evacuation saved a decisive majority of Jews of the Ukraine, White Russia, Lithuania, and Latvia. According to information coming from Vitebsk, Riga and other large centers which have been captured by the Fascists, there were few Jews there when the Germans arrived. [...] This means that a majority of the Jews of these cities was evacuated in time by the Soviet government.

The Soviet poet Itzik Feffer declared formally in New York during the war that the Red Army “saved a few million Jews!” On March 15, 1943(!),

²⁰ *Deutsche Ukraine-Zeitung*, 2/61 1942, p. 3, reported that the population count found only 702 Jews.

²¹ Hilberg, Raul. *The Destruction of the European Jews*, New York, 1973, p. 192.

²² *Encyclopaedia Judaica*, Vol. 15, p. 1515.

²³ Institute of Jewish Affairs, *Hitler's Ten-Year War*, p. 185.

²⁴ Aronson, *Soviet Russia and the Jews*, p. 18.

Eynikeyt reported D. Zaslavsky telling a plenary session of the Soviet-sponsored Jewish Anti-Fascist Committee:²⁵

The Red Army saved the Jewish people at the most critical hour of its history.

Also, the fact that in many cities for which Jewish evacuation ratios were ascertained – e.g. Baranowicze, Lepaya, Novograd Volynsk, Minsk, Kishinev – much more than 80% of the Jewish population was gone, even though these cities were occupied by German forces within days after hostilities began, points toward an almost total evacuation by the Soviet authorities.

In this connection, we should refer back to the findings in the Third Chapter which show that the evacuation ratios of the Baltic cities were far below those of the Slavic Cities. It is truly astonishing how close the relationship is between the evacuation ratios of the urban population and the relative size of the Jewish population in those cities. On Chart 2 we recorded the Jewish population share of individual Soviet cities – to the extent available. Quite obviously, in the center area of the war theater where the evacuation ratios were very high (see *Chart 1*), the Jewish share of the urban population also was very large.

The Evacuation of Wolhynia

The General District Wolhynia-Podolia in the RK Ukraine encompassed not only the “old” Soviet areas in Podolia, but also the former Polish province of Wolhynia and the largest part of former Polesia. The northern sections of Polesia had been incorporated in the RK Ostland. Thus, the only area for which we can obtain relatively exact population figures for the periods *before* and *after* the German occupation is Wolhynia.

The territory of the former Polish province of Wolhynia included in the General District of Wolhynia-Podolia covered the areas of Dubno, Gorochov, Kostopol, Kovel, Lutsk, Kremianets, Lubomil, Rovno, Sarny and Vladimir Volynsk.²⁶ In this region the Polish census of 1931 registered a total population of 2,085,574, including 207,792 Jews.²⁷

For years the birth rate of the non-Jewish population was around 2.7%, or even slightly more, while that of the Jewish population was only 1.8% in

²⁵ *Ibid.*, p. 18.

²⁶ *Zentralblatt des Reichskommissars für die Ukraine*, Rovno, No. 2, 2nd Year, 1/9/1943, p. 8-20, Bundesarchiv Koblenz: R 43 II/690c.

²⁷ *Drugi Powszechny Spis Ludności Z Dn. 9.XII 1931 R.*; Województwo Wołyńskie: Mieszkania i Gospodarstwa Domowe. Ludność. Stosunki Zawodowe;; Główny Urząd Statystyczny Rzeczypospolitej Polskiej, *Statystyka Polski*, Seria C, Zeszyt 70 (*Deuxième Recensement Général de la Population du 9 Décembre 1931*; Voievodie de Wolyn: Logements et Ménages, Population, Profession), Warsaw, 1938, Table 13.

1931 – a drop by 33% since the early 1920s. Applying a mortality rate of 1.2%, the surplus of births over deaths must have registered 1.5% in the case of the non-Jewish and 0.6% in the case of the Jewish population. It may be assumed that this positive growth rate was reduced in the course of the economic crisis of the 1930s, especially as far as the Jews are concerned. For the period after 1932 one should, therefore, apply natural population changes of 1.4% and 0.5%, respectively.

In the First Chapter we referred already to the enormous emigration of young male Jews in the inter-war period. For the years 1932-1939, we also calculated a Jewish emigration loss of 15%. To be sure, there is no reliable information as to whether or not this emigration was as high among the eastern Polish Jews, but the even more unfavorable male/female ratio of 86/100 (after adjusting for men in military service) of the age group “15 to 29 years” in Wolhynia indicates that emigration among the eastern Polish Jews was possibly even higher than that of all Polish Jews, certainly not lower.

Table 8 provides details on Wolhynia’s total population as recorded by the Polish census of 1931, as well as adjustments for population growth and Jewish emigration thereafter. Furthermore, both population groups have been classified by age in order to show that age group separately which later became subject to Soviet military draft calls. On this basis, one should have expected to find 2,374,663 inhabitants in Wolhynia in 1942 under “normal” circumstances, including 186,585 Jews and 585,134 males (Jewish and non-Jewish) of the years of birth 1897-1926.

The German count, however, found only 1,984,406 inhabitants as of January 1, 1943;²⁸ more than 16%, or 390,257, were missing. But since this figure included those former Red Army men who had been released from prisoner-of-war camps in the meantime, the actual number of missing people right after the occupation must have been somewhat larger yet. The question is which nationalities and which age groups accounted for the bulk of these 390,257 missing persons.

If it were true that the Soviets were unable to evacuate the civilian population because of the rapid German advance, all or most of the 390,257 missing should be allocated to the young men of the years 1897-1926 subject to the Soviet draft. In this case, of the 585,134 in this age group only about 200,000 remained behind; the majority would have gone with the retreating Soviets. Applied to all male age groups, the Soviets would have taken one-third of the entire male population with them, and the male share of the population would have fallen from 49% to 39%.

²⁸ *Zentralblatt*, 1/9/1943, p. 8-11.

*Table 8: Development of the Wolhynian Population:
1931 until the German Occupation*

Year of Birth	Total Population			Non-Jews		Jews	
	Total	Male	Female	Male	Female	Male	Female
A) According to Polish Census of December 9. 1931:							
Years 1897-1926	1,217,412	595,630	621,782	539,427	559,007	56,203	62,775

Source: *Drugi Powszechny Spis Ludności Z Dn. 9.XII 1931 R.*; Mieszkania I Gospodarstwa Domowe. Ludność. Stosunki Zawodowe; Województwo Wołyńskie; Główny Urząd Statystyczny Rzeczypospolitej Polskiej, Statystyka Polski, Seria C, Zeszyt 70 (*Deuxième Recensement Général de la Population du 9 Décembre 1931*; Logements et Ménages, Population, Profession), Warsaw, 1938.

This interpretation contradicts the fact that, even though German reports tell of huge losses among the male population of the occupied territories, no deportation of this magnitude among the economically most active population part has ever been mentioned. Fortunately, German population counts in the Baltic countries which, like eastern Poland, were incorporated into the Soviet empire just prior to the war gave separate figures for the two sexes; the statistics indicate that thousands of families were deported by the Soviets before the Germans arrived, but that the majority of the evacuees were male. And still, the male share of the total Baltic population had shrunk to only just over 46%,²⁹ even though large parts of the Baltic countries, especially Estonia, were conquered as late as eight weeks after the occupation of Wolhynia.

The Soviets deported especially the urban minorities – by family – which belonged to the pillars of an industrial society; in Wolhynia, this was true particularly of the Jews. The enormous evacuation ratios of the former eastern Polish cities – e.g. Brest Litovsk, Vladimir Volynsk, Kovel, Baranowicze, Lutsk, Rovno, Sdolbunov and Pinsk, all of which registered rates of between 25 and 90% (see *Table 6*) and may have averaged 50%, if we allow for an increase in the urban population since 1931 – prove that

²⁹ *Bevölkerung in den besetzten Ostgebieten*, 2/17/1943, Militärarchiv Freiburg, Bestand RW 31/260.

the roughly 400,000 missing persons in Wolhynia were *not* to be found predominantly among the male age groups subject to the Soviet draft.

Everything seems to indicate that the above mentioned evacuation ratios for the eastern Polish cities were quite typical. If we assume that the urban population of this region had increased by 50,000 since 1931 and if we add the population of the Jewish “shtetls” as well, we obtain a total urban population of roughly 400,000 for the former Polish province for mid-1941; of these, 200,000 were deported by the Soviets.

The gender composition of Wolhynia’s population probably was similar to what we found in the Baltic countries after the German occupation; there, the male/female ratio was 46/54. Consequently, Wolhynia’s remaining population before and after the German occupation looks as follows:

	Total (%)	Male (%)	Female (%)
Before occupation	2,374,663 (100)	1,166,311 (49)	1,208,352 (51)
After occupation	1,984,406 (100)	912,827 (46)	1,071,579 (54)
Missing persons	390,257 (100)	253,484 (65)	136,773 (35)

Now, the question is, how these missing persons should be divided between the Jews and the non-Jews. Between 1931 and WWII, urbanization proceeded in eastern Poland as almost everywhere else, and then there was the emigration of large numbers of Jews. Thus, the Jewish population constituted roughly 50% of the Wolhynian urban population in 1931, but just before WWII this was hardly the case; by then, their share must have been less than that. On the other hand, it is a fact that the Jews were much more affected by the Soviet evacuation program than other population segments.

The large number of women among the missing persons (35%) points to the evacuation of tens of thousands of families. The population group in this category probably consisted of artisans, doctors, specialists, the intelligentsia, office workers, etc., among all of whom the Jews may have had an absolute majority. Also, the willingness to be evacuated probably was much greater among the Jewish families than among the Polish and Ukrainian.

In view of the almost grotesque relationship between evacuated Jews and non-Jews in Soviet cities – e.g. Minsk, Shitomir, Lepaya, Dnepropetrovsk – and the political unreliability of the Polish and Ukrainian population segments in Wolhynia, it would indeed have been very surprising, if less than 60% of the evacuated female civilians would have belonged to the Jewish group, particularly as almost half the urban population was Jewish. Applying a matching male share corresponding to the composition of the pre-war Jewish and non-Jewish populations, and finally subtracting the evacuated family members (as calculated) from the total number of missing persons, one obtains 125,243 young men subject to the draft; these

males probably were drafted directly from the countryside into the Red Army. In table-form it looks as follows:

Total population before the Ger- man occupation	of which: Missing (%) persons	Male	Female	Population group
2,374,663	390,257 (16)	253,484	136,773	(Missing females: 60% Jewish, 40% non-Jewish)
186,585	157,265 (84)	75,201	82,064	Jewish civilians
2,188,078	232,992 (11)	53,040	54,709	non-Jew. civil.
		125,243		Men subject to draft

(The computed figure of 125,243 “drafted” individuals, of course, is much too low since some of the male “civilians” certainly were also drafted into the Red Army).

Thus, it seems that more than 80% of Wolhynia’s Jewish population was removed by the Soviets. Considering that the vast majority of the Jewish population of many Soviet cities conquered by German troops during the first ten days of the war had been removed by the Soviets, the computed ratio of 84% evacuated Jews in Wolhynia is quite realistic. To be sure, compared to the “old” Soviet cities which registered Jewish evacuation ratios of over 80% (*Table 9*), the Soviet evacuation of the Jewish population of these Wolhynian cities close to the German frontier is quite impressive, but not surprising (see *Chart 1*).

Before the war, 2.03 million Jews lived in the “old” Soviet areas occupied by the Axis troops (Second Chapter). More than half of them were concentrated in the cities listed on *Table 9*, and fewer than one-fifth fell into German hands. Reitlinger put it like this:³⁰

Not only did the bulk of the three million Jews of pre-war Soviet Russia escape into the interior, but also a very large proportion of the 1,800,000 Jews of the annexed territories. [...] in the historic towns of the pre-industrial Russian Ukraine, Vinnitsa, Zhitomir, Berdichev, Uman, Nikolaev, and Kherson, only a quarter or a fifth of the Jews stayed on, and this was equally true of the enormous Jewish agglomerations to the East, the towns along the Dnieper, Kiev, Kharkov, and Dniepropetrowsk. Further East still, in the Donetz and Kuban basins and North of the Caucasus, only a small percentage of the Jews awaited the Germans.

The picture unfolding here is one where Wolhynia fits perfectly into the overall clearing and evacuation program of the Soviet leadership. No matter whether we turn to the Baltic countries, former eastern Poland, White Russia or the Ukraine, the bulk of the Jewish population of all of these Soviet areas had been removed either before hostilities started or withdrew together with the retreating Red Army to the east on a more or less voluntary basis. Reitlinger’s admission certainly is not subject to suspicion and

³⁰ Reitlinger, *Final Solution*, p. 227-228.

matches the evacuation ratios for the Jewish population of the “old” Soviet cities as listed on *Table 9*.

The fact that the main area of settlement of the urbanized Soviet Jews was still concentrated in the western Soviet Union at the beginning of the war did not hinder the Soviet efforts to remove the Jewish population to the east. Quite the opposite is the case; because urbanization was much lower in the west than in the east, and the bulk of industry was to be found in the eastern Ukraine, the Soviets were in a position to devote a greater proportion of their efforts to the evacuation of the urban population of the western territories than was possible in the industrial east.

Table 9: Soviet Evacuation of the Jewish Population of “Old” Soviet Cities

Cities	Jewish Population		Evacuation in percent
	b e f o r e Evacuation	a f t e r Evacuation	
Minsk ^{5/6}	90,000	5,000 (est.)	94

³¹ *Ibid.*, p. 241.
³² *Ibid.*, p. 237.
³³ See *Table 6*. Reitlinger, however, arrived at only 175,000.
³⁴ Reitlinger, *Final Solution*, p. 240: He says that two-thirds of the Odessan Jews left by train for the eastern Soviet Union before the city was encircled by Rumanian troops on 8/13/1941. It was not captured by German and Rumanian troops until 10/16/1941. In the meantime, the Soviets deployed their Black Sea Fleet to deport tens of thousands of civilians, including many Jews.
³⁵ *Encyclopaedia Judaica*, Vol. 10, p. 1049.
³⁶ Reitlinger, *Final Solution*, p. 227, writes that the number of those remaining behind in Vinnitsa, Kiev, Uman und Berdichev was about one-fourth or one-fifth.
³⁷ *Encyclopaedia Judaica*, Vol. 10, p. 994.

Sources and Notes (*Table 9*)

- (a) Reitlinger³² said the last Jewish census figures for Kharkov pertain to 1926 (81,139); until 1939, Kharkov's total population more than doubled to 833,400, but it is unlikely that the city's Jewish population doubled, too. On the other hand, the *Judaica*²¹ notes that Kharkov, Kiev, Odessa and Dnepropetrovsk contained 39% of the Ukraine's Jewish population in 1939. This means that 585,000 of the 1.5 million Ukrainian Jews were accounted for by these four cities; the Jewish population of the last three towns added up to 455,000. Consequently, 130,000 remain for Kharkov.
- (b) For these cities no more recent population data for Soviet Jews are available. The listed Jewish population figures pertain to the year 1926, and in the case of Taganrog, Mariupol, Vinnitsa, Chernigov and Kirovograd they have been taken from *Table 6*; for Uman and Berdichev Hilberg's³⁸ Jewish population figures refer to 1920 and 1923, respectively. It is all but certain that the Jewish population of these cities was considerably higher in the year 1939 than in 1920, 1923 or in the census year 1926, because the census of 1926 tended to underestimate the Jewish population and because many Jews had moved from the smaller country towns into the larger cities in the course of the enforced Soviet industrialization program.
- (c) The stated evacuation rate of 79-83% is almost certainly too low for the following reasons: (i) for some cities the higher 1939-population figures were not available, and the utilized 1926-figures are known to be too low; (ii) Reitlinger writes in the case of Odessa that two-thirds of that city's Jews had been removed by train.³⁹ Odessa was encircled on August 13, 1941, by the Rumanians and taken on October 16. In the meantime, the Soviets evacuated tens of thousands of Red Army men and civilians, 86,000 soldiers and 15,000 civilians just in the period from October 1 to 10. The number of civilians evacuated in August and September is not known to the author, nor is the percentage of Jews among them. In view of the obvious preference for the Jews in the evacuation of other cities, their share must have been large. For these reasons one should assume that the number of Jews who fell into Rumanian hands must have been less than 50,000.

Some Remained Behind

Reitlinger's data are rather informative when attempting to pin down the number of those Jews who remained behind to face German occupation. Providing many examples, including evacuation ratios, he wrote that the "bulk" of the Jews of pre-war Russia escaped. Since one-third of the Jews found in the Soviet census of 1939 lived outside those areas later to be conquered by Germany, only a small number of the remaining Jews – in absolute and relative terms – of the pre-war Soviet Union can possibly have fallen into German hands. In addition, "a very large proportion," as he puts it, of the 1,800,000 Jews of the annexed areas escaped German control. The conclusion thus is compelling that Reitlinger himself believes the number of Jews who remained behind to be less than a million. Actually, this puts Reitlinger in direct opposition to the usual post-war literature on Soviet Jews.

In early 1941, 3,597,000 Jews lived in the Soviet areas occupied by Axis troops in the course of WWII (see Second Chapter). If only 80% of this

³⁸ Hilberg, *Destruction of the European Jews*, p. 190.

³⁹ Reitlinger, *Final Solution*, p. 240.

number were evacuated during the war, this would be equivalent to 2,877,000. Subtracted from the 3.6 million, one obtains a mere 720,000 as the number of Soviet Jews remaining under German administration. In this connection, a report by the Canadian-Jewish journalist Arthur Raymond Davies is rather interesting, who spent the war years in the Soviet Union as a correspondent and published his impressions and experiences after the war in New York. Besides his words of praise for the valor of the Jewish Red Army men and partisans, he mentioned a plenary session of the Jewish Anti-Fascist Committee in the autumn of 1944 (!), on the occasion of which its secretary Shachne Epstein reported the evacuation of 3.5 million Jews from the territories occupied by Germany.⁴⁰ Epstein's figure of 3.5 million evacuees – which apparently also included the three-quarters of a million Jewish refugees from Poland deported to Siberia in the spring of 1940 – matches our own computations on the number of Jews removed by the Soviets until 1941 and 1942 very well.

We should also remind ourselves that most of these 720,000 Jews in German-occupied Soviet territory belonged to the older age groups, because the Soviets had little interest in the evacuation of additional eaters, and also, as one witness before the investigating committee of the U.S. House of Representatives put it, because “the older people who knew the Germans from World War I, they thought that the Germans are not so bad and that they can live better with Germans than the Soviets.”⁴¹ The natural mortality rate of a population group consisting mainly of older people is of course far higher than for a normal age structure. This should not be forgotten when considering those events, particularly because in this case births were practically non-existent.

Certainly, a large number of these roughly 700,000 remaining Soviet Jews did not survive the war. The age structure itself must have effected a considerable negative natural change. The extremely hard, often fanatical battles between German and Soviet troops happened to take place to a large extent in and around the cities; since almost 90% of the Jews were city dwellers, it is quite probable that the remaining older Jews suffered proportionately greater civilian losses. In addition, there were many pogroms against the Jews initiated by the *local* populations the Baltic countries, White Russia and in the Ukraine after the Soviet troops had pulled back. Only the decisive action taken by German and allied troops put a stop to these murderous activities.⁴² Shootings of Jewish hostages in retali-

⁴⁰ Davies, Arthur Raymond. *Odyssey through Hell*, New York, 1946, p. 142.

⁴¹ *Treatment of Jews by the Soviet*, 1954, p. 40.

⁴² Burg, J.G. *Schuld und Schicksal: Europas Juden zwischen Henkern und Heuchlern*, Munich, 1965, p. 50.

ation for the murder of German soldiers by the partisans,⁴³ among whom the Jews were very active according to their own accounts – Soviet statistics mention more than 500,000 German soldiers murdered by partisans⁴⁴ – were not at all unusual.

To what extent the taking of hostages among the Jewish population was practiced in the sense of a systematic annihilation program is not our subject. All one needs to do is to check the pertinent literature of the post-war period in order to appreciate the extraordinary role Jews played during the war as partisans against the German Wehrmacht. Even Dr. M.W. Kempner⁴⁵ does not question the taking of hostages as “in accordance with international law.” He writes:⁴⁶

Hostages are taken in periods of occupation, in order to keep the population of the occupied territories from committing crimes against the occupation forces.

Lastly, hunger, cold, epidemics and lacking medical attention among the mainly elderly remaining Jews probably caused many losses.

The Zionist Gregor Aronson mentioned that the Soviet Jew Lev K. Zinger reported in his book *Dos Oifgekumene Folk* (Moscow, 1949) that tens of thousands of Jews could be found in early 1946 in the various smaller and larger towns of the Ukraine, White Russia, Moldavia, Latvia and Lithuania. He cited the following cities:⁴⁷

Kharkov	30,000
Dnepropetrovsk	50,000
Odessa	80,000
Mohilew-Podolsk	3,000
Novograd Volynsk	3,000
Malin	1,000
Czernowitz	70,000

Reitlinger, who based his figures on the Moscow newspaper *Eynikeyt*, mentioned the same figures for Odessa and Dnepropetrovsk and added:

⁴³ Most of the Jewish publications mention with pride a strong Jewish participation in partisan activities during the last war; examples may be found in almost all volumes of the *Encyclopaedia Judaica*.

⁴⁴ Telpuchowski, *Die sowjetische Geschichte*, p. 284, asserts that White Russian partisans alone murdered about 500,000 German soldiers and officers and 47 generals.

⁴⁵ *WER IST WER?* (Walter Habel, ed.), Frankfurt, 1975, describes this gentleman, inter alia, as follows: “after the war dept.head of chief prosecutor (Jackson) at Intern. Mil. Tribunal Nuremberg, asst. prosec. against Reichs-Min. of Interior Frick, beg. 1947 American dep. chief prosec. Wilhelmstr. Trial against cabinet members and diplomats of the III. Reich.” The American professor A.R. Butz, *The Hoax of the Twentieth Century*, Los Angeles, however, arrived at vastly different conclusions in 1977; see in particular pages 29, 160-161, 163-169, 194, 195, and 244.

⁴⁶ Kempner, Dr. Robert M.W. “Briefe an den Herausgeber,” *Frankfurter Allgemeine Zeitung*, Frankfurt am Main, No. 23, 1/28/1981, p. 9.

⁴⁷ Aronson, *Soviet Russia and the Jews*, p. 23.

Kiev	100,000
Vinnitsa	14,000
Shitomir	6,000

He remarked, furthermore, “these figures were recorded at a time when the homeward trek from the deep interior had only begun.”⁴⁸ It is also interesting that Shitomir’s population size of 1946 equaled exactly that of the Jews who remained behind to face German occupation in 1941.⁴⁹

In other words, these listed cities, which contained a total of about 360,000 Jews in the former German-occupied parts of the Soviet Union, represent largely the Jews who survived the war *and* the German occupation. Also, a homeward trek must be understood to mean that these people had been evacuated previously; here, too, Reitlinger contradicts the current literature, according to which the rapid German advance prevented the Jews to escape in appreciable numbers.

Nobody knows the number of Jews who survived in the western parts of the Soviet Union at the time the Red Army proceeded to reoccupy that territory. But this extract of only ten cities with a population of 360,000 Jews (in early 1946!), as well as the fact that other Soviet republics – *e.g.* Moldavia, Lithuania and Latvia, which Zinger mentioned by name without providing figures – also were inhabited by thousands of survivors, show that the vast majority of the three-quarters of a million Soviet Jews under German administration survived the war.

The extent of the losses suffered by the Soviet Jews who remained under German control is debatable. It seems that because of their age structure – elderly people predominated – the natural excess of deaths must have reached at least 3% per year;⁵⁰ in three occupation years, this adds up to a reduction of 65,000. This means that the Jewish population under German control – the figure of 720,000 probably is too high – was reduced to 655,000. Other losses could have occurred on account of the general negative environment as described above, and because of the Jewish participation in partisan activities in violation of international law. All of this makes a further reduction by roughly 10%, or 65,000, to about 590,000 possible. Thus, it would seem that, if 360,000 Jews were found in just ten cities in former German-occupied territories in early 1946 and many other

⁴⁸ Reitlinger, *Final Solution*, p. 500.

⁴⁹ Compare Institute of Jewish Affairs, *Hitler’s Ten-Year War*, p. 186.

⁵⁰ The Jewish mortality rate in the Soviet Union must have been greater than 1.2%. Since natural deaths occur primarily in the age groups 50 years and over, and these age groups accounted for roughly 30% of the population, it may be presumed that at least 3.5% of the population over 49 years of age died annually of natural causes. We based our calculations on a rate of 3%, because the exact composition of the remaining Jews is not known, but the older age groups nevertheless constituted the vast majority.

thousands survived in other, not specified Soviet cities, our figure of 590,000 surviving Jews after the German retreat seems realistic.

Death in Siberia

Fate was much worse for the Jews living under Soviet domination during the war. Among the 750,000 Polish-Jewish refugees, 150-250,000 died from hardships on the way to the east and the north. Those who arrived in Asia were put into labor and concentration camps. As mentioned already, among these unfortunates was also Menachem Begin, the subsequent Jewish IRGUN-terrorist in Palestine and recent recipient of the Nobel Peace Prize.

Even the *Universal*, which was quite sympathetic to the Soviet cause in 1943, spoke of "Siberia, where they underwent great hardships."⁵¹ The Joint Distribution Committee, which aided the Jewish victims in Siberia and the Russian North during the war with food and medicine, was a little more outspoken. In its Bulletin of June 1943 it informed us that the survivors of the deportations had to put up with further privation.⁵²

The [Soviet] government gives each refugee from a half to one pound of bread each day. [...] Food can only be bought with things. Money has lost its value.

Apart from the monotony of this kind of food supply, those tortured people received less than a third of the calories needed for survival – a fatal deficiency in the inhumane environment of Siberian labor and concentration camps. The Jewish author Reitlinger commented:⁵³

In Southern Siberia, the death-rate was very high for [...] Jews [...]

The small number of 157,500 Polish-Jewish refugees returning from Siberia to Poland in 1945/1946 gives us an idea of the terrible fate Jewish deportees from Poland met in Siberia. 600,000 have *disappeared*. Even if one includes those few who unimaginably preferred to remain in the Soviet Union, the total of the Jewish victims of Soviet labor camps hardly would be affected. The argument that the Soviets forced most of them to stay there after the war does not hold up. The 157,500 returnees left Poland soon after their arrival from Russia to move on to the West. They would have known if a considerable number of their compatriots had been kept in Soviet Russia against their will. But there are no indications of this to be found in post-war literature. Everything seems to point to the horrible fact that 600,000 Polish- Jewish refugees died in and on the way to Siberia.⁵⁴

⁵¹ *Universal Jewish Encyclopedia*, Vol. 9, p. 681.

⁵² Aronson, *Soviet Russia and the Jews*, p. 12.

⁵³ Reitlinger, *Final Solution*, p. 499. .

⁵⁴ Understandably, there are no exact figures on the extent of this vast number of deaths. But the fact that post-war literature contains no hints to the effect that a considerable number of former

Another 2.9 million were evacuated to Siberia shortly before and after the start of the German-Soviet war. The fate of these people is unknown, but the sacrifice of the Jewish refugees from Poland is not a good omen. Certainly, in 1940 foreigners were deported after having refused the citizenship of the workers' and peasants' paradise, proving in this way that they were truly enemies of the glorious Soviet Union, whereas in 1941 the USSR's own citizens were moved to "safety." On the other hand, in 1941 the circumstances were such in many places that the Soviets had to introduce hasty measures; after all, their primary goal was to deny these trained people to the Germans and, in the second place, to save as many good workers for their own war effort. The transport of millions of people in a few weeks across a distant and rather primitive railroad network simply must have been costly in terms of human lives. These people, too, faced a life of hardship and misery in Siberia.

How badly those evacuated and deported Soviet citizens fared in Siberia in 1941/1945 may be gleaned from the words of the Soviet court historian Telpuchowski:⁵⁵

The provision of accommodations for the millions evacuated from the enemy-occupied territories to the areas of the hinterland posed a serious problem. [In re-constructing the transplanted factories the evacuated people] worked under the open sky, quite often in rain and snow. The most elementary lodging facilities were lacking; they had to live in tents and sod huts. Food was scarce. Work continued throughout the day. The workday often lasted from 12 to 14 hours and more.

No comments.

Referring to the mass deportation measures initiated in Lithuania one week *before* June 22, 1941, the *Judaica* says that the deported people were interned in forced labor camps and set to work in coal mines, wood cutting, and other heavy labor.⁵⁶ Without question, death must have reaped a terrible harvest under those conditions. After the liberation from the Soviet yoke, the shocked Baltic population told of unimaginable occurrences during the deportation and evacuation measures initiated on June 13/14, 1941. Thousands upon thousands of people simply were shot to death. If persons the Soviets were looking for could not be found, another family member or person living in the same house was taken in their place. The arrested peo-

Polish-Jewish refugees remained behind in the Soviet Union after the war, allows us to conclude that, except for those 157,500 returnees, almost all the others died in Siberia. The Jewish economist Jacob Lestschinsky (*AJYB*, Vol. 49, p. 397) puts the number of those who died in Siberia and central Asia at 500,000 Jews, while Gédéon Haganov (*Le Communisme et les "Juifs,"* Supplément de CONTACT, Paris, May 1951) arrived at about 450,000. The American Jewish Committee noted that only 200,000 had died in Siberia (*AJYB*, Vol. 49, p. 394).

⁵⁵ Telpuchowski, *Die sowjetische Geschichte*, p. 82 and 88.

⁵⁶ *Encyclopaedia Judaica*, Vol. 11, p. 385-386.

ple were crowded into cattle wagons in batches of 50 to 60, the men were separated from their wives, the children torn from their mothers. Doors and ventilation openings were nailed shut; there were no benches. The locked-up people were left to themselves, without food or drink. Many died on the way east. In a car left behind at the Oger railroad station, 60 suffocated children were found. These people were treated worse than cattle.⁵⁷

Some deportees managed to return to Estonia, Latvia and Lithuania; they told of terrible conditions in Soviet territory. People, they said, were being forced to work in the icy cold of the north and east with no other clothes and shoes than those they wore when they were arrested. Medical attention was lacking completely, and the persistent undernourishment caused people to die in huge numbers.⁵⁸

It is all but impossible to place a figure on the total number of Jewish victims in Siberia and the Urals. One should keep in mind that the evidence given by Western Zionist sources on the extent of Jewish losses in Siberia can hardly be called objective. The Soviets would never assume moral or financial responsibility. The temptation to keep that number as low as possible is obvious; after all, defeated Germany presented an easy scapegoat to be blamed for all of the Jews who were missing, killed in action or murdered by the Soviets.

The Hungarian Minister in Moscow, Prof. Szekfu, provided a vivid description of the shape in which the Jewish deportees and evacuees returned from Siberia; he said to Dr. Zoltan Klar from the Council of the Budapest Jewish Community:⁵⁹

[...] these people arrived from Siberia in Moscow in a desperate situation, sick and enfeebled, starved and bedraggled, in rags, without clothes or any other possessions.

If the condition of the Jews in Siberia was this terrible in 1946, what might the situation have looked like during the war? Obviously, putting the number of Jewish dead in Siberia at 700,000 probably is not enough to allow for all the victims of the barbarian Soviet policy.

But the war itself also created huge gaps in the Jewish population. From 1939 to 1942, 200,000 Jews fell in all Allied armies.⁶⁰ Deducting the Polish- Jewish soldiers killed in action and the unknown number of killed Jews in the British, French and U.S. forces – in the U.S. Army 550,000 Jews are said to have served during WWII – then it is quite possible that

⁵⁷ *Deutsche Zeitung im Ostland*, “30.000 Verschleppte nachgewiesen,” No. 5, 8/5/1941, p. 4, as well as “Die Schreckensnacht zum 14. Juni,” No. 12, 8/16/1941, p. 5; *Kauener Zeitung*, “Die Sonne Stalins über Litauen,” No. 6, 10/17/1941, p. 2, as well as “So fuhren sie in die Verbannung,” No. 140, 6/17/1942, p. 5.

⁵⁸ *Kauener Zeitung*, “Schicksale, die ganz Europa angehen,” No. 88, 4/14/1943, p.5.

⁵⁹ *Treatment of Jews by the Soviet*, 1954, p. 86.

⁶⁰ *Universal Jewish Encyclopedia*, Vol. 10, p. 23.

the Red Army suffered 100-150,000 Jewish soldiers killed in action during the first 1½ costly years of war against Germany. In any case, the *Judaica* maintained as late as 1971 that the Soviet-Jewish losses among the soldiers killed “in action” amounted to 200,000.⁶¹

The “loss” of 157,500 returned Polish-Jewish refugees after the war was compensated by the Soviets by chalking up “gains” among other European Jews. As will be shown in the Sixth Chapter, 65,500 Hungarian Jews disappeared in the Soviet Union. In addition, the Soviets annexed Ruthenia in 1945 with a Jewish population of probably less than 100,000.

Adding it all up, one obtains the following picture: Of the 5.3 million Jews under Soviet domination in 1939/1940, at least 700,000 lost their lives during the deportation to the east or in the Siberian “accommodations,” labor and concentration camps. 200,000 were killed in combat while serving in Red Army and partisan units, and a further 130,000 may have died because of the fighting in the cities, pogroms of the native population, hunger, epidemics, lack of medical attention, over-aging and, last but not least, because of German retributions against Jewish hostages in retaliation for Germans murdered by partisans. All of these developments may well have caused a loss of over one million. For this reason, one should not expect that more than 4.3 million Jews survived the war in the Soviet Union – a loss of 20% compared to early 1940. In table-form the development looks like this:

Under Soviet domination – 1939/1940		5,337,000
<i>deduct:</i>		
War and deportation losses		
– Jewish Red Army men killed in combat	200,000	
– Deportation and concentration camp losses in Siberia	700,000	
	<u>900,000</u>	
Losses in the German-Soviet theater of war	130,000	
Total losses		<u>–1,030,000</u>
Remaining		4,307,000
<i>Other changes:</i>		
Hungarian Jews retained in the USSR ⁶²	65,500	
Annexation of Ruthenia ⁶²	86,000	
	<u>151,500</u>	
Jewish refugees returned from the USSR	<u>–157,500</u>	<u>–6,000</u>
Jewish population in the USSR at the end of WWII (max.)		4,301,000

⁶² See Sixth Chapter.

FIFTH CHAPTER:

The Jews in the Post-War Soviet Union

The Survivors

Post-war literature usually puts the number of surviving Jews in the Soviet Union at about two million or even fewer. The *Year Book* arrived at 2,032,500,¹ and other Zionist sources mentioned figures as low as 1,500,000. They simply deny the established historical fact that the Soviets succeeded in evacuating the bulk of the Jewish population before and after the German “surprise” attack. If 600,000 Jews served in the Red Army,² then this must probably be explained by the Soviet evacuation of the male Jews of military age.

Age-specific data on the Jews living before the war in areas never occupied by Germany are not available as far as we know; for this reason, the age structure of the Polish Jews of 1931 was used. On this basis, males aged 16-45 years composed 22.7% of the total Soviet-Jewish population.³ Before the war, 1.6 million Jews lived in those parts of the Soviet Union never occupied by Germany (see Second Chapter). 22.7% of 1.6 million

¹ *AJYB*, 1948, Vol. 49, p. 740.

² *Ibid.*, 1942, Vol. 44, p. 234. Other Jewish sources provide somewhat lower figures for Jewish Red Army soldiers; Solomon Grayzel mentions only 500,000 Jews in the Red Army in his book *A History of the Jews* (Philadelphia, 1948, p. 766). Unfortunately, Grayzel does not indicate the source where his figure originated; the *AJYB* however refers expressly to Soviet reports. It is interesting that Grayzel also mentions 550,000 and 17,000 Jews, respectively, in the armed forces of the United States and Canada. Relative to the entire Jewish population in those two countries (for more details see the Seventh Chapter), this is equivalent to a rate of about 10%. The same applies to South Africa. In the case of Great Britain, 60,000 Jews are said to have served in Her Majesty's armed forces; this is an excellent indicator that the actual size of the Jewish population in England during the war was not 350,000, as Zionist sources maintain, but probably around 600-700,000. Since the Soviet Union had a somewhat larger Jewish population at the beginning of the war than the USA, and as the Soviets mobilized a relatively larger share of the male population, even the figures published in Moscow seem to be on the low side. But Grayzel's figure is lower yet, and thus even less likely.

³ *Drugi Powszechny Spis Ludności Z Dn. 9.XII 1931 R.*; “Polska: Mieszkania I Gospodarstwa Domowe. Ludność,” Główny Urząd Statystyczny Rzeczypospolitej Polskiej, Statystyka Polski, Seria C, Zeszyt 94A (*Deuxième Recensement Général de la Population du 9 Décembre 1931*; “Pologne: Logements et Ménages, Population,” Office Central de Statistique de la Polonaise, Statistique de la Pologne, Serie C, Fascicule 94A), Warsaw, 1938, Table 13.

amounts to 360,000 male Jews aged 16-45 years in 1941 in the “free” Soviet territories.

It is not likely that all Jews of military age were drafted into the armed forces. Deferments on account of the necessity to leave specialists in industry and administration, physical impairments, etc. hardly permitted more than 70%, *i.e.* 250,000, to be inducted. This means that 350,000 must have come from the occupied areas. Assuming the same deferment ratio for them, the Soviets must have evacuated 500,000 Jewish males of military age from the occupied territories.

On the basis of these calculations we arrived at 2.1 million. Deducting from it the 200,000 Jews killed in combat and adding the supposedly very few Jews who survived German occupation, one obtains about 2 million or even fewer surviving Soviet Jews. The contradiction of so many Jews serving and dying in the Red Army, even though most Jews supposedly fell into German hands, can only be resolved in this way.

But there is a catch to it. All in all, 860,000 male Jews of military age were available to the Soviets; most of them were drafted, and 200,000 never returned. At the end of the war, only 660,000 male Jews of this age group remained. Now, if the Soviets restricted themselves to evacuating just half a million male Jews of military age and left the bulk of the elderly, women and children behind to face German annihilation, the surviving 660,000 male Jews would have faced only about 400,000 Jewesses of the same age group – a ratio of 66 to 40! However, such an “upside-down” gender ratio never has been reported in post-war literature – which is very strange.

The opposite proved to be true. The Soviet census of 1959 recorded a gender distribution for the Jews as is “normal” for a population that suffered huge losses of men in two world wars; similar developments occurred in other countries affected by these terrible wars. Specifically, the male/female ratio for Soviet Jews in 1959 was 45.4% (*i.e.* 1,030,629) to 54.6% (*i.e.* 1,237,185).⁴ Ten years later the Soviet census of 1970 began to show the first slight indication of a normalization of the gender structure among the Jews: It was 45.9% to 54.1%.⁵

On the basis of the age distribution of the Jews in the RSFSR,⁶ 705,290 Jews of the recorded 2,267,814 Jews in the Soviet Union (1959) belonged to the age group “0-28 years,” which, at the end of WWII, either had not been born yet or was too young for military service. Its gender structure should have been more or less balanced. The male/female composition among those 29 years and older thus was 677,984 and 884,540, respectively:

⁴ *AJYB*, 1964, Vol. 65, p. 268.

⁵ *Ibid.*, 1976, Vol. 77, p. 165.

⁶ Schmelz, U.O. “New Evidence on Basic Issues in the Demography of Soviet Jews,” *The Jewish Journal of Sociology*, Vol. XVI, No. 2, December 1974, p. 210-214.

Age group	Male	Female	Total
All age groups	1,030,629	1,237,185	2,267,814
0 – 28 years old	352,645	352,645	705,290
29 years and older	677,984	884,540	1,562,524

For the age groups over 28 years this corresponds to a male/female ratio of 43.4/56.6, which is far better than the overall Soviet ratio (1959) of 38.4/61.6 for those aged 30 years and more.⁷

In any case, the age groups which participated actively in both world wars showed a gap of 200,000 in favor of the fair sex. Several tens of thousands of this difference, no doubt, must be attributed to the lower life expectancy of men; further tens of thousands are accounted for by World War *One*. The *Second* World War cannot be responsible for very many more than 100,000 men killed in action.

As mentioned above, Zionist sources put the number of Jews who died in the Soviet armed forces at *at least* 200,000. It is obvious that the Soviet census of 1959 did not register the Jewish population in its entirety; otherwise we would have found more than 100,000 or maybe even 125,000 male casualties of WWII.

The following facts crystallize:

1. More than half a million male Jews served in the Red Army during WWII.
2. It would have been impossible to draft 600,000 soldiers from a population of only two million; therefore, the largest part of the Soviet-Jewish population must have been evacuated by the Soviets to areas outside the German sphere of influence.
3. The contention that the Soviets removed only the male population of military age, leaving the elderly, women and children behind to be annihilated, is untenable; if so, the number of male Jews would have had to be far larger after the war than that of the Jewesses despite the many men killed in action. This, however, is not the case as is shown by the census of 1959 which – 14 years after the war – still evidenced a gender ratio of 43% to 57% in favor of the female sex for the age groups subject to military duty in the Second World War.

The Soviet census of 1959 thus can serve as proof that the mass evacuation of the Jewish population by the Soviets did indeed take place in 1941. At the same time it provides information on the relative size of losses incurred by Jews in the Red Army.

⁷ Statistisches Bundesamt. *Statistisches Jahrbuch für die Bundesrepublik Deutschland*, Wiesbaden, 1962, p. 29 .

How reliable is the Soviet census? The stigma of manipulation attaches to all Soviet statistics. But even leaving this argument aside, the greatest disadvantage must be seen in the manner in which the census was conducted. It was left up to each individual to register for statistical purposes under any nationality desired. In this way, the Soviets provided an opportunity not only for the assimilated Jews but also for those who still maintained ties to Judaism, not to appear to the outside world as Jews; in view of the anti-Semitic attitudes of large sections of the Slavic and Baltic populations, many Jews tried to evade recognition by having themselves recorded as Russians, etc.⁸

Fortunately, other means exist for verification. During the 1970s a growing number of Jews left the Soviet Union for Israel. Contrary to the immigrants of the first post-war years – mainly from Europe – whose male/female ratio among those aged 50-64 years averaged 49/51,⁹ the elderly Jewish immigrants from the USSR in the years 1976-1979 recorded a male share of only 37-40%:¹⁰

1976	40%
1977	37%
1978	38%
1979	37%

In other words, the Jews arriving in Israel from the Soviet Union showed a gender ratio roughly in line with that indicated by the Soviet census of 1959.

We can summarize as follows: The Soviet census of 1959 is reasonably correct as far as the gender and probably also the age distribution of the Soviet Jews is concerned, but it vastly understates the total number of Soviet Jews.

The figures published before 1959 in post-war literature of about two million surviving Jews in the Soviet Union are *by no means* based on *official* Soviet statistics. The way this number was “created” originally is described by the *Year Book*:¹¹

Statistics concerning the Russian Jews were meager and not always reliable even before the war. [...] Pieced together from a wide variety of unofficial Soviet data and other sources, available information is necessarily fragmentary and often hypothetical. There is no adequate basis for presenting a complete

¹¹ *AJYB*, 1947, Vol. 49, p. 393-397.

picture of present-day Soviet Jewry or assessing the far-reaching changes caused by the war and the period of post-war reconstruction. [...]

In 1939-40 the eastern part of Poland, Bessarabia and Bukovina, and the Baltic states were incorporated into the USSR. [...] the total number of Jews within the boundaries of the Soviet Union before the outbreak of the Russo-German war in June 1941 can therefore be taken as about 5,500,000, including about 350,000 war-refugee Polish Jews. Corliss Lamont (The Peoples of the Soviet Union, Harcourt, Brace & Co., New York, 1946) estimates the number of Soviet Jews at this period as 5,300,000, exclusive of non-Soviet refugees.

But these figures by themselves contribute little to an estimate of present Jewish population of the Soviet Union. For this we would have to know not only the number of those who lost their lives as a result of Nazi atrocities, but the birth rate of the Soviet Jews, the number of Jewish soldiers who fell during the war, mortality among those deported and evacuated to Central Asia and Siberia, and the scope of postwar repatriation to Poland and Rumania. Only on the last of these points, however, do we have accurate information. Of about 350,000 Jews from Eastern and Central Poland who sought refuge in the Soviet zone in 1939-40, the vast majority were deported by the Soviet authorities to Siberia, Central Asia, etc. (a substantial number to concentration camps). It must be emphasized that these people went as compulsory exiles, not as refugees. A few thousand left the USSR with the Polish army evacuated to Iran in 1942, approximately 150,000 returned to Poland in 1946, and only a few thousand elected to stay in the USSR. The remainder – about 200,000 – probably died there.

The most conspicuous discrepancies concern the estimated number of victims of the German mass-murders. These estimates range between 1,500,000 (Corliss Lamont, op. cit.) and 3,000,000 (Jacob Lestschinsky). Only an insignificant percentage of Jews (perhaps only 1 per cent) who remained in the territories overrun by the Germans managed to escape alive. The number of Jews evacuated from these territories prior to the German occupation is, therefore, exceedingly important, but this cannot be accurately determined. It seems certain that the optimistic estimates published outside the Soviet Union both during the war and at its close were exaggerated. The German occupation of the Baltic states, the Ukraine and White Russia – all areas with large, concentrated Jewish settlements – proceeded very quickly, and the Soviet transportation system was unable to carry out the evacuation speedily enough, nor on a sufficiently large scale. Many evacuation transports were overtaken by the swift German offensive.

Kulischer, in his study The Displacement of Population in Europe (International Labor Office, Montreal, 1943), estimates that 1,100,000 Jews from the pre-1939 territory of the Soviet Union, 30,000 from the Baltic States, and 500,000 from Western Bielorussia and Western Ukraine, were evacuated into unoccupied Soviet territories. In this latter figure he includes those forcibly deported in 1939-1940. Others consider these figures excessive.

These discrepancies naturally lead to different estimates as to the number of Jews living in Russia. Even Dr. Frank Lorimer of Princeton, an outstanding authority, in his work, The Population of the Soviet Union: History and Prospects (Geneva, League of Nations, 1946), does not venture such an estimate. Unofficial Soviet publications mention 2,500,000 as the present [1947] Jewish population of the USSR. This figure, which is also Kulischer's estimate, (Rescue, July-August 1946), appears to be exaggerated. [...] These unofficial estimates are severely criticized by the Jewish economist Jacob Lestschinsky. According to his analysis, the total number of Jews within the present Soviet boundaries does not exceed 1,500,000 (The New Leader, March 8, 1947, New York). He claims to have calculated, on the basis of unofficial Soviet information, that the maximum number of Jews living in the 60 major settlements of European Russia is 800,000. To the smaller settlements of the European part of the USSR, Lestschinsky ascribes a figure of less than 100,000 Jews; to the Asiatic parts, 500-600,000 Jews. Thus he arrives at his total of 1,500,000 Jews in the Soviet Union.

This figure, when compared to the 5,500,000 Jews on Soviet soil before the outbreak of the war in 1941, shows a difference of 4,000,000. To explain these missing 4,000,000 Jews, Lestschinsky estimates that about 200,000 Jewish Red Army men lost their lives in the fighting, and about 500,000 Jews died in Siberia and Central Asia (principally from among the deported and evacuated). It would thus follow that the Germans massacred more than 3,000,000 Soviet Jews. Lestschinsky's figures are also, obviously, hypothetical.

The Research Department of the American Jewish Joint Distribution Committee in New York estimates the present number of Soviet Jews as 1,800,000. This includes the Asiatic provinces, but is exclusive of the Baltic states [Lithuania, Latvia, Estonia] where there are reported to be 32,500 Jews. (The pre-war Jewish population of these countries was 255,000.)

The estimates of the JDC appear to be closest to the facts; however, until the publication of official, reliable statistics, the actual present Jewish population of the USSR cannot be definitely determined.

In the following year's issue the *Year Book* wrote again:¹²

[...] neither the Russian-Jewish organizations nor the general USSR statistics contain information on this very important subject. Our estimates, based on a careful study of Russian and Jewish material concerning persons evacuated to the unoccupied part of the country [...]

Here is the confirmation of a leading Zionist publication that the information on Soviet Jewry is fragmentary at best, that the number of Jews supposedly killed by the Nazis is totally unknown, and that the guesswork about the number of Jewish survivors in the Soviet Union has led to great differences of opinion and figures of a purely speculative character. It is even admitted that the number of only two million or fewer surviving Jews

¹² *Ibid.*, 1949, Vol. 50, p. 696.

rests on two *hypotheses*: First, the Germans allegedly killed most of the Jews who remained behind in German-occupied territory. Secondly, it is *assumed* that only a small part of the Jewish population managed to escape. The “estimates” for the number of the deported supposedly have been arrived at by a “careful study” of Russian and Jewish material on the number of people evacuated to the unoccupied territories. The lack of diligence applied becomes obvious when one observes that the enormous evacuation carried out by the Soviets in 1941 is simply denied. That’s how history is fabricated.

Revised Estimates

The number of two million surviving Jews in the Soviet Union is seen to be without foundation, as the “creators” of that figure freely admit. Still, they had to wait until 1959 for an official confirmation of this hypothetic figure when the Soviets conducted a census in 1959; the published figure of 2,267,814 was not all that different from Zionist “estimates.” To be sure, it was known that the Soviet method of taking a census leads perforce to too low a Jewish population figure, but, said the *Year Book*, there is nothing one can do but accept it. It continued:¹³

The question of the number of Jews in the Soviet Union was to a large extent answered by the publication of the January 1959 census of Soviet population.

However, the following census of January 1970 recorded only a Jewish population of 2,151,300 – 117,000 fewer than eleven years before.¹⁴ The Soviet demographer A.M. Maksimov commented, in the USSR there is going on “a process of fusion of nations which, under the conditions of a socialist society, has the character of friendship [...]”

Shaken by this process of friendship, the Zionists noticed that the Soviets were engaged in having the Jews disappear statistically in a slow but steady manner. The *Year Book* objected: “[...] a ‘hidden’ Jew, or an assimilated Jew, remains a Jew and should be counted as such,” and “it is questionable whether one should accept improbable figures supplied by a not overly friendly source.”¹⁵ An excellent question. In any case, the *Year Book* is again of the opinion that under the circumstances it is impossible to specify at present the exact number of Soviet Jews.

To be sure, already prior to 1970 the press carried reports that there are probably more Jews in the USSR than “estimated” until then; but ever since about that year, reports are regularly being published which draw an entirely different picture of the numerical size of post-war Soviet Jewry.

¹³ *Ibid.*, 1961, Vol. 62, p. 284.

¹⁴ *Ibid.*, 1971, Vol. 72, p. 403.

¹⁵ *Ibid.*, 1972, Vol. 73, p. 536.

Among the most prominent was the *Year Book*, which admitted that well-informed Russian Jews in the USSR and Soviet emigrants continue to assert that there are up to 4,000,000 Jews in the Soviet Union.¹⁶ Similar figures were mentioned by the *New York Times* on January 22, 1975.¹⁷

Prof. Shapiro, who is in charge of the Jewish world demographic statistics published by the *Year Book*, wrote:¹⁸

The estimate of the emigrants is also important since all of them (with whom I spoke) suggest a more or less similar figure, which they say is current among the Jews in Russia.

The *Judaica*, too, behind which there are Zionist personalities of the stature of an Arthur J. Goldberg and Dr. Nahum Goldmann, speaks of 3 to 4 million Jews in the Soviet Union at the beginning of the 1970s.¹⁹

Prof. Michael Zand, who is teaching at the Hebrew University in Jerusalem today and who left the Soviet Union after a great many difficulties some years ago, said, according to a report by the Israeli newspaper *Beth Shalom*, that there are still 4.5 million Jews in the USSR as far as he knows. In his opinion, the official statistics of the Soviet Union reflect merely those Jews who are willing to acknowledge their Jewish nationality.²⁰

We should note at this point that a Soviet census does not represent the official Soviet version on the question of the actual number of the Jewish population. In that society the purpose of a census is not at all to determine the numerical size of a particular people in an ethnic sense. It was possible, for instance, that, due to a change in the definition of nationality between 1926 and 1939, the share of the Russians increased from 52.9% of the total population to 58.1% despite the fact that the fertility of the Russians was not only below the national, but also below the Ukrainian and the White Russian averages. Following the territorial expansion in the years 1939/1940, the Soviet Union acquired another 25 million inhabitants – Ukrainians, White Russians, peoples from the Baltic countries, Rumanians (but only very few Russians). One should have expected, therefore, that the Russian share would have dropped back to about 51% before the outbreak

¹⁶ *Ibid.*, 1977, Vol. 78, p. 432.

¹⁷ *New York Times*, 1/22/1975, quoted in *AJYB*, 1976, Vol. 77, p. 460.

¹⁸ Private letter dated January 3, 1980, from Prof. Leon Shapiro who is in charge of population statistics at the *American Jewish Year Book*.

¹⁹ *Encyclopaedia Judaica*, Vol. 9, p. 542.

²⁰ Kern, Erich. *Die Tragodie der Juden*, Preussisch Oldendorf, 1979, p. 260. With letter dated 8/15/1980 Prof. Zand (Hebrew University of Jerusalem) was requested to confirm the figure of 4.5 million in the Soviet Union ascribed to him; since no answer was forthcoming, another letter was sent to him on 1/2/1981. Thereupon, Prof. Zand answered with letter dated 2/13/1981 asking to have the question sent to him on 8/15/1980 repeated; he promised to reply if at all possible. Unfortunately, he failed to do so in spite of repeated reminders (letters dated 2/25/1981 and 6/18/1981).

of the German-Soviet war. Since then the Russian surplus of births over deaths was below the average, yet still, the census of 1959 recorded the Russian share to be 54.6% of the Soviet population.²¹

It is evident that the “Russians” as shown in the Soviet census include millions of people of White Russian, Ukrainian, Jewish and other origin. Small wonder that other *official* publications – e.g. *Jews in the Soviet Union*, Moscow, 1967, p. 45, by Solomon Rabinovich – speak of 3 million Jews in the USSR.²²

Unfortunately, Western Zionist circles still have not come around to accepting “for the record” a higher estimate of the Soviet Jewish population. Nor is this very surprising, because the overdue correction would, of course, invite inconvenient questions.

Nevertheless, one can observe a slow, almost unnoticeable turn of attitude, if one is willing to scratch below the surface. The *Judaica*, for example, published under the guidance and cooperation of prominent Jewish and Israeli personalities,²³ cites the Jewish population figure in the usual manner as published in Soviet statistics for 1970, but then arrives at the significant conclusion that hundreds of thousands of Soviet Jews were not recorded as Jews during the Soviet census; it continued, “for more correct estimates, see articles on individual cities.”²⁴

Well, we did; and we found fifteen Soviet cities for which Jewish population figures were published in the Soviet census of 1959 and for which the *Judaica* listed corresponding Zionist estimates as well. The comparison is depicted in *Table 10*.

According to the Soviet census of 1959, these fifteen cities included 906,479 Jewish inhabitants, or 40% of all “official” 2.27 million Soviet Jews. The estimates of the *Judaica* arrive at 1,493,000 Jews for the same fifteen cities – 65% more than recorded officially. In other words, among ten Soviet Jews only six acknowledged their Jewish nationality at the time the census was taken. Now, there is no reason why the Jews living in other Soviet cities behaved very differently; the logical conclusion is that leading Zionist circles put the number of Soviet Jews in 1970 at 3¾ million (*i.e.* 165% of 2.27 million).

Considering that cautious estimates for the Soviet-Jewish population are still in the Zionist interest, one may presume that leading and knowledgeable

Table 10: Jewish Population in 15 Post-War Soviet Cities

City	Soviet Census of 1959	Estimates of the <i>Judaica</i> for 1970	Difference
Moscow	239,246	500,000	260,754
Leningrad	162,344	200,000	37,656
Kiev	154,000	200,000	46,000
Odessa	102,200	180,000	77,800
Kishinev	42,934	60,000	17,066
Minsk	38,842	55,000	16,158
Riga	30,267	38,000	7,733
Baku	26,263	80,000	53,737
Rostov	21,500	30,000	8,500
Donetsk (Stalino)	21,000	40,000	19,000
Gorki	17,827	30,000	12,173
Nikolaev	15,800	20,000	4,200
Shitomir	14,800	25,000	10,200
Dnepropetrovsk	13,256	25,000	11,744
Proskurov	6,200	10,000	3,800
15 Cities	906,479	1,493,000	586,521
	(100%)	(165%)	(65%)

Source: *Encyclopaedia Judaica*, Jerusalem, 1972 (div. volumes)

ble world Zionist personalities themselves believe that the real size of the Jewish population in the Soviet Union is as high as 4 (four) million! One example of the restraint with which these estimates for Soviet cities listed on *Table 10* have been arrived at, is offered by another unsuspecting Zionist source, the *American Jewish Year Book*: It put the Jewish population of Leningrad, for instance, as high as 325,000 in 1963 already; this is 60% more than admitted to by the *Judaica*, and 100% more than the number found by the Soviet census of 1959.²⁵

The complete lack of credibility for the official Soviet statistics on the number of Soviet Jews can also be demonstrated by the example of Moscow. In 1940, this Russian city contained at least 400,000 Jews (see Second Chapter), but in 1959 only 239,000 were reported by the census. This is strange. The Germans never occupied Moscow, and the attractiveness of this hub of Soviet life with its incomparable career possibilities more likely than not increased during these decades. A reduction of the Jewish minority by 40% (!) between 1940 and 1959 is completely out of the question. To the contrary, reinforced by a migration to this city from other sections of the country, Moscow's Jewish population should have been expected to increase, and even the *Judaica's* estimate of 500,000 Jews in 1970 appears conservative.

²⁵ *AJYB*, 1962, Vol. 63, p. 350.

According to the calculations of this study, the USSR was inhabited by 4.3 million Jews at the end of World War Two. Is there a logical explanation for a possible reduction of this number to 4 million or less during the 25 years between 1945 and 1970? There are many indications that the Soviet Jews suffered indeed a drastic numerical decline during the *post-war period*. The huge war losses among men and the enormous children mortality rate in the course of the Soviet evacuations in the years 1940/1941 were mentioned already. These developments were compounded by the high degree of urbanization (96%) of Soviet Jews.²⁶

Another factor – probably the most important today – for a negative growth balance is the trend toward assimilation through mixed marriages; this development set in long before WWII, and grew in strength after the war. As a rule, the children born to these couples are lost to the Jewish nationality.²⁷ In 1926 already 26% of all Jewish males living outside the Ukraine and White Russia married gentile women; in the latter two provinces, the percentage was only 4.6 and 2.0%.²⁸

The shift of the Jewish population center from the traditionally anti-Semitic regions (Ukraine and White Russia) to the north and east persisted ever since the Revolution, and was further reinforced by the mass deportations of 1940/1941. *The Year Book* complained:²⁹

According to a reliable source, intermarriages involving Jews in Moscow and in Leningrad had reached about 50 per cent in the early 1960s. The same source indicated that in the new cities of Siberia – many with a young academic population – the rate remained extremely high.

Of course, mixed marriages do not change the nationality of either partner. But if the children from these marriages are lost to the ethnic minority, the effects on the natural growth of this ethnic group are the same as if those marrying outside their group remain childless.

If, as the *Judaica* maintains, 20% of the Soviet Jews of the postwar period lived in Leningrad and Moscow,³⁰ where every second member of the Jewish community married outside his nationality, the effect is the same as if 10% of all young Jews of marriageable age remain without children. Zionist literature claims, however, that these two cities are not unique in this respect. In the 1920s the percentage of mixed marriages involving Jews was less than 5% in the traditionally anti-Semitic regions of the Soviet Union. Assuming that the native population of these non-Russian areas continues to exhibit those attitudes even today, although possibly in a milder

²⁶ Ettinger, S. "The Jews in Russia at the Outbreak of the Revolution," *The Jews in Soviet Russia since 1917* (Lionel Kochan, ed.), London, 1970, p. 35.

²⁷ *AJYB*, 1976, Vol. 77, p. 472.

²⁸ *Universal Jewish Encyclopedia*, Vol. 9, p. 670.

²⁹ *AJYB*, 1973, Vol. 74, p. 481.

³⁰ *I.e.* 700,000 (see *Table 8*) of about 3-4,000,000 (see footnote 19).

form, the share of mixed marriages among the Jews living there – about 45% of all Soviet Jews – might have risen to, let us say, ten per cent.

Conceding furthermore that the Jews living outside the traditional settlements in the south and west, but excluding Moscow and Leningrad, did not experience the enormous mixed marriage rate of the two metropolitan areas, one can use a rate of 30% as a starting point; in this case, the incidence of mixed marriages among the Soviet Jews might appear as follows:

Region	Percentage of Jews in the USSR	Percentage of mixed marriages	“Childless” Jewish mixed marriages partners
Moscow and Leningrad	20%	50%	10.0%
Other areas in the north and the east	35%	30%	10.5%
Ukraine, White Russia, Mol- davia and Baltic area	45%	10%	4.5%
			25.0%

Following this hypothetical example, every fourth Jew in the Soviet Union remains “without children” – at least as far as the growth of his nationality is concerned – because he is marrying outside his ethnic group and because the children born to these mixed couples are lost to the Jewish minority as a rule. Now, the purpose of this exercise was not at all to pinpoint the exact percentage of “childless” Jews (as defined); it does not matter at all whether the average percentage of mixed marriages among Soviet Jews is closer to 20 or 30% or even higher. The fact is that mixed marriages are extremely common among the Jews of the USSR. Inasmuch as the highly urbanized Soviet Jews had a preference for the small family in the 1920s already (as shown by Prof. Lorimer), and total births in those days barely managed to cover natural mortality, one has to presume that the enormously strong trend toward mixed marriages in the post-war period must have resulted in large annual excesses of deaths over births.

The Israeli demographer and professor U.O. Schmeltz of the Hebrew University in Jerusalem reported that only 7% of the Jews in the Russian Soviet Federated Socialist Republic (RSFSR) belonged to the age group “0 to 10 years,” and 26.5% were sixty years and older – a very high “aging” indeed. For the sake of comparison: the Federal Republic of Germany, which does not have a “young” population, had percentages of 13.5 and 19.7%, respectively, in 1977. The extent of “aging” of the Soviet Jews and their lower birth rate is shown in the table below:³¹

³¹ Schmeltz, U.O. “New Evidence on Basic Issues in the Demography of Soviet Jews,” *The Jewish Journal of Sociology*, London, Vol. XVI, No. 2, December 1974, p. 214.

<i>Jews in the Russian Federated Republic (RSFSR)</i> <i>Distribution by Age – 1970</i>		
Age Group	Share (%)	Average Share per Year
0-10 years	6.9	0.63
11-15 years	4.3	0.86
16-19 years	3.9	0.98
20-29 years	10.9	1.09
30-39 years	15.1	1.51
40-49 years	16.1	1.61
50-59 years	16.3	1.63
60 years and older	26.5	?
Total	100.0	

Considering that the men in the age groups from 40 to 59 years had suffered huge losses during the war, their share would have been even larger without this external effect. It is fairly obvious that the decline of births is not a post-war phenomenon but that it started decades before the war. In the 1960s, finally, the birth rate seems to have fallen to 6 per 1,000 Jewish persons; but in order just to maintain their population size, the share of the youngest age groups would have had to be more than twice as large!

The very large proportion of the older age groups indicates also a rather high natural mortality rate. Prof. Schmelz wrote that the natural decrease of the Soviet-Jewish population amounted to 1 (one) per cent per year between 1959 and 1970! The above age distribution shows furthermore that a population decline must have been recorded in the 1950s already. And there are no signs whatsoever that this situation has improved during the past ten years. Even if there had been a surplus of births over deaths right after the war, this must have been of a very short duration due to the catastrophic losses of men in the war and the difficult post-war conditions; this is definitely indicated by the relative size of the age group “20 to 29 years.”

The size of the average excess of births over deaths in the post-war period cannot be determined with the data available. Prof. Schmelz argues that the Jewish population of the other Soviet republics registered essentially the same age distribution as the RSFSR. All we know is that since 1945 the Jewish population must have suffered substantial negative average growth rates. Whether this deficit averaged a rate below or above minus 0.5% is impossible to determine, given the paucity of Soviet statistics.

As mentioned above, the number of Soviet Jews at the end of WWII must have been 4.3 million at most. Applying various average negative growth rates for the period since 1945, and accounting for the roughly

250,000 Jewish emigrants between 1970 and 1980³² – before 1970 emigration was negligible – we obtain the following alternative developments:

Average decrease per annum since 1945	Jewish Population in the Soviet Union	
	1970	1980
a) –0.3 %	3.98 million	3.61 million
b) –0.4 %	3.88 million	3.48 million
c) –0.5 %	3.77 million	3.35 million
d) –0.6 %	3.69 million	3.23 million

Obviously, it is not just a possibility, but there is a high degree of probability that the Soviet-Jewish population fell by more than 10% below 4.3 million by 1970. This figure is completely in accord with statements by Soviet Jews on the size of their ethnic group in Russia; Prof. Shapiro from the *Year Book* confirmed this in writing.

Even the *Judaica*, whose estimates of the Jewish inhabitants of individual Soviet cities point to a total population of just under 4 million, concludes that this number of present-day Jews in the USSR is not the result of a positive natural growth; it wrote:³³

Moreover, there are fragmentary indications and a general likelihood that the growth of the Jewish group in the U.S.S.R. since the War has been small, if there has been any at all (because of aging, enhanced by war losses; low fertility; intermarriage; assimilation pressure by the majority population; etc.)

This is putting it very cautiously. The *Judaica* could have said as well that at the end of WWII there were at least as many Jews in the Soviet Union as there are today, probably even more – over 4 million!

In this connection we received an interesting admission from Dr. Nahum Goldmann, the one-time chairman of the World Jewish Congress. He declared without qualifications that the Jewish population group in the USSR numbered about three to three-and-one-half million people in 1980.³⁴ This figure corresponds to a population size which might have been expected considering the emigration of a quarter million Soviet Jews in the 1970s and a negative growth rate of at least 0.5% per year since 1970. Now, since he is probably one of the last persons who would tend to exaggerate the size of the Soviet-Jewish population, we are confronted with the following facts: In 1970, the number of Soviet Jews was probably somewhat less than 4 million, and today it is around 3.5 million, after several hundreds of thousands of Jews had left the USSR in the interim period.

³² *New York Times (The)*. “What Price a Soviet Jew?”, in *International Herald Tribune*, Paris, March 6, 1981, p. 2.

³³ *Encyclopaedia Judaica 1973 Year Book*, Jerusalem, 1974, p. 190.

³⁴ In reply to a personal letter dated Feb. 5, 1981, Dr. Nahum Goldmann replied in writing through his secretary on Feb. 13, 1981, that “the Jewish population of the Soviet Union counted approximately three to three-and-one-half million persons.”

The Jewish Cost of Lives and Overall Soviet Losses

Obviously, our calculated number of 4.3 million surviving Soviet Jews is confirmed by respectable and knowledgeable Jewish sources. The remaining question is thus how the losses suffered by the Jews in the USSR compare to the overall losses of the Soviet population. The American engineer John Scott, who worked for years in Stalin's armaments industry and was married to a Russian woman, published a book upon his return from Magnitogorsk. There he describes how the inhuman Soviet "work methods" caused millions of men and women in Siberia to die of hunger and cold while further millions succumbed to the unspeakable living conditions.³⁵

Following the huge losses of the Red Army, the Soviets mopped industry ruthlessly for men needed in the formation of armies which were to replace those annihilated. In their place, women were mobilized who had to work day and night in two shifts like Stakhanovites. In order to muster the last bit of energy, the so-called "Marshall-Plan" – honoring Stalin's self-appointment to Marshall of the Soviet Union – was initiated: Every Soviet resident aged 14 to 70, regardless of sex, was obligated to double his output, even if he was working at maximum capacity already. People died like flies.³⁶

Willkie, who visited the Soviet Union in September 1942, described the conditions he found there as follows:³⁷

Food in Russia this Winter will be scarce – perhaps worse than scarce. [...] Fuel will be little known this Winter in millions of Russian homes. Clothing except for the army and essential war workers is nearly gone. Many vital medical supplies just don't exist. Russian women by the millions side by side with their children – some of them as young as eight and ten – are manning machines in the war factories and running the farms. Every able-bodied man is in the army or giving the maximum hours of hard work [...]

The magnitude of this human tragedy was reported in 1943 by Paul Holt, the Moscow correspondent of the London newspaper *Daily Express*. Returning to London after a 15 month stay in the Soviet Union, Holt wrote that *until then* the Soviets had lost 30 million fallen and wounded soldiers, prisoners-of-war and civilians who had died of hunger and illness.³⁸ It is not known how this huge figure should be divided between military and civilian losses, but certainly the bulk must be attributed to the Red Army. At that time, 5.4 million Red Army men were taken prisoners-of-war by

³⁸ *Daily Express*, "Your Questions about Russia – Answered by Paul Holt," London, (a few days before) May 6, 1943.

the Germans,³⁹ and a similar number must be allowed for the fallen soldiers. Adding several millions of wounded, there remain 10-15 million civilians who died of hunger, epidemics and cold. Further losses running into the millions occurred until the end of the war.

We noted in the Third Chapter that the total population in the Soviet Union numbered at least 202 million at the beginning of the war in June 1941. We do not know its size as of May 1945, since the first post-war census was taken in 1959, followed by a second in 1970. Between 1959 and 1970, the Soviet population increased by 33 million from 209 million to 242 million – a growth rate of 1.3% p.a. But, inasmuch as the Soviet peoples, too, experienced a decline of their fertility following the first baby boom years after WWII, one has to presume that the natural growth rate was somewhat higher between 1945 and 1959 – let us say, 1.5%. This means that there must have been an increase by 39 million in those 14 years. In other words, there could have been no more than 170 million people in the USSR by the end of the war – 32 million fewer than at the beginning of the war.

Red Army losses during WWII are said to have totaled 13.6 million;⁴⁰ accordingly, 18.4 million dead must have been suffered by the civilian population. The respective figures for the Soviet Jews were 200,000 and 830,000 for a total of 1,030,000. In relation to the total population, the Soviet Jews registered a rate of military losses of “only” 3.8% (200,000 of 5.3 million) compared to the horrendous 6.7% (13.6 million of 202 million) of the overall Soviet population. Obviously, the Soviet Jews were engaged to a much smaller degree in the actual fighting, because they were sorely needed in the armaments industry. These facts explain why the census of 1959 showed the overall Soviet population having a considerably smaller percentage of men (of the war generation) than was true for the Jewish segment, namely, 38.4% to 43.4%.

However, the Jews registered a much higher overall and civilian loss:

Civilian losses of the

– entire Soviet population	9.1% (18.4 million of 202 million)
– entire Jewish population	15.7% (830,000 of 5.3 million)

Total losses of the

– entire Soviet population	15.8% (32 million of 202 million)
– entire Jewish population	19.4% (1,030,000 of 5.3 million)

This method of analysis does not pay attention to the fact that large portions of the Slavic and Baltic populations, but only relatively few Jews, remained behind in German-controlled territory. We found only about 65

³⁹ *Kauener Zeitung*, “18 Millionen Gesamtverluste der Sowjets,” No. 149, 6/28/1943, p. 1.

⁴⁰ *Die Tat*, Zürich, “Die erschütternde Bilanz zweier Weltkriege,” No. 18, 11/8/1955, p. 2.

million people in the occupied areas, including almost three-quarters of a million Jews. Looking at it from the other side, 137 million Soviet residents were under Soviet domination, including 4.61 million Jews outside the German sphere of influence. Comparing this Soviet-controlled population to the human losses, one obtains the following figures:

<i>Civilian losses of the</i>	
– Soviet population <i>outside</i> the German sphere of influence	13.4% (18.4 million of 137 million)
– Jewish population <i>outside</i> the German sphere of influence	18.0% (830,000 of 4.61 million)
<i>Total losses of the</i>	
– Soviet population <i>outside</i> the German sphere of influence	23.4% (32 million of 137 million)
– Jewish population <i>outside</i> the German sphere of influence	22.3% (1,030,000 of 4.61 million)

Thus, while the military losses of the non-Jewish population were considerably larger than those of the Soviet Jews, the civilian losses of the Jews and non-Jews who remained under Soviet control showed the opposite development. Reasons for this phenomenon are not difficult to find: Already in 1940, the Soviets deported a relatively large segment of the Jews from the western territories to Siberia; of the three-quarters of a million Jews in question, hundreds of thousands died on the way, and many others of these “foreign elements” lost their lives in Siberian labor and concentration camps due to cold, undernourishment and physical exhaustion. Children especially were affected by this barbarous treatment. In the case, of the evacuated Slavic population in 1941, large portions were men of military age; as a result, the proportion of the very old and children was relatively small. Both factors affected the disproportionately larger civilian losses among the Soviet Jews.

Yet, it is interesting that the total losses of the population remaining under Soviet control were just about equal for Jews and non-Jews – roughly 23%! However, since Stalin had evacuated about 80% of the Jewish population, but only a fourth of the other, mainly Slavic residents, the Jewish total losses were noticeably higher (20%) than those of the entire Soviet population (16%). In short, the massive Soviet evacuation during WWII proved to be the single most important cause of the huge human losses suffered by Soviet Jewry.

The calculated number of 4.3 million surviving Soviet Jews thus turns out to be quite realistic: Statements by Dr. Nahum Goldmann, the *Judaica* and the Soviet-Jewish dissidents confirm it. For the purpose of this analysis it is of no significance whether the actual number is closer to 4 or 4½ million. Whatever the case may be, the Jewish losses are quite in line with the

decimation experienced by the entire Soviet population as a result of Stalin's evacuation, forced labor and battle strategies.

PART II

THE WESTWARD DRIVE

SIXTH CHAPTER:

The Jewish Fate in German-Occupied Europe

France, Benelux Countries, Denmark, Norway and Italy

The victory of German arms in the West affected almost half a million Jews in Denmark, Norway, Luxemburg, the Netherlands, Belgium and France, including more than 90,000 refugees, according to the American Jewish Committee.¹ Reitlinger arrives at a similar figure:²

In the six weeks between May 10th and June 25th, 1940, not less than 350,000 Jews of Western Europe passed under German rule . [...] a further 130,000 Jews came indirectly under German orders in Vichy territory.

If one adds the 8,000 Jews of Denmark and Norway to these 480,000 in France and the Benelux countries, one does indeed obtain the “nearly half a million” of the American Jewish Committee.

Yet, some reservations are in order as far as the actual number of Jews in these countries is concerned. Before the outbreak of hostilities, Jewish refugees from Greater Germany and eastern Europe were to be found in all western European countries. After the fighting erupted, many Jews – mainly foreigners – fled from Holland to Belgium. Native and other Jews living in Belgium escaped together with those from Holland to France; in many cases, they were rounded up by the Belgians, forcibly interned – affected were mainly male refugees with German passports – and transported by rail to France, where they were put in French concentration camps and subjected to terrible hardships, if we may believe Zionist reports.³ The American Jewish Committee estimated the number of refugee Jews living in Belgium and in Holland before the “invasion” at 25,000 and 23,000, respectively. The total number of Jews escaping from the Benelux countries to France during the few weeks of fighting reached perhaps 30-40,000, but the reports differ greatly from each other.

The number of Jews in France was augmented in November 1940 by an additional 10,000 German Jews deported from the Palatinate and Baden; it

¹ *AJYB*, 1940, Vol. 42, p. 595.

² Reitlinger, *Final Solution*, p. 71.

³ *AJYB*, 1941, Vol. 43, p. 324.

is possible that up to 100,000 German, Czech and Polish Jews lived as refugees in France.⁴ In turn, many Jews left France for other countries in the course of time: Switzerland, Portugal, Spain. The Institute of Jewish Affairs places the number of Jews who escaped from France until August 1943 at 30,000.⁵

There are no precise pre-war figures available on the native Jewish population of France and the Benelux countries. Only Holland counted its Jews in the census of 1935, and found 111,917.⁶ Estimates of Belgium's, France's and Luxemburg's Jewish population for the pre-war period – refugees from Germany and eastern Europe excluded – show great differences. In any case, the total number of Jews we are concerned with in the case of these four countries is 460,000 (*i.e.* 350,000 plus 130,000 plus 10,000 minus 30,000).

Denmark and Norway counted 8,000 Jews; of these, 7,000 fled to Sweden in 1943.⁷ Italy's census of 1931 found 47,825 Jews,⁸ but in 1938 the figure was much higher at 57,425,⁹ because Italy, too, was a target of Jewish migration before the war. Until September 1943, when Germany occupied the peninsula after Italy's defection, the country's Jewish population had decreased by 9,000 to 48,000 as a result of flight and emigration (Switzerland, North Africa, etc.).¹⁰ In total, the number of Jews in these seven countries within the German sphere of influence reached 525,000 in 1941.

If one can believe Reitlinger, the German authorities carried out the following deportations:

Netherlands	110,000 ¹¹
Belgium	25,437 ¹²
Luxemburg	512 ¹³
France	65,000 ¹⁴
Denmark and Norway	893 ¹⁵
Italy	10,271 ¹⁶
	<hr/> 212,113

Of these, the following returned:

⁴ *Ibid.*, p. 325.
⁵ Institute of Jewish Affairs, *Hitler's Ten-Year War*, p. 265.
⁶ *AJYB*, 1939, Vol. 41, p. 585.
⁷ Reitlinger, *Final Solution*, p. 349 and 351.
⁸ *AJYB*, 1940, Vol. 42, p. 602.
⁹ *Ibid.*, 1939, Vol. 41, p. 585.

¹¹ *Ibid.*, p. 329.
¹² *Ibid.*, p. 494.
¹³ *Ibid.*, p. 87 and 494.
¹⁴ *Ibid.*, p. 328.
¹⁵ *Ibid.*, p. 349 and 351.
¹⁶ *Ibid.*, p. 495.

Netherlands	6,000 ¹⁷	
Belgium	1,276 ¹⁸	
France	2,800 ¹⁹	
Italy	605 ²⁰	–10,681
Deported Jews (net)		<hr/> 201,432

According to Reitlinger these Jews survived:

Netherlands	36,500 ²¹	
Belgium	61,000 ²²	
Luxemburg	500 ²³	
Denmark and Norway	?	
France	238,000 ²⁴	
Italy	39,000 ²⁵	
Total surviving Jews		<hr/> 375,000

Reducing the total number of 525,000 Jews (1941) by the 7,000 who fled from Denmark and Norway and by the 9,000 Jews who escaped from Italy until September 1943, only 509,000 remain; if one subtracts from these the surviving 375,000 Jews, the number of “missing” Jews is reduced to “only” 134,000:

France and Benelux countries	460,000	
Denmark and Norway	8,000	
Italy	57,000	
1941 total		<hr/> 525,000
<i>deduct:</i>		
Danish and Norwegian Jews in Sweden	7,000	
Escaped Italian Jews	9,000	–16,000
		<hr/> 509,000
Purported survivors		–375,000
“Missing” Jews		<hr/> 134,000

Reitlinger, however, asserts that he found at least 201,200, but at most 210,200 “annihilated” Jews, and the Anglo-American Committee even claims to have discovered 341,000!²⁶

The urban Jews of these western European countries showed all the characteristics typical of populations of large cities: Rising mortality rates

and falling birth rates. These four countries – France, Holland, Belgium and Italy – are supposed to have had a total Jewish population of 400,000 in the early 1930s. Looking at this figure a little more closely, it begins to evaporate. The *Universal* published the following mortality figures (Norway, Denmark and Luxemburg were not listed, probably because of the small numerical size of their Jewish populations):²⁷

France	1,500
Netherlands	1,000
Belgium	500
Italy	500

Applying a mortality rate of 1.1% per annum, the Jewish populations must have recorded the following sizes:

France	137,000
Netherlands	91,000
Belgium	45,000
Italy	45,000
	<hr/>
	318,000

It is unfortunate that the *Universal* rounded these numbers to a full 500. In the case of Belgium and Italy, the computed population size is somewhat lower than is usually given by Zionists, but they are still acceptable. For the Netherlands, the calculated figure of 91,000 compares with the census listing 112,000 – a large gap; but this may be explained by the fact that the mortality figure was rounded off to 1,000.

As for France, it does not matter whether we round up or off, whether the mortality rate is pushed down to 0.9%, and whether the number of mortality cases per year is increased even to 1,700; the resulting population figure would always remain below 200,000. Since the mortality figures given for other countries by the *Universal* are generally acceptable, there is no reason why we should reject them in this instance. Consequently, one must conclude that the estimates for the Jews of pre-war France – usually given as 240,000-260,000 (excl. refugees) – are completely wrong and that France probably contained 50-100,000 fewer Jews when war broke out than certain people would like us believe. The only other explanation for this discrepancy is that tens of thousands of eastern European Jews had immigrated in France in the early 1930s – at a time when only few Jews had left Germany. If this is the case, we would have another confirmation for the mass emigration from eastern Europe as mentioned by the pro-Zionist Institute for Contemporary History.

²⁷ *Universal Jewish Encyclopedia*, Vol. 10, p. 36.

Greece and Yugoslavia

Emigration has far exceeded the positive growth rate for *Greek* Jews ever since the turn of the 19th to the 20th century. The result was a continuous decrease in the number of Jews in Greece. This persistent emigration pattern, reinforced by economic misery, probably caused the Jewish population to drop further since the census of 1931 found 67,200 Jews.²⁸ Precise figures are not available for 1940. For this reason, we assumed only a small decline of the Jewish inhabitants to 65,000 during the 1930s.

How many of them were deported? A report by the International Red Cross mentioned only that all male Jews between the ages 18 and 45 years were registered in July 1942 and, after a temporary incorporation in labor battalions, were deported to Germany in May 1943.²⁹ Nothing in the report was said about Jewesses being deported as well. At the end of the war, the Zionist scholar Hilberg claimed to have found only 12,000.³⁰ The rest of 53,000 is said to have been deported. There is a good probability that this figure is untenable in view of the IRC Report, but we accepted it, because we want to base this analysis on Zionist sources, if at all possible.

Hilberg insists that “*mass emigration from eastern Europe was easiest in non-Communist Greece and in the neighboring states of Yugoslavia and Bulgaria.*”³¹ Disregarding his own words, this splendid scholar begins to cite statistics which leave no room at all for emigration from these countries between 1945 and 1948. The assumption that tens of thousands emigrated between 1945 and 1948 – in part, already during the war – and that, finally, only 12,000 remained in Greece in the year 1948 probably is not far-fetched; and yet, these 12,000 of 1948 are listed as the only survivors.

The *Yugoslavian* case is not very different. There, too, we find exaggerations regarding the Jewish population size at the beginning of the war, understatements as to the number of survivors, an inflation of the number of deported and, lastly, no figures at all – not even estimates – on the number of those who emigrated right after the end of the hostilities by way of Italy or Austria to Palestine, overseas or to other European countries.

The census of 1931 counted 68,405 Yugoslavian Jews. Reitlinger believes that emigration could have decreased their number until the beginning of the war or, at least, allowed no further growth.³² Communist post-war Yugoslavia's census of 1946 found only 10,446 Jews. Hilberg, howev-

er, who apparently had finished his count prior to this “census,” discovered 12,000 survivors.³³

One can safely assume that many thousands succeeded in fleeing to Italy and from there to Palestine or overseas, as Yugoslavia, too, belonged to those countries where mass emigration was easiest after the war according to Hilberg. Reitlinger admits to this and says that the census of the Communist government of Yugoslavia hardly can be taken seriously, because many Jews had lived as gentiles during the war years and did not choose to reveal themselves as Jews after the war.³⁴

How many tens of thousands survived for the reasons mentioned and are listed as “missing” in the statistics? And how many emigrated right after the war? We do not know. The number of “missing” Jews for both of these countries adds up to 109,000:

Greece (1939)		65,000 Jews
Yugoslavia (1939)		68,000 Jews
		133,000 Jews
Purported survivors in 1945:		
Greece	12,000	
Yugoslavia	12,000	–24,000 Jews
“Missing”		109,000 Jews

Germany and Austria

As of January 1933, the number of Jews living in Germany was 522,700.³⁵ If one adds the 16,600 Jews of the Saar, Memel and Danzig, their total number was 539,300.³⁶ 281,900 emigrated from the “old” Reich until December 1939, 13,000 from the Saar, Memel and Danzig; another reduction by 38,400 occurred because of an excess of deaths over births. As a result, only 206,000 remained in Germany (“old” Reich) at the end of 1939. The emigrants consisted mainly of the young; most of the elderly remained behind.

The Jewish statistician Dr. Bruno Blau wrote in the *Wiener Library Bulletin* that the Reichsvereinigung Deutscher Juden (Reich Union of German Jews) published data in October 1941 according to which 164,000 Jews were living in Germany at the time.³⁷ This was prior to the large deportations of German Jews to Russia. Dr. Blau said that, of these remaining 164,000, about 13,800 may have died of natural causes. It seems though

³³ Hilberg, *Destruction of European Jews*, p. 670.

³⁶ *Ibid.*, p. 600.
³⁷ Reitlinger, *Final Solution*, p. 492.

that the mortality rate of 2.4% per annum for the 3½ years until the end of the war probably is too low. A population mainly composed of older people where births naturally were the exception simply must have had a much greater natural decrease.³⁸

Be that as it may. Applying the same rate of 2.4% p.a. to the period 1939 to mid-1941, one obtains a natural excess of deaths over births of around 7,000. Thus, if 206,000 Jews lived in Germany in 1939 ("old" Reich), the natural excess of deaths amounted to 7,000, and 10,000 were deported to France in November 1940, then another 25,000 must have emigrated prior to 1941.

19,000 Jews remained at liberty in Germany throughout the war, and a mere 8,000 are supposed to have returned from the various concentration camps after Germany's defeat.³⁹ This leaves 123,000 German Jews unaccounted for.

As for *Austria*, its Jewish population decreased since 1934 because of a negative net birth rate by 10,000 to 181,778 at the time of the unification of Austria with Germany in March 1938.⁴⁰ The ensuing massive emigration (117,000) and further excesses of deaths over births (8,000) reduced the Jewish population to 57,000 at the end of 1939.³⁵

According to reports in the Zionist press, German statistics published on February 5, 1941, put the number of Austrian Jews at 50,000.⁴¹ Applying Dr. Blau's data for the "old" Reich to Austria, the difference of 7,000 must have consisted of a natural decrease by 2,000 and emigration by another 5,000. Reitlinger, though, mentions 4,000 emigrants after 1939. For the remaining four war years, the mortality excess may well have amounted to a further 5,000 (2.4% p.a. of 50,000 in four years).

As for the survivors, Reitlinger has this to say:⁴²

[...] *there survived on October 24th, 1947 [!], some 8,552 Austrian-born Jews in Vienna and a few hundred in Linz and other towns.*"

But he, too, is silent on the number of Austrian Jews who left the camps after the war to proceed directly to Palestine and overseas. The development of the Jewish population in these two German countries appears as follows:

³⁸ According to *Statistisches Jahrbuch für die Bundesrepublik Deutschland*, for example, the mortality rate (in West Germany) for 1977 was 3% p.a. for those aged 47 years and more.

Hungary

The census of 1930 recorded a Jewish population of 444,567.⁴³ In 1941, the census listed 725,007 Jews in Greater Hungary enlarged by the acquisition of neighboring territories.⁴⁴ A direct comparison between the two counts is difficult, because many districts which had been reduced in size as a result of post-WWI border changes were again reconstituted to their former size. Not affected by border changes were the districts located in Hungary's interior; they contained 147,177 Jews in 1930,⁴⁵ but only 132,495 in 1941⁴⁶ – a reduction by 10%. Budapest's Jewish population decreased in the same period from 204,371 to 184,453 – also a minus of 10%. Applying this rate to all of Trianon-Hungary's Jews of 1930, there was a reduction by 44,500 to 400,000 in 1941.⁴⁷

From 1930 to 1939, deaths exceeded births by 14,436, and another 1,600 should be allowed for 1940, bringing the total natural decline between 1930 and 1941 to about 16,000 (0.3% p.a.). Changes in religious preference resulted in a loss of 21,125 between 1930 and 1939 and possibly a further 2,000 in the year 1940. On balance, these changes reduced Trianon-Hungary's Jewish population by about 39,000 until 1941. This leaves another reduction of about 5,500 due to emigration.⁴⁸ Greater Hungary's Jewish population in 1941 thus was distributed as follows:

Census of 1941		725,007
"Old" Trianon-Hungary		–400,000
Newly acquired territories		<hr/> 325,007
Former Slovak areas	42,000 ⁴⁹	
Banat (from Yugoslavia)	25,000 ⁴⁹	
Northern Transylvania (from Rumania)	148,621 ⁵⁰	–215,621
Ruthenia (from Czechoslovakia)		<hr/> 109,386

According to the usual post-war version concerning the developments in Hungary, the Germans deported about 400,000 Jews from Greater Hungary by rail between mid-May 1944 and early July 1944 from the areas outside the capital of Budapest, killing almost all of them in Auschwitz-Birkenau.

⁴³ *Annuaire Statistique Hongrois 1931*, Nouveau Cours XXXIX, l'Office Central Royal Hongrois de Statistique, Budapest, 1933, Tab. 10, p. 11.

⁴⁴ *Magyar Statisztikai Évkönyv 1942*, Új Folyam L, A Magyar Kir Központi Statisztikai Hivatal, Budapest, 1944, Tab. 11, p. 17.

⁴⁵ *Annuaire Statistique Hongrois 1931*, Tab. 10, p. 11.

⁴⁶ *Magyar Statisztikai Évkönyv 1942*, Tab. 11, p. 14-17.

⁴⁷ *Universal Jewish Encyclopedia*, Vol. 10, p. 24, estimated Hungary's Jewish population at the end of 1939 at 403,000.

⁴⁸ *Ibid.*, p. 25; the *Universal* mentions 5,250 Jewish emigrants until 1939.

⁴⁹ Reitlinger, *Final Solution*, p. 415.

⁵⁰ Publikationsstelle Wien. *Die Bevölkerungszählung in Rumänien 1941 (Geheim)*, Vienna, 1943, p. 20.

The killing was supposedly the main purpose of these deportations. With the exception of Budapest, where Jews were left in peace more or less, this operation “cleansed” Hungary of almost all Jews. On January 31, 1941, the number of Jews in Budapest numbered 184,453,⁴⁷ a reduction by 15,000 from the 200,000-figure published by the Jewish statistician Arthur Ruppin for the year 1930.⁵¹

Now, it just so happened that the International Red Cross (IRC) was represented in Budapest during the war and that the Jewish Senate’s headquarters was in the buildings of the IRC. In 1948, the IRC published a report on the events in Hungary during the war, paying special attention to Jewish fate.⁵² It is certain that the IRC knew about all the anti-Jewish measures either through its own sources or else through the Jewish Senate quartered in the same buildings. The report mentions some deportations for the period March to October 1944 without specification of figures. It said:⁵³

[...] from March 1944 onwards, the position of the [Hungarian] Jews became critical, [...] On October 8, the Hungarian authorities, in conformity with the undertaking given to the Committee, announced the final suspension of deportations and made known that the Kistarcea Camp for Jewish intellectuals doctors and engineers, had been broken up and the internees released.

Only after the arrest of the war-weary Horthy-government by German troops did the real misery of the Hungarian Jews begin. The IRC Report continues:⁵⁴

A few days later [after October 8, 1944] the full tide of the great tribulations of the Hungarian Jews was to set in. [...] The replacement, in October 1944, of Horthy’s Government by one in bondage to Germany provoked a violent crisis; executions, robberies, deportations, forced labour, imprisonments – such was the lot of the Jewish population, which suffered cruelly and lost many killed, especially in the provinces. [...] It was immediately decided to remove them from Budapest and to confiscate their property. Sixty thousand Jews fit for work were to be sent to Germany, on foot, in parties of one thousand, by way of Vienna. Moreover, among the able-bodied, men between sixteen and sixty, and women between fourteen and forty were commandeered for forced labour in building fortifications in Hungary. The rest of the Jewish population, including the disabled and sick, was confined in four or five ghettos near Budapest. The only Jews to escape evacuation were those in possession of passports with visas for Palestine, Sweden, Switzerland, Portugal or Spain. [...] In November [1944], one hundred thousand Jews poured into Budapest from the provinces.

⁵¹ Butz, *Hoax of the Twentieth Century*, p. 149.

⁵² *Ibid.*, p. 133.

⁵³ *Ibid.*, p. 138.

⁵⁴ *Ibid.*, p. 138-139.

To repeat: There were certain events before October 1944, including deportations, which were too unimportant for the IRC Report even to bother mentioning the figures; but the *IRC Report emphasizes that the really dangerous occurrences for the majority of the Jews began in October 1944*. The maximum number which the report says were to have been deported was given as 60,000, and nowhere do we find any trace whatsoever that this number was exceeded or even attained. To the contrary, there are indications that the actual number of deportees was even less.⁵⁵ Still, in this analysis we will assume that, including those deported between March and October 1944, the total number of deported Jews from Hungary reached 100,000, which is probably much too high.

Jews were not allowed to serve in the armed forces; the mobilization law prohibited that. Instead, Jews were drafted into an auxiliary service, the Hungarian military labor force. According to Dr. Rudolf Kastner, the former associate president of the Zionist Organization of Hungary, this labor force included at times 80,000 Jews; all in all, about 130,000 Jews had been drafted into this service. Dr. Kastner estimated that 30-40,000 Jews fell while serving in this force.⁵⁶ But the *Judaica* mentioned that in January 1943 alone, after the great Don-breakthrough of the Red Army, when the 2nd Hungarian Army practically disintegrated, 40-43,000 of the 50,000 Jews serving in the military labor force lost their lives in the panic that followed.⁵⁷ If that many died in this one military catastrophe, further losses certainly occurred during the battles of retreat until Budapest. The total number of fallen Jews in the Hungarian labor force must have exceeded the 50,000-mark by far – if Zionist statistics are correct.

Dr. Zoltan Klar, former elected member of the Council of the Budapest Jewish Community, testified under oath at the hearings of the investigating committee of the U.S. House of Representatives of September 22 and 23, 1954, looking into the treatment of Jews by the Soviets. Klar said that the Hungarian Minister in Moscow, Prof. Szekfu, visited the Jewish Council in 1946 and declared that 30,000 Hungarian Citizens, former members of the military labor force, were still in Soviet prisons, as far as he knew; of these, 90% were Jews. Prof. Szekfu thought that they would return home soon. In actual fact, no more than 1,500 ever returned according to Dr. Klar. 25,500 Hungarian Jews had disappeared in Soviet prisons without a trace.⁵⁸

These developments have been summarized in table-form (in 1,000):

⁵⁵ *Ibid.*, p. 144.

⁵⁶ Hilberg, *Destruction of the European Jews*, p. 517.

⁵⁷ *Encyclopaedia Judaica*, Vol. 8, p. 1098.

⁵⁸ *Treatment of Jews by the Soviet*, 1954, p. 85-86.

	Greater Hungary	Trianon Hungary	Ruthenia	Northern Transyl- vania	Slovak areas	Banat
Jewish population 1941	725	400	109	149	42	25
<i>deduct:</i>						
– Deportation to Germany	–100	–55	–15	–21	–6	–3
– Losses in the military labor force	–50	–27.5	–8	–10.5	–3	–1
– Members of the military labor force lost in the Soviet Union	–25.5	–25.5	?	?	?	?
Remainder	549.5	292	86	117.5	33	21

The Jewish losses in the Hungarian military labor force were divided proportionately among all the regions, because no information is available as to the origin of the victims. The same procedure was followed with regard to the 100,000 (max.) Jews deported to Germany in 1944. But Dr. Klar's testimony was quite specific concerning the Jews who were in Soviet prison, and that most of them had disappeared. These were former residents of the "old" Hungary (Trianon-borders), and for this reason we entered the entire figure of 25,500 in the column "Trianon-Hungary." The above table indicates that 292,000 Jews should have been found in Hungary after the war.

As for the natural demographic development during the war, one has to pay due regard to the generally insecure and economically precarious situation of the Hungarian Jews, and to the fact that at times up to 22% of the entire male population (*i.e.* 80,000 of about 360,000 males) was serving in the military labor force. These circumstances must have had a considerable negative impact on the birth rate, which had been too low during the 1930s already.

As was shown in the First Chapter, Greater Hungary's Jewish net birth rate was -0.3% in 1942. This negative figure came about, because the relatively high fertility of the Ruthenian Jews was more than offset by the very unfavorable net birth rate in the other regions. In particular, the Jews of "old" Trianon-Hungary had reached a net natural decrease of 0.5% in 1938 already. Also, it is certainly within the realm of possibility that the fatal circumstances of the war caused a further drop in the birth rate. In Germany and Austria, the negative Jewish natural growth rate was much worse before the war, and it is safe to assume that the situation of the Hungarian Jews during the war was much more difficult than the one faced by German and Austrian Jews before 1938. Between 1930 and 1935, the annual Jewish excess of deaths over births in Germany and Austria was 5,500 and

2,500 respectively.⁵⁹ This is equivalent to an annual decrease of about 1.0 and 1.3%! Following this line of thought, it is probable that the natural decrease of the “old” Hungarian Jewish population during the five war years was near 1% annually, causing a decrease totaling 20,000.

We noted above that Jewish sources claim 2,113 Jews had switched annually from the Mosaic to a Christian faith between 1930 and 1939. It stands to reason that many more Jews must have taken advantage of this possibility during WWII in order to secure a greater personal and economic security for themselves and their families. Even assuming only the same annual number of changes, there would still have been 10,000 conversions during the five war years and a corresponding reduction in the number of adherents to the Jewish faith. Another 6,000 have been found after the war in Rumania.⁶⁰ It is quite possible that these 6,000 Hungarian Jews in Rumania had tried to reach Turkey by way of Bulgaria or the port of Constantza in Rumania. As we go on, evidence will be forthcoming on the massive emigration via these two channels.

As was pointed out, the number of Jews deported to Germany reached at most 100,000; of these, about 55,000 should be applied to “old” Hungary. We know that thousands returned to Hungary after the war from the German camps. Their number, however, is not known. In this connection, the Hungarian Jew Dr. Klar testified before the U.S. investigating committee that the Soviets prevented many of the returning Jews from entering Hungary after the war; instead, they arrested them at the border and transported them, male and female, to the east. He put their number at 40,000 Hungarian Jews!⁶¹

Today’s “official” version of the Jewish fate in Greater Hungary is that, with the exception of the Jews of Budapest, almost all the other Jews were deported *before early July 1944*. Budapest contained 184,453 Jews as of January 31, 1941. But even if one allows for some deportations, natural population decrease, emigrants, proportionate losses incurred in the military labor force, etc., it is still impossible that Budapest was populated by fewer than 150,000 Jews when deportations ceased (July 1944 according to the Zionist version). If one adds those few Jews who survived on the countryside, then it would have been possible indeed that Hungary’s Jewish population had shrunk to only 200,000 by war’s end, as the Anglo-American Committee claims.

This figure is subject to some doubt. First, the International Red Cross was quite clear when it said:⁶²

In November [1944], one hundred thousand Jews poured into Budapest from the provinces.

⁵⁹ *Universal Jewish Encyclopedia*, Vol. 10, p. 36.

⁶⁰ Butz, *Hoax of the Twentieth Century*, p. 141.

⁶¹ *Treatment of Jews by the Soviet*, 1954, p. 72.

⁶² Butz, *Hoax of the Twentieth Century*, p. 139.

In other words, these people fled from areas from which, according to the Zionist post-war version, all Jews supposedly had been removed already! This happened at a period of time when even Zionist reports say the deportations to Germany (“Auschwitz”) had ceased. The U.S. War Refugee Board under the leadership of the Zionist Morgenthau admitted that, as a result of the negotiations between Saly Mayer from the Joint Distribution Committee and SS-Colonel Kurt Becher, the deportation of the *more* than 200,000 Jews living in Budapest in *August* 1944 did *not* take place.⁶³ This means, of course, that *far more than 300,000 Jews must have survived in Hungary* (Trianon-borders) according to the best of sources. We should remember that the IRC Report did not say either that *all* of the Jews had left the provinces and come to Budapest in November 1944.

Secondly, there is no question that thousands of Jews fled west after the war. Hilberg confirms this expressly.⁶⁴ Thirdly, figures for the surviving Hungarian Jews as provided by the Anglo-American Committee (200,000) pertained not to the end of the war but to *April 1946*.⁶⁵ If the figure of 200,000 for 1946 is correct, then this would mean that more than 100,000 Hungarian Jews must have left Hungary during the interim twelve months and gone to the West (Austria and Italy)!

Considering all the fallen, deported and escaped, the number of Jews in Hungary should have been expected to be around one-quarter of a million (see the summary below) – about 50,000 fewer than the more than 300,000 who were actually there. The only possible explanation for this discrepancy is that it reflects the Jews who poured into Hungary from other countries – Poland and Czechoslovakia – looking for a place to hide and relative security. Until April 1946 more than 100,000 had left Hungary – if the figure of 200,000 as published by the Anglo-American Committee is correct.

The following is a statistical summary of the Jewish fate in Hungary:

Jewish population at the end of 1939	400,000	
<i>deduct:</i>		
– Fallen Jews in military labor force	27,500	
– Missing as Soviet prisoners-of-war	25,500	
– Deported east by the Soviet in 1945	40,000	
– Negative net birth rate during the war	20,000	
– Hungarian refugees in Rumania	6,000	
– Conversions to Christian faiths	10,000	–129,000
Remainder		271,000
Purported “survivors” April 1946		–200,000
“Missing” Hungarian Jews		71,000

⁶³ U.S. War Refugee Board. Final Summary Report of the Executive Director, War Refugee Board, Washington, D.C., 9/15/1945, p. 42.

⁶⁵ Reitlinger, *Final Solution*, p. 497.

Czechoslovakia

This state, forcibly established by the “Treaty” of Versailles, experienced a very lively history during its short existence. Its subsequent division makes a separate treatment of the various regions mandatory.

The census of 1930 recorded 356,830 Jews on the basis of religion, regionally distributed as follows:⁶⁶

Czech areas (Bohemia and Moravia)	117,551
Slovakia	136,737
Ruthenia	102,542
Total	356,830

Because of low birth rates, the first two regions registered a slow decrease of the Jewish population, whereas the Jews in Ruthenia proved very fertile. After the Munich Accord, a huge emigration set in, especially from the Czech areas. Reitlinger, who in turn refers to the Anglo-American Committee, reports that at the end of 1939 only 315,000 Jews lived in the former Czechoslovakian territory.⁶⁷

As was pointed out in the First Chapter, Ruthenian Jews were quite fertile; on the other hand, they suffered from a migratory loss of young males who left for the industrial Czech areas. In any case, the Hungarians found only roughly 109,000 Jews in Ruthenia after the dismemberment of the artificial Czechoslovakian state.

In other words, the Jewish population of the first two regions may have been 206,000 in 1939 (*i.e.* 315,000 minus 109,000). This means that the Jews of Bohemia, Moravia and Slovakia decreased by 48,288 (*i.e.* 117,551 plus 136,737 minus 206,000).

Even before the war, Hungary had annexed a section of Slovakia containing 42,000 Jews.⁶⁸ The remaining independent Slovak state is reported to have registered 85,045 Jews in 1939 according to the *Year Book*, which, in turn, referred to news published in *Der Grenzbote* (Bratislava) of January 18, 1940.⁶⁹ Consequently, the total Slovak area must have had 127,000 Jews at the end of 1939. If correct, this would point to a net emigration of 9,700 (a small excess of deaths over births cannot be excluded, though). Thus, the Czech areas cannot have contained more than 79,000 Jews at the end of 1939 (206,000 minus 127,000). Emigration, flight and a negative net birth rate added up to a reduction of 38,600 between 1930 and the end

⁶⁹ *AJYB*, 1940, Vol. 42, p. 597.

of 1939 (*i.e.* 117,551 minus 79,000). Further population losses ensued in 1940.

Reports in the Zionist press, according to which German statistics published on February 2, 1941, put the number of Jews remaining in the “Protectorate” at 70,000, confirm these calculations.⁷⁰ Reitlinger adds that until 1942 another reduction of 7,000 Jews occurred because of emigration from Bohemia and Moravia and continuing low birth rates. All in all, 4,000 Jews are said to have succeeded in emigrating during the war.⁷¹ But as one has to assume that the excess of deaths over births accelerated throughout the war period of 1942-1945, a further deduction of maybe 2,000 should be made. In summary, the Jewish population of the “Protectorate” decreased after 1939 by 4,000 as a result of emigration, and by 5,000 as a result of negative net birth rates.

In 1946(!), one whole year following the defeat of Germany, after Jews had left Bohemia and Moravia in huge droves for the American zone of occupation in Germany – we will come back to this later – Reitlinger still found 32,000 Jews in the former “Protectorate.”⁷²

In *Slovakia’s* case, it is somewhat more difficult to trace the development because of the loss of large areas to Hungary just before the war began. At the outbreak of the war, 85,000 Jews lived in the smaller independent Slovakia. Apart from the 52,000 deported, the remaining Jews lived relatively securely until the end of 1944.⁷³ The IRC wrote:⁷⁴

[...] at certain periods, Slovakia was even looked upon as a comparative haven of refuge for Jews, especially for those coming from Poland. Those who remained in Slovakia seem to have been in comparative safety until the end of August 1944, when a rising against the German forces took place.

The consequence of this uprising was that many Jews were deported. In post-war Slovakia – again, including the areas formerly occupied by Hungary – Reitlinger found 45,000 Jews, whereas Gregory Frumkin managed to discover even 60,000.⁷⁵ Let us agree on 50,000. The fate of the Jews in the Hungarian-occupied Slovak regions was covered in the context of the Hungarian Jews.

Ruthenia, which was part of the Czechoslovakian state until its dismemberment, was first annexed by Hungary, and after the war by the Soviet Union. For this reason, the local Jewish population shared the fate of the Hungarian Jews just like part of the Jews of Slovakia. The human losses of all the Rumanian, Slovak and Serbian Jews under Hungarian domina-

⁷⁵ Reitlinger, *Final Solution*, p. 493.

tion who were made Soviet prisoners-of-war as former members of the Hungarian military labor force is not discussed in the pertinent literature. All we know is that 27,000 Hungarian-Jewish labor force members were in Soviet prisons, and that only 1,500 ever returned. In the case of the Jews of Ruthenia their number would have to be reduced by those who disappeared in Soviet prisons. The remainder of the Ruthenian Jews has been added to the Soviet Union in the Fourth Chapter. Consequently, we will exclude the Ruthenian Jews on account of the annexation of that region by the Soviet Union after the war. The developments in Czechoslovakia can be summarized as follows:

Czech areas (Bohemia and Moravia – 1930)	117,551	
Slovakia (1930)	136,737	
Ruthenia (1930)	102,542	
Czechoslovakia (1930)	356,830	
Ruthenia annexed by the USSR in 1945	–102,542	
Czechoslovakia without Ruthenia (1930)	254,288	
<i>deduct:</i>		
Emigration (incl. excess of births over deaths before the war):		
– Czech areas	38,600	
– Slovakia	9,700	–48,300
Jews in Bohemia, Moravia and Slovakia in (1939)		206,000
<i>deduct:</i>		
Changes after 1939:		
– Emigration from Czech areas	4,000	
– Excess of deaths over births in Czech areas	5,000	
– Fallen Slovakian-Jewish members of the Hungarian military labor force	3,000	–12,000
Remainder		194,000
Purported “survivors”		–82,000
“Missing” Czechoslovakian Jews		112,000

Rumania

The Rumanian census of December 29, 1930, recorded the population on the basis of language, nationality and religion. Accordingly, the “Jewish” figures were 518,754, 728,115 and 756,930, respectively. Since many Jews had already given up Yiddish and, despite their Mosaic faith, considered

themselves of other than Jewish nationality, the figure of 756,930 represents the best indication of Rumania's Jewish population.⁷⁶

In 1940, three neighboring countries acquired slices of Rumanian territory: The Soviet Union on June 28 (Bessarabia and northern Bukovina), Hungary on August 30 (northern Transylvania) and Bulgaria on September 6 (southern Dobrudja). The remaining Rumanian territory – Core-Rumania – counted 328,930 persons of the Mosaic faith at the time of the last census of 1930,⁷⁷ northern Transylvania 148,660, southern Dobrudja 846,⁷⁸ Bessarabia 206,958,⁷⁹ leaving 71,536 for northern Bukovina. In total, the area seized by the USSR in 1940 thus had a Jewish population of 278,494 as of December 29, 1930. Of course, until mid-1940 these figures were subject to change due to natural growth patterns, emigration and a large migration from the country to the cities, especially to Bucharest.

In the seven-year period from December 1930 until early 1938, an average of 724,600 Jews lived in Rumania.⁸⁰ An average growth rate of 0.2% – as suggested in the First Chapter – would have resulted in an excess of births over deaths of 10,200. Thus, about 74,900 Jews must have emigrated during this time:

Census of 1930	756,930
Excess of births over deaths from December 1930 until early 1938	<u>10,200</u>
	767,130
Jewish population in early 1938 ⁸¹	<u>–692,244</u>
Emigration 1930 – early 1938	<u>74,900</u>

During these seven years, 10,700 Jews left Rumania annually. The German Institute for Contemporary History in Munich also counts Rumania among those countries where, because of the poor economic situation, Jews were forced to emigrate in large numbers. It is obvious that the worsening conditions in Rumania in the latter part of the 1930s caused more and more Jews to look for an improvement in their personal lives abroad. Among these were especially the Jews of Bessarabia where many Jewish refugees from the Russian civil war had fled after WWI. Many other Jews sought to es-

⁷⁶ *Recensământul General Al Populației României Din 29 Decembrie 1930*, Volumul II: Neam, Limbă, Maternă, Religie; Institutul Central de Statistică, Bucharest, 1938, p. XXIV.

⁷⁷ *Wirtschaft und Statistik*, October 2, 1941, No. 20, p. 392.

⁷⁸ Publikationsstelle Wien. *Die Bevölkerungszählung in Rumänien 1941 (Geheim)*, p. 20.

⁷⁹ *Recensământul General...*, p. LXXXV.

⁸⁰ In early 1938, the Rumanian Jews numbered 692,244 (see next footnote) compared to 756,930 at the end of 1930; this amounts to an average of 724,600 for the years 1931 to 1937.

⁸¹ The Institute of Jewish Affairs (*Hitler's Ten-Year War*, p. 83) wrote that under the law of January 21, 1938, all Jews in Rumania had to submit proof of citizenship, if they wanted to keep it. 617,396 registered, 44,848 abstained and 30,000 were not qualified to register. This adds up to 692,244 for early 1938.

cape from the growing anti-Semitic tendencies by merging into the larger Jewish communities of the big cities.

The size of emigration in the years 1938, 1939 and 1940 is unknown. However, one may be sure that the deteriorating economic and political situation persuaded even more Jews to emigrate. Even if we limit ourselves to the average emigration rate of the years 1931-1937 and apply that to 1938-1940, and if we concede furthermore that the small excess of deaths over births did not expand in 1939 and 1940, then the number of Jews living in Rumania in mid-1940 could have been 665,500 at most:

Jewish population in early 1938	692,244
Emigration from 1938 until mid-1940	–26,750
Jewish population in mid-1940	665,500

By 1940, it seems, Rumania's Jewish population had decreased by 91,400, or 12.1% since 1930.

On April 6, 1941, a census found only 315,509 Jews in Core-Rumania, 291,674 of whom were urban.⁸² Unfortunately, these figures are not entirely comparable to the census of 1930, because the 1941 census defined "Jews" as including all persons with at least one parent of Mosaic faith. It is unlikely that the latter factor accounted for more than several thousand persons. Deducting this "external" factor from the total of 315,509, only about 300,000 "comparable" Rumanian Jews were left in April 1941.

Thus, whereas Core-Rumania lost 28,930 Jews during the interim ten years, or 9%, Greater Rumania's loss of Jews between December 1930 and mid-1940 totaled 91,430, or 12%. Furthermore, the areas ceded to Hungary, Bulgaria and the Soviet Union in the summer of 1940 recorded 428,000 Jews at the end of 1930 (148,660 in northern Transylvania, 846 in southern Dobrudja, and 278,494 in Bessarabia and northern Bukovina combined), but during the 1930s a decrease by 62,500, or 15% had occurred:

Jewish Population in Rumania

	December 1930	Before the war	Changes	
			number	(%)
Greater Rumania	756,930	665,500 (mid-1940)	–91,430	–12
Core-Rumania	–328,930	–300,000 (April 1941)	–28,930	–9
Ceded territories	428,000	365,500	–62,500	–15

This considerably smaller decline in Core-Rumania compared to the regions ceded in the summer of 1940 probably has two reasons: First, eastern Rumania contained many Jews who had fled from the Ukraine during the Russian civil war; but Bessarabia's agricultural economy was not devel-

⁸² Publikationsstelle Wien. *Die Bevölkerungszählung in Rumänien 1941 (Geheim)*, p. 23.

oped enough to absorb these people, and emigration, therefore, often was the only possibility to escape poverty.

Secondly, the beginning industrialization and the accompanying urbanization lured many rural Jews to migrate to the cities – and in Rumania there was only one with more than 100,000 inhabitants, namely, the capital of Bucharest. The total population of this city had grown from 639,040 (December 1930) to 999,658 (April 1941), *i.e.* by 56.4%. In the course of the general migration from the rural areas, the Jewish population of Bucharest increased as well, although not as rapidly as the Rumanian, because the Jews preferred emigration to a migration to the cities. Still, Bucharest's Jewish population rose by 14,788 from 76,480 (December 1930) to 91,268 (April 1941), that is, by 19.3%.⁸³ Obviously, the Jewish population of the area where the census was taken in April 1941 (Core-Rumania) would have declined much more than 9%, were it not for the internal migration from the regions to Bucharest and other larger central cities.

The admission of tens of thousands of Polish-Jewish refugees in September 1939 poses great difficulties in determining the Jewish population of the ceded territories precisely. To be sure, there is an official Rumanian estimate of 148,621 Jews for the ceded portion of Transylvania as of January 1, 1940,⁸⁴ compared to the census of 1930, which found 148,660, but it is completely unknown how many Jewish refugees from Polish Galicia were included in the 1940 estimate. Nevertheless, it appears that the Jewish population of Transylvania was stagnant during the previous decades already. The *Jüdisches Lexikon* (Jewish Encyclopedia), for instance, mentions that the censuses of 1910 and 1920 for Transylvania, the Transylvanian foreland and the Banat recorded 172,294 and 181,340 Jews, respectively⁸⁵ – an increase of only 9,000 during that decade, or one half of one per cent annually. But the *Jüdisches Lexikon* also says that there had been a large Jewish immigration from Galicia at the time. Without this immigration, Transylvania and the Banat obviously would not have registered any increase at all. For this reason, it is probable that Transylvania – like all the other regions of Rumania – recorded a decrease of its Jewish population until 1940. Even assuming a rate of decrease only half the Rumanian average – *i.e.* 6% – no more than 140,000 native Jews could have been living in northern Transylvania when it was ceded to Hungary. But the Rumanians insist that 148,621 Jews populated the area, and this figure agrees very well with a similar figure produced by the Hungarians for the Jews in their newly acquired territory.⁸⁶ The difference of 8,621 (148,621 minus 140,000)

⁸³ *Wirtschaft und Statistik*, 10/2/1941, p. 392.

⁸⁴ Publikationsstelle Wien. *Die Bevölkerungszählung in Rumänien 1941 (Geheim)*, p. 20.

⁸⁵ *Jüdisches Lexikon*, Berlin (Jüdischer Verlag), 1930, Vol. IV/2, S-Z, p. 650-651.

⁸⁶ Reitlinger, *Final Solution*, p. 497.

thus must consist of Jewish refugees from Polish Galicia of September 1939.

Given the above information, one can now determine the native Jewish population of the areas ceded to the Soviet Union:

	1930	1940	Changes	
			Number	(%)
All ceded territories	428,000	365,500	–62,500	–15
<i>deduct:</i>				
Northern Transylvania (excl. Polish-Jewish refugees)	–148,660	–140,000	–8,660	–6
Southern Dobrudja	–846	–412 ⁷⁸	–434	–51
Territories ceded to the USSR (excl. Polish-Jewish refugees)	278,494	225,088	–53,406	–19

A decrease by 53,406 Jews, or 19%, in the areas handed over to the Soviet Union is not particularly large, considering that the majority of those 278,494 Jews of 1930 lived in Bessarabia, a poorly developed region.

Yet, it appears the Soviets acquired many more Jews than those 225,088 when they occupied the Rumanian areas. In September 1939, Polish Jews fled *en masse* not only to the Soviet Union but also to Rumania. Reports on the number of refugee Jews in Rumania are very vague, however. An informative account, but unfortunately poor in statistics, of the flight of Galician Jews to Rumania is J.G. Burg's *Schuld und Schicksal*.

We assumed that at least 100,000 Polish Jews found their way to Rumania, because reports in the Zionist press – if true – make this number seem quite realistic. We found 9,000 Polish-Jewish refugees in northern Transylvania. Furthermore, up to 65,000 Jews – apparently consisting mostly of Polish-Jewish refugees – are said to have changed over to Soviet territory when the Soviet Union occupied northern Bukovina and Bessarabia in 1940.⁸⁷ These 65,000 Jews must have lived in southern Bukovina and Moldavia since their arrival from Poland, which is not improbable in view of the geographic proximity of Galicia. Many other Jewish refugees from Poland were living in the northern Bukovina and in Bessarabia when the Soviets annexed those areas. For these reasons, it is quite probable that more than 90,000 Polish refugee Jews fell under Soviet domination in the course of the Soviet occupation of large parts of Rumanian territory. Thus, it seems that the Soviets acquired a total Jewish population numbering 316,000 at the time of their acquisition of Bessarabia and northern Bukovina (225,000 native Jews plus 91,000 Polish-Jewish refugees).

But even after the outbreak of hostilities with the Soviet Union (June 22, 1941), there were still many possibilities for Jews to leave Rumania,

⁸⁷ *AJYB*, 1941, Vol. 43, p. 330.

often taking strange and risky routes. One escape route led from the port of Constanza to neutral Turkey: Many ships left this port under German protection at times – trying to reach extra-European destinations. In this connection, the tragic fate of the steamer *Struma* comes to mind; this ship had left Constanza for Istanbul on December 16, 1941, and was hit by British mines off the coast of Turkey; except for two saved, all of the 769 Jewish passengers died,⁸⁸ other ships met a similar fate.

Reitlinger referred to this route as follows:⁸⁹

[...] *it was possible to run a daily small steamer from Constanza to Istanbul* [...]

Even if one allows only 100 persons per trip, a minimum of 100,000 Jews must have left Europe during the war on this route. The composition of the passengers is not known. But since the Jewish population of Rumania still numbered more than 400,000 after “liberation” by the Red Army, it would appear that the majority of the Jewish refugees leaving Constanza by ship during the war must have been of Polish, Hungarian, Czech or Slovak nationality.

A second escape channel ran on land from Rumania through Bulgaria to Turkey and from there to Palestine, Persia or overseas. Reliable figures on the entire exodus by way of Rumanian ports and Bulgaria are not available. All we know is – this will be covered in greater detail in the next chapter – that tens of thousands of European Jews from all countries within the German sphere of influence escaped this way. The *Universal* commented:⁹⁰

[...] *during the Second World War [...] the State Department of the United States [helped] many Jews fleeing from Rumania to find a haven in Turkey and Palestine.*

Assessing the number of Rumanian Jews escaping this way between mid-1940 and the end of the war at only 20,000 is just to keep this exodus on record, because the actual number of Jewish refugees leaving Rumania during this period must have been much larger, probably many, many times larger.

A comparison of the Jewish population of April 1941 with the purported survivors at the end of the war allows no conclusions as to the extent of flight from Rumania during the war. In 1945, Rumania regained northern Transylvania. The areas annexed by the Soviet Union in 1940 and reconquered in 1941, however, were again occupied by the USSR. The post-war “estimates” thus refer to the Rumania within its post-war borders – an area which contained maybe 451,000 Jews in August 1939:

⁸⁸ Reitlinger, *Final Solution*, p. 405.

⁸⁹ *Ibid.*, p. 409.

⁹⁰ *Universal Jewish Encyclopedia*, Vol. 9, p. 265.

Jewish population in early 1938	692,244
Emigration from 1938 until mid-1939	app. –16,000
mid-1939 (borders of 1939)	676,244
Rumanian Jews in the areas ceded to the USSR	–225,088
Jewish population in mid-1939 (borders of 1945)	ca. 451,000 ⁹¹

The number of Jews found in northern Transylvania after the war is not known. Our calculations show that 21,000 were deported to Germany during the war, but according to Reitlinger 20,000 returned from German camps.⁹² On the other hand, it is probable that at least 10,000 died in the Hungarian military labor force, and the number of those who disappeared in Soviet prisoner-of-war camps – as in the case of the Hungarian Jews – is a total mystery. Reducing the original figure of 148,621 for Transylvania by those 1,000 failing to return from German camps and the 10,500 killed in action, the remainder of 137,000 probably is still too large; but this is the best one can do.

As for the “survivors,” Dr. Isaac Glickman, former member of the executive committee of the Federation of the Jewish Communities of Rumania, gave evidence before the investigating committee of the U.S. House of Representatives in 1954. Dr. Glickman says he left Rumania at the end of 1947. He estimated the number of Jews in Rumania at 425,000 at the “time of liberation.”⁹³ Mr. Hilberg, though, found 430,000 in post-war Rumania.⁹⁴

It is all but certain that the figure of 430,000 Jews in Rumania is too low by several tens of thousands. If Dr. Glickman put the number of Jews in Rumania *at* the “time of liberation” at 425,000, this must be a low figure. After all, Reitlinger mentioned 20,000 who returned from German camps after the war, *i.e. after* the “time of liberation,” and further thousands are supposed to have returned from the USSR *after* the war. All of this adds up to far more than 450,000 – at least 20,000 more than Hilberg claims to have found.

Following our own cautious calculations, we should have found 433,000 Jews (or even less, because we had no clues as to the number of former members of the Hungarian military labor force who did not return from Soviet prisons, and our imputed figure of only 20,000 emigrants between 1941 and the end of the war is probably only a fraction of the real number). In other words, when war drew to a close in Rumania, tens of

⁹¹ Millman, Ivor, “Romanian Jewry: a Note on the 1966 Census,” *Soviet Jewish Affairs*, No. 3, May 1972, p. 105; this Jewish author asserts that the Communist census authorities of post-war Romania put the size of the Jewish population within today’s borders at 452,000 for the time of the 1930 census. If this estimate were correct, our figure of 451,000 Romanian Jews in 1939 (in today’s borders) would be too large by at least 20,000!

⁹² Reitlinger, *Final Solution*, p. 497.

⁹³ *Treatment of Jews by the Soviet*, p. 53.

⁹⁴ Hilberg, *Destruction of European Jews*, p. 737.

thousands of Jews were living in that country who had arrived there *during* the war. And, indeed, there is a report by the International Red Cross published in 1948 about its activities during the war, saying that after the retreat of the Germans 6,000 Hungarian Jews had been found in northern Transylvania in December 1944. This obviously vast immigration of non-Rumanian Jews during the war is another indication that Rumania was a real gateway for untold numbers of European Jews to leave Europe by water and by land. Statistically the development looks like this:

Jewish population in early 1938	692,244	
Emigration from 1938 until mid-1939	–16,000	
mid-1939	<u>676,244</u>	
Admission of Polish-Jewish refugees (1939)	100,000	
September 1939	<u>776,244</u>	
<i>deduct:</i>		
Taken over by the Soviet Union:		
– Polish-Jewish refugees	91,000	
– Native Rumanian Jews	<u>225,088</u>	
	316,088	
Acquired by Hungary	148,621	
Acquired by Bulgaria	412	
Emigration 1940	<u>10,700</u>	–475,821
		300,423
Persons considered Jewish according to the changed census definitions of 1941 (est.)		<u>+15,086</u>
Jewish population – census of April 6, 1941		315,509
Emigration: April 1941– end of war		<u>–20,000</u>
Jews in Core-Rumania at end of war (maximum)		295,509
<i>add back on:</i>		
Recovery of Transylvania	148,621	
Recovery of southern Dobrudja	<u>412</u>	
	149,033	
<i>deduct:</i>

Jews failing to return from German camps	<u>–1,000</u>	+137,533
Calculated number of Jews in post-war Rumania		ca. 433,000
Purported “survivors” according to Hilberg		<u>–430,000</u>
“Missing” Jews		ca. 3,000

Bulgaria

The census of 1934 recorded 48,398 Jews.⁹⁵ In 1947(!), their number had been reduced to 46,500 according to the *Year Book*.⁹⁶ The difference of

⁹⁵ *AJYB*, 1941, Vol. 43, p. 668.

1,898 must be attributed to emigration and/or an excess of deaths over births, because not a single Jew was deported from Bulgaria during the war.⁹⁷

We will show in the next Chapter that 48,642 Jews emigrated to Israel from Bulgaria between May 15, 1948, and December 31, 1970. The number of Bulgarian Jews who might have left their country during or immediately after the war is completely unknown. But Bulgaria, too, belonged to those countries where large-scale emigration was easiest after the war according to Zionist scholar Hilberg. It is thus not far-fetched to assume that thousands (or tens of thousands?) made use of this possibility *before* 1947 in order to emigrate to Palestine and overseas. Also, there is no reason to believe that *all* of the Bulgarian Jews had left for *Israel* after May 15, 1948.

In 1970, there were still 7,000 Jews in Bulgaria.⁹⁸ Since Bulgarian Jews were not known for their great fertility, it becomes quite obvious that Bulgaria's Jews did not number 46,500 at the end of the war, as Zionists want us to believe, but many thousands, even tens of thousands more. In any case, 56,000 (48,642 plus 7,000) is a minimum figure. This is another piece of evidence that Bulgaria – just like Rumania – was a transit country during the war for Jewish refugees from Yugoslavia, Hungary, Rumania, Slovakia and Poland! More than that, these contradictory figures show the relative magnitude of understatement contained in the “survivor”-figures as published by Zionist sources.

Jewish population (1934)	48,400
“Survivors” (1947)	56,000
“Immigrants”	7,600

Summary

At the beginning of the 1930s, all the European countries (excl. the USSR and the Baltic countries) which later fell within the German sphere of influence contained about 6 million Jews (*Table 11*). Anti-Jewish measures and economic misery resulted in a massive emigration of over 1.1 million Jews from just five countries – Poland, Germany, Czechoslovakia, Hungary and Rumania (see also First Chapter). The largest part of this emigration was directed toward Palestine and overseas (more about that in the next chapter) and, to a smaller degree, to western Europe. Other unfavorable developments (negative population growth in Germany and Hungary, con-

⁹⁶ *Ibid.*, 1947, Vol. 49, p. 740.

⁹⁷ Reitlinger, *Final Solution*, p. 379.

⁹⁸ *AJYB*, 1971, Vol. 72, p. 476.

versions in Hungary) more than compensated for the relatively meager excess of births in other parts of Europe – if there was any at all. At the outbreak of the German-Polish war (end of 1939), the Jewish population in these European countries had dropped to about 5 million.

The *Year Book* committed a serious error when it placed the number of Jews in these countries at 6 million for the year 1939.⁹⁹ A comparison would show that the *Year Book* did account for emigration from Germany and Hungary (in part, at least), but not for that from Poland, Rumania and Czechoslovakia. To the contrary, the Jewish populations of these latter three countries were “increased” by assuming unrealistically high birth rates. The result is grave. In actual fact, Poland, Rumania and Czechoslovakia contained only 3.6 million Jewish inhabitants at the end of 1939, but the *Year Book* insists on 4.5 million! Since there were 956,000 fewer Jews in the area of the subsequent German sphere of influence in 1939 (*Table 11*), 90% of this difference must be attributed to just those three countries. In other words, here we have almost one million Jews who were not even in Europe at the start of WWII, but who are nevertheless included in the “Final Solution” according to the Zionist statistical method.

However, in 1941 – just prior to the German invasion of the USSR – only 2.8 million Jews lived within the German sphere of influence. The decrease by 2.2 million was largely the result of the annexation of large parts of Rumanian and Polish territory by the Soviet Union in 1939 and 1940, when those regions’ numerous Jewish populations together with many hundreds of thousands of Jews fleeing before the German armies disappeared into the Soviet empire. It is well known today that the Soviets succeeded in keeping the vast majority of their Jews outside the reach of German military power – for reasons of self-interest. Therefore, it is simply misleading to calculate the number of “missing” Jews by deducting the “survivors” after WWII – in most cases figures are available only for 1946 and 1947(!) – from 1939-figures which, to make it worse, are exaggerated by 1 million. There have been many changes between 1939 and 1945 due to emigration, low birth rates, conversions, deaths in combat, evacuation etc. Also, Poland and Rumania had suffered large losses of territory and population to the Soviet Union.

Our investigation in the Second and Sixth Chapters found 1,443,000 “surviving” Jews compared to 1,410,000 of the *Year Book* (*Table 11*). These “survivors” should be compared with the Jewish population in the European countries in 1941, taking into account the many changes which occurred in those countries during the war. On this basis, we arrived at a “missing”-figure of 1,269,000. This number is about 3.3 million smaller than that of the *Year Book*. The reason is clear: The *Year Book*’s pre-war

Sources

(a) With the exception of Germany and Austria, all figures in this column have been taken from *Table 16* (Eighth Chapter). Germany (incl. Danzig, Memel and the Saar) had 539,265 Jews in 1933, and Austria’s census found 191,781 Jews according to the *AJYB*, 1940, Vol. 42, p. 600.

(b) With the exception of the lines “Poland” and “*AJYB*-figures,” all of the figures listed in this column have been taken from the country-specific details in the Sixth Chapter.

(c) See First and Second Chapter.

(d) *AJYB*, 1947, Vol. 49, p. 740.

figure is too large by almost one million, and did not take into account the Soviet net acquisition of 2.1 million Rumanian, Polish, Hungarian and Ruthenian Jews. Just these two “mistakes” added up to an exaggeration of about 3.0 million “missing” Jews.

Let us summarize: In 1941, 2,847,000 Jews lived within the German sphere of influence in Europe (excl. the USSR and the Baltic countries). After allowing for war losses, those missing in Soviet prisons, emigration

and very low birth rates during the war, annexation of Ruthenia by the USSR in 1945, and the return of Polish-Jewish refugees from the USSR after the war, 2,712,000 (1,443,000 plus 1,269,000) Jews should have been counted in those countries after the war. On the basis of Zionist statistics – which refer to a large extent to 1946 and 1947, not to 1945 – we arrived at only 1,443,000 “survivors.” A similarly large number of Jews, namely 1,269,000, is not accounted for.

SEVENTH CHAPTER:

Jewish Emigration after World War Two

Following the defeat of Germany, a flood of non-German refugees poured from the East into the three Western zones of the occupied and divided country. Among them were many Jews. British General Sir Frederick Morgan, head of the UNRRA operations in Germany, declared in a press conference in Frankfurt/Main at the end of 1945 that an unknown Jewish organization was bringing masses of Jews from the East to Germany and that all of them were well fed and well dressed. The Zionist Hilberg, too, commented:¹

In Poland, Czechoslovakia, and Hungary many Jews chose not to wait; they decided to embark on their journey. [...] From Poland the exodus began through Czechoslovakia to the American zone in Germany. From Hungary and even Rumania the Jews began to arrive in Austria. By November 1945, the flow was beginning to thicken, and thousands of refugees were spilling over into Italy.

In this connection, one should always keep in mind that the statistics on Jewish “survivors” do not pertain to May 8, 1945, but to the years 1946 and 1947. The 1.4 million “survivors” thus cannot possibly include this huge number of refugees leaving their native countries in eastern Europe.

Immediately after the war, more than 250,000 Jews inhabited the DP-camps in Germany, and in July 1947 more than 400,000 refugee Jews are said to have remained in western Europe.² These figures apply only to certain fixed points in time, because in the interim periods hundreds of thousands of Jews left Europe in the direction of Palestine, North and South America and other places!

These uncontrolled arrivals and departures in the chaotic post-war period prevented an official count of the wandering, fleeing and uprooted Jews. The only possibility to obtain a somewhat reliable picture of this mass migration is to determine the post-war Jewish *immigration* in the main countries of destination.

¹ Hilberg, *Destruction of European Jews*, p. 729-730.

² Butz, *Hoax of the Twentieth Century*, p. 232.

United States

Official U.S. statistics put the number of Jews in 1926 at 4,081,242; another official count in 1936 found 4,641,184.³ Both figures refer only to communities with synagogues. As Special Agent of the United States Bureau of the Census, Dr. Harry S. Linfield made a study of all the communities without synagogues and found that 4,228,029 Jews lived in the United States at the end of 1927.⁴ A similar investigation by Dr. Linfield in the same capacity produced 4,770,647 Jews for 1937.⁵

It is not certain to what extent immigration and natural growth contributed to the population increase of 543,000 in the ten-year interval. In the previous decades millions of Jews had entered the United States: About 1.8 million between 1899 and 1924. At least three-fourths of them originated in Poland and Russia, countries with a very fertile Jewish population in those days. A large portion of the other fourth, too, hailed from countries such as Rumania, whose Jewish population had shown large natural growth rates.⁶ But the changes in the U.S. immigration laws in the 1920s are supposed to have led to a drastic reduction in the flow of Jewish immigration from eastern Europe.

Besides, the new urban American environment soon began to show up in sharply dropping birth rates. It is thus quite reasonable to assume that the annual natural increase of American Jews amounted to 0.5% at most between 1927 and 1937. Even this rate seems somewhat high, particularly in view of the 0.8% net growth rate of the total U.S. population – with its large and fertile colored and white rural sections between 1930 and 1939.⁷ It would seem that an excess of births over deaths could have increased the U.S. Jewish population from 4,228,029 in 1927 to at most 4,444,000 in 1937. In actual fact, however, 4.77 million Jews were found in 1937 – 326,000 more than natural growth would have warranted. A check of U.S. immigration statistics reveals, though, that only 81,212 Jewish immigrants were recorded in this period.⁸ An explanation for this wide discrepancy will be forthcoming below.

The *Year Book*'s post-war Jewish population statistics for the U.S. are as follows:

³ *The Immigration and Naturalization Systems of the United States*, Report of the Committee on the Judiciary, U.S. Senate, 81st Congress, 2nd Session, April 20, 1950, p. 843.

⁴ *AJYB*, 1976, Vol. 77, p. 268

⁵ *Ibid.*, p. 271-274.

⁶ *The Immigration and Naturalization Systems*, p. 21.

⁷ U.S. Department of Commerce, Bureau of the Census. *Population Estimates and Projections*, Current Population Reports, Series P-25, No. 632, July 1976, Washington, D.C., p. 1.

⁸ *AJYB*, 1947, Vol. 49, p. 749.

1946 until 1956	5,000,000
1957 and 1958	5,197,000
1959	5,367,000
1960 until 1967	5,532,000
1968 until 1970	5,869,000
1971	6,060,000

These figures are fictitious. The purported population size for 1946 was simply maintained without change for ten years, at a time when hundreds of thousands of central and Eastern European Jews found shelter in the United States. Finally, when it was decided to proceed with the long overdue correction, the increase by just 197,000 was barely enough to explain the net natural growth between 1946 and 1957. Obviously, these figures are politically inspired.

Already in 1943, the Jewish historian and former secretary of the Hilfsverein der Deutschen Juden (Relief Association of German Jews), Dr. Mark Wischnitzer, who was employed by the American Jewish Joint Distribution Committee since 1938 and figured prominently in the edition of the *Universal Jewish Encyclopedia*,⁹ wrote in an article in *The Jewish Quarterly Review* that the Jewish population of the United States had reached 5,199,200.¹⁰ The rise by 429,000 from 4.77 million since 1937 amounts to an annual growth of 1.45% (!) – much too large for any possible natural increase. The answer to this contradiction was provided by Assistant Secretary of State Breckinridge Long.

In March 1943, Long declared in the name of the U.S. Government that 547,775 refugees had entered the United States since 1933.¹¹ Eight months later, on November 26, Long testified before an investigating committee of the U.S. House of Representatives, the House Foreign Affairs Committee:¹²

The United States has admitted about 580,000 victims of persecution by the Hitler regime since it began ten years ago. [...] the majority of the refugees admitted were Jews [...]

It is not known what was meant by the term “majority.” If he meant at least 70%, 406,000 of the 580,000 victims of persecution accepted by the United States must have been Jews. Unfortunately, the official immigration statistics show only 163,583 immigrant Jews between 1933 and 1943, which is

⁹ *Encyclopaedia Judaica*, Vol. 16, p. 554-555.

¹¹ Sykes, Christopher. *Kreuzwege nach Israel. Die Vorgeschichte des Jüdischen Staates*, Munich, 1967, p. 414.

¹² *The New York Times*. “580,000 Refugees Admitted to United States in Decade,” 12/11/1943, p. 1; see also footnote no. 11.

about 240,000 fewer.¹³ The explanation for this further discrepancy is very simple.

First, the Jewish statistician Arthur Ruppin pointed out that U.S. immigration statistics for Jews do not mean very much; the reason is that they do not include those Jewish immigrants whose culture and ordinary language makes them appear as members of the people of their country of origin. The Jewish immigrants from Germany, for example, were not registered as “Hebrews” but as Germans, whereas Galician Jews from Poland often appeared very “Jewish” because of their everyday language, looks, etc., and thus were registered in the column for “Hebrews.”¹⁴

Secondly, Long told the investigating committee that the United States allowed Jews to enter the United States on *visitors’* visas before and during the war. This is of course another very important reason for the fact that US immigration statistics show only 165,583 Jewish immigrants between 1933 and 1943 instead of more than 400,000.¹⁵

One way to arrive at the real number of Jewish immigrants before and after 1937 may be – despite unavoidable inaccuracies – to divide those estimated 406,000 immigrant Jews on the basis of the registered Jewish immigrants between 1933 and 1943:

Jewish Immigrants in the United States: 1933-1943

Period	Registered	Calculated
1933-1937	27,374	67,000
1938-1943	138,209	339,000
1933-1943	165,583	406,000

Adding the calculated Jewish immigrants numbering 339,000 between 1938 and 1943 to the 4,771,000 Jews of 1937, one obtains a total of 5.11 million, or 89,000 fewer than mentioned by Dr. Wischnitzer for the year 1943. This difference is equivalent to a natural growth rate of about 0.3% p.a. – possibly somewhat low, but still quite plausible for an urban population whose birth rate was negatively affected by economic need during the Great Depression (1937-1940) and men absent on military duty (1941 to 1943).

According to the *Year Book*, however, the American Jewish population reached only 5,197,000 in 1957. This figure is still smaller than found in 1943 by Dr. Wischnitzer, who was in an excellent position to judge the actual size of Jewish immigration. Meanwhile, though, further hundreds of thousands of homeless European Jews entered the United States since 1943. Also, it is a matter of statistical record that the Jewish population,

¹³ *AJYB*, 1947, Vol. 49, p. 749.

¹⁵ *The New York Times*. “580,000 Refugees Admitted to United States in Decade,” 12/11/1943, p. 6.

too, was affected by the baby-boom following WWII, although for a much shorter time period. The figure produced by the *Year Book* for 1946, therefore, is just plain *wrong*.

In 1970, the Council of Jewish Federations and Welfare Funds sponsored a nationwide sampling survey of the Jewish population, the so-called National Jewish Population Study (NJPS). The survey did not aim at tracing all American Jews but only those who were still connected with Jewry in any form whatsoever.¹⁶ Jews who had broken completely with their Jewish past and retained no further ties to their Jewish identity were not included. We shall attempt to obtain some answers from this study to questions regarding immigration, natural growth and assimilation.

NJPS found 5,731,685 persons in Jewish households – defined as households with at least one Jewish person; among these there were 5,370,000 Jews. If this number would have included all the Jews in the U.S., the increase over 27 years earlier would have been only 171,000! An analysis of the age structure (*Table 12*) proves that such a tiny growth is totally impossible.

Table 12: Age Structure of American Jews: 1970

Year of Birth	Age	Share in %	Share per Year of Birth (%)
1966–1970	0– 4	5.7	1.14
1961–1965	5– 9	6.7	1.34
1956–1960	10–14	10.1	2.02

Source: *AJYB*, 1973, Vol. 74, S. 271.

It is evident that the incidence of births was not very great from 1941 to 1945, but between 1946 and 1960 it was considerable; after that it fell rap-

¹⁶ *AJYB*, 1974, Vol. 75, p. 300, and 1977, Vol. 78, p. 262-263.

idly. The table points to a net growth rate between 1946 and 1960 of possibly around 0.8% per year. The decade of 1961-1970 saw a drastic reduction in the number of births. It may be assumed that the rate of natural increase fell to as low as 0.2% p.a. on average.¹⁷ Given these growth rates, the Jewish population would have had to pass the 6-million-mark by 1970 even without the post-war immigration flows.

The absolute impossibility of just 5.37 million American Jews in 1970 was supported by other information made available by the NJPS. The study noted that 8.6% of all heads of households aged 20 to 24 years—born 1946 to 1950—were foreign-born.¹⁸ There is no reason to assume that the heads of households showed very different characteristics from the rest of the Jewish population; thus, we can apply that rate to the entire Jewish population as well.

While there is no information on the percentage of those born abroad in the years 1946-1950 among the post-war Jewish migrants to the United States, the population statistics of the immigrant nation of Israel provide a rather good indication of the relative number of Jewish immigrants born in Europe during the first few post-war years.

As of December 31, 1954, there were 37,279 Jews in Israel born in Europe¹⁹ between 1945 and 1949 (age 5-9 years).²⁰ From 1945 until May 15, 1948, a total of 73,282 Jews entered Israel, 90%, or roughly 67,000, of them from Europe.²¹ Between May 15, 1948, and December 31, 1954, another 346,000 Jews arrived from there.²² The total number of immigrants from Europe may have reached 413,000 between 1945 and 1954, about nine-tenths of them in the years 1945-1950. A relatively small number either returned or moved on to America, Australia, etc. Of all the Jews entering Israel between May 15, 1948, and the end of 1955, 7% are supposed to have left again.²³ The extent to which these emigrants consisted of European, North African or Middle Eastern Jews is not known. Applied to the 413,000 European Jews who emigrated between 1945 and 1954, one may

¹⁷ It must be assumed that the Jewish natural rate of increase fell below zero in the USA in the 1970s. The *AJYB*, 1976, Vol. 77, p. 310 wrote for instance: "[...] the current Jewish fertility is 6 points below the rate that prevails in even the most intensely urbanized areas." The urban population, especially in the large cities, in the United States like in all industrial countries recorded natural increases far below that of the general population. But if, as the publication "Population Estimates and Projections" of the U.S. Department of Commerce notes, the average American net growth rate was below 0.6% after 1972, the logical conclusion must be that the American-Jewish population is confronted with a serious demographic crisis since the early 1970s.

¹⁸ *AJYB*, 1973, Vol. 74, p. 276.

¹⁹ *The Statistical Abstract of Israel* does not list the immigrant Jews from America and Europe separately; but the Jewish immigrants from America represent only a tiny fraction of this group.

²⁰ *Statistical Abstract of Israel 1955/56*, Table 16, p. 14.

²¹ *Ibid.*, 1980, Table V/1, p. 133.

²² *Ibid.*, 1954/55, Table 5, p. 33.

²³ *Ibid.*, 1955/56, Table 3, p. 7.

argue that the net immigration from Europe between 1945 and 1954 amounted to only 384,000 (93% of 413,000).

Evidently, the age groups 1945 to 1949 amounted to only 9.7% (37,279 of 384,000) of the European Jews who immigrated in Israel between 1945 and 1954. There is no reason to suppose the Jewish immigrants in the United States displayed a radically different age structure – after all, they too came from Europe. The implications for the American Jews are as follows:

1. The age group “20-24 years” in the *purported* Jewish population of 5.37 million amounted to 8.7% according to *Table 12*; in numbers, 467,000.
2. Of these, 8.6% or about 40,000 were born abroad in the years 1946-1950.
3. These 40,000 immigrant Jews born abroad in the years 1946-1950 constituted 10% of all immigrants; thus, total immigration must have numbered about 400,000!

Using the age structure as provided by NJPS, and the natural growth rate which may be estimated from it, the total natural increase must have been around 700,000 between 1946 and 1970. Deducting these excess births and immigration from the 5.37 million (1970), one should obtain the level of the Jewish population in the United States at the end of the war: Not surprisingly, the remainder of 4.27 million is even half a million *below* the semi-official figure of 1937!

The conclusion to be drawn from this exercise is *not* that the data gathered by NJPS are worthless. They are probably quite correct. The problem is that the NJPS-study was only concerned with those Jews with continuing ties to the Jewish community; the assimilated Jews remained outside the study. In effect, the study shows the magnitude of the losses suffered by American Jews during the past decades through assimilation!

But just how large was the Jewish population in the United States really in 1970? Publishing the Zionist population figures for the United States in 1957, the *World Almanac and Book of Facts* apparently believed them to be far too anachronistic. To be sure, the *Almanac* cited the “official” Zionist figure of just 5.2 million but added that “an independent study places the percentage [of Jews] at 3.69%, and the possible number of Jews in the United States at 6,290,000.”²⁴

Starting from these 6.29 million (1957) and projecting them until 1970 on the basis of the growth rates implicit in *Table 12*, one obtains 6.6 million. This figure includes, of course, the assimilated Jews as well. If the latter did not exhibit drastically different characteristics, which is not likely, 8.7% of them were also born in the years 1946-1950, and 8.6% of these, in turn, were foreign-born. The relationship of this age group to all of the

²⁴ 1958 *World Almanac and Book of Facts*, New York, p. 270.

Jews immigrating after the war also must have been 1 to 10. The resulting alternative development looks like this:

Jewish population in the United States – 1970	6,600,000
<i>deduct:</i>	
– Natural increase 1946-1970 ²⁵	865,000
– Post-war immigration until 1970 ²⁶	490,000
Total demographic changes after the war	–1,355,000
<u>Jewish population in the United States – 1945</u>	<u>5,245,000</u>

This calculated 1945-figure is just barely above the one mentioned by Dr. Wischnitzer for the Jewish population of the United States in 1943. If one deducts, furthermore, the semi-official figure of 4.77 million for 1937, it becomes apparent that Long's testimony regarding the immigration of hundreds of thousands of Jews until 1943 fits neatly into the difference.

The composition of the Jewish population in the United States by age and origin – as published by NJPS – provides the following conclusive results:

- A. In 1945, 5.25 million Jews inhabited the United States.
- B. Their number increased to 6.6 million by 1970.
- C. About 0.5 million Jews entered the United States *between 1945 and 1970*.

At the same time, NJPS admitted unintentionally that 1¼ million Jews, or one Jew in five, renounced their Jewish identity:

Actual Jewish population 1970	6,600,000
Jews found by NJPS 1970	5,370,000
<u>Assimilated Jews 1970</u>	<u>1,230,000</u>

Such a high assimilation rate among Jews in the United States cannot surprise. Today, more than 40% of all U.S. Jews marry gentiles – four times as many as just a few decades ago. Only one third of these mixed couples raise their children in the Jewish tradition. In a study on “Intermarriage and the Jewish Future,” the American Jewish Committee complained that the United States' Jewish population would drop below one million within fifty years unless these losses can be stopped.²⁷

²⁵ The excess of births over deaths numbering 865,000 for the years 1946-1970 was calculated on the basis of the age structure as published by NJPS.

²⁶ The immigration of 490,000 for the years 1946-1970 was computed as follows:

a) The Jewish population born in 1946-1950 is 8.7% of 6,600,000, or 574,000.

b) Of these 574,000 8.6%, or 49,000 were born abroad.

c) These 49,000 represent about 10% of the immigrants.

²⁷ *U.S. News & World Report*, New York, April 7, 1980, p. 41.

Israel

The census of 1931 found 174,610 Jews in Palestine; by 1944, their number increased to 553,600,²⁸ and to 649,600 on May 15, 1948.²⁹ Officially, Jewish immigration – most of the immigrants came from Europe at the time – numbered 292,779 between 1932 and 1944, and 73,282 between 1945 and May 15, 1948.³⁰ But these statistics are not as reliable as they seem. They represent only gross numbers, because comparable emigration figures appear not to exist for Palestine. Also, it is questionable whether the authorities really succeeded in keeping statistics on the considerable number of illegal immigrants. It is possible that emigration and illegal immigration cancelled each other; but it seems that the remaining difference, implying a natural increase of about 2% p.a., is too high even for the young Jewish immigrant population of those days.

Between May 15, 1948, and December 31, 1970, another 1.4 million Jews entered the country, mainly from Europe, Africa and the Middle East.³¹ The immigration figures by countries of origin shown in *Table 13* should not be taken at face value. Ostensibly, Israeli immigration statistics are kept on the basis of the country of origin. But there is good reason for doubt, as the following examples indicate.

It can be shown that among the 60,581 Jews from Persia, there were few Persian Jews; almost certainly, most of them originated from eastern Europe or the Balkans. Another explanation is impossible: Before the war, Iran's Jewish population numbered 40,000;³² by 1970, 60,581 Jews had left Persia for Israel, and yet, in 1971, there were still 80,000 Jews in Persia.³³ A natural increase of this size is unthinkable, leaving only one logical conclusion: They must have entered Persia between 1939 and the end of the war, coming from eastern Europe and the Balkans. The Soviet Union, Great Britain and the United States violated Iran's proclaimed neutrality by force of arms and occupied that country against its will in World War Two. Persia was powerless to stop the immigration of Jews who had escaped from the German sphere of influence but whom no country wanted to accept.

In theory, two roads existed for the fleeing Jews to reach Iran: One was by way of the Soviet Union, and may have been used by a few Polish and Rumanian Jews – provided the Soviets allowed it. The second, more important route, led from Rumania through Bulgaria and neutral Turkey to the Anglo-Saxon occupied part of Persia. Now, if Israel alone obtained

60,000 non-Iranian Jews from Persia, it would be only logical to assume that many other tens of thousands migrated to other countries and continents as well, for instance, to North and South America. The exact number is of no great importance, although it would be helpful, because if Iran accepted that many Jewish refugees during the war from eastern Europe, the bridge from the Balkans across Turkey must have been used by more than one hundred thousand, possibly even two hundred thousand refugee Jews. One should keep in mind that the official immigration in Palestine between 1940 and 1944 amounted to 45,066,³⁴ and to this must be added the many thousands of “illegal” entries. Almost all of these immigrants had come from eastern Europe and the Balkans.

The census of 1936 listed 161,312 Jews in French-Morocco.³⁵ The high fertility of these Jews was offset, however, by a very high infant mortality rate, meaning that their natural increase was not all that different from that in other Oriental countries. In the early 1930s, the excess of births of Oriental Jews amounted to 5,000 according to the *Universal*.³⁶ Applied to a total Jewish population in Africa of perhaps 550,000, this excess is equivalent to a net growth rate of 0.9% p.a. For the period 1939-1945 the *Year Book* suggests an increase of the African Jews (excl. South Africa and Rhodesia) by 27,000 or 4,500 annually. This, too, would correspond to a net growth rate of 0.9% for an African-Jewish population (again excl. South Africa and Rhodesia), averaging barely more than 500,000.³⁷ Given a natural increase of, let us say, 1% p.a., Morocco's Jewish population could have increased to reach at most 200,000 by the early 1950s, when most of the Jews left the country. Almost 50,000 Moroccan Jews (1971: 48,000),³⁸ however, decided to stay.

In other words, the total number of Jews who could possibly have left Morocco for Israel was 150,000 – provided that *all* of them decided to go to Israel. Israeli immigration statistics, however, list more than 250,000 immigrant Jews from Morocco. The only explanation is that Morocco, a French protectorate during and after the war, was an intermediate station for Jewish refugees from devastated Europe. Western Europe's resident Jews certainly saw little reason to move into Moroccan DP-camps after the war, and those 100,000 “surplus” Jews in Morocco, therefore, can only have originated in eastern Europe, or they consisted of western European Jews who returned from German deportation camps and who were neither willing nor capable of adjusting to a new life in their native countries.³⁹

We can observe a similar development in Tunisia. The 1936 census registered 59,485 Jews,⁴⁰ but in 1950, 105,000 Jews inhabited the country,⁴¹ and 13,000 had left Tunisia meanwhile for Israel (*Table 13*). Even conceding a

natural increase of 1%, as in the case of the Moroccan Jews, Tunisia's Jewish population could not have grown to more than 73,000 by the mid-1950s, when the majority of the Jews left the country. Obviously, Tunisia, too, had "surplus" Jews numbering 45,000 (105,000 plus 13,000 minus 73,000). 10,000 were still living in Tunisia in 1971, about 46,000 had left for Israel, and the largest part of the rest of the remaining 60,000 had moved on to France.

Without question, other countries in the Middle East and North Africa also gave shelter to refugee Jews, most of whom left for Israel after May 15, 1948, but never appeared as European Jews in Israeli statistics.

All of the western European countries were affected by the Jewish drama. But it was the uprooted Jews looking for a new beginning who constituted the bulk of the immigrants in Israel. Almost certainly, the 75,037 Jews who immigrated from western Europe either were eastern European in origin or else they belonged to those Jews returning from deportation camps. It is quite unlikely that western European Jews who survived the war in their home countries would have departed in large numbers for Israel.

The 75,372 immigrants from the Americas also provide some food for thought. A resident population does not migrate abroad very eagerly. All of the listed American countries were prime destinations for Jewish immigrants before, during and after the war. It is probable that the majority of these Jews also hailed from eastern Europe; but there is no direct evidence.

The following summary of the immigrant European Jews in Israel after May 15, 1948, represents a minimum number:

(Eastern) European Jews from Tunisia	45,000 ⁴²
(Eastern) European Jews from Persia	60,581
(Eastern) European Jews from Morocco	100,000
(Eastern) European Jews from western Europe	75,037
Jews from eastern Europe (excl. the USSR)	487,326
<u>Immigration of European Jews 1948-1970</u>	<u>767,944</u>

Not all of the 1.4 million immigrants between 1948 and 1970 remained in Israel. For the same period, the *Statistical Abstract of Israel 1971* listed a net immigration figure of 1,155,100.⁴³ This means that 244,000, or every sixth immigrant, left the country; it is not known how many of them were of European origin. But since the European Jews were considerably better educated than the Jews from North Africa and the Middle East and also had, in many cases, close ties of kinship to Jews in other Western countries, it is probable that the majority of the emigrants, let us say 75%, were

⁴² It is not known whether the Jews coming to Israel from Tunisia belonged to the Oriental or to the immigrated (eastern) European part. We assumed them to belong to the European Jews; consequently, the Jews migrating to France from Tunisia were grouped among the Orientals.

⁴³ *Statistical Abstract of Israel 1971*, Table B/2, p. 22.

of European origin, *i.e.* 183,000 of 244,000. On balance, the net, number of European Jews immigrated in Israel between 1948 and 1970 must have numbered 585,000 (768,000 minus 183,000).

Latin America and the Anglo-Saxon Countries

The other countries serving as main immigration countries besides the United States, Israel and France, which will be covered subsequently, are listed below:⁴⁴

	<i>Jewish Population</i>		
	Pre-war	1943	Post-war
Argentina	260,000 ('35)	350,000	500,000 ('70)
Brazil	40,000 ('33)	110,750	150,000 ('70)
Chile	3,697 ('30)	25,000	40,000 ('50)
Colombia	2,045 ('35)	5,800	10,000 ('70)
Mexico	20,000 ('35)	20,000	35,000 ('70)
Peru	1,500 ('35)	2,150	5,300 ('70)
Uruguay	12,000 ('30)	37,000	50,000 ('70)
Venezuela	882 ('26)	1,600	12,000 ('70)
Latin America	340,124	552,300	802,300
Canada	155,614 ('31)	170,241 ('41)	296,945 ('71)
Australia	23,553 ('33)	32,500	72,000 ('70)
South Africa	90,662 ('36)	99,000	119,900 ('70)
England ⁴⁵	300,000 ('31)	365,000	450,000 ('50)
Anglo-Saxon countries	569,829	666,741	938,845
Total	909,953	1,219,041	1,741,145

Until 1943, Latin America's Jewish population of 340,000 had increased by 210,000. Of this total, no more than 30,000 may be attributed to a natural increase, and the remainder of 180,000 thus represents Jewish immigration. In the post-war period, the Jewish population increased to over 800,000 – an addition of 250,000. Since Latin America's Jews are mostly

⁴⁴ Tartakower, Arieh and Kurt R. Grossmann. *The Jewish Refugee*, New York, 1944, p. 343; also, *AJYB*, 1944, Vol. 46 (p. 500-501); 1951, Vol. 52 (p. 196-198); and 1971, Vol. 72 (p. 477-479).

⁴⁵ According to *AJYB*, 1969, Vol. 70, p. 276, the estimated number of Jews in Great Britain rose to 450,000 in 1950 "and has stood at this figure ever since." In the issue of 1977, Vol. 78, p. 339-340, the *AJYB* wrote again:

An outstanding feature [of British Jews] is a demographic decline. [...] demographers forecast that, in the foreseeable future, the Jewish population may fall to 225,000 compared with the 410,000 currently [in 1971] estimated. The primary cause is the low birth rate. [...] Jewish families [showed] only an average of 1.72 children per family [compared] to the general population, which had an average of 2.16 children. [...] intermarriage unmistakably emerges as the greatest single threat to the future of British Jewry. [...] the true level of assimilation [...] is approximately 20 per cent [...]"

The reduction since 1950 thus may be explained by both of these factors intermarriage and too few births.

urban dwellers, especially in Argentina and Brazil, it is quite improbable that the excess of births over deaths even reached 100,000; this means that at least 150,000 must be due to immigration.

In the case of the Anglo-Saxon countries, excl. the United States, there was an increase of 97,000 until 1943. In all four countries, however, the Jewish population was rather infertile. Between 1933 and 1943, the following immigration occurred:⁴⁶

Canada	8,000
Australia	9,000
South Africa	8,000
England	65,000
<u>Total</u>	<u>90,000</u>

In other words, the natural increase cannot have been larger than 7,000. After the war, the Jewish population rose by 272,000. Because of the relatively low birth rate and, in the case of England because of the short time interval, immigration must have been at least 250,000.

France

France is a special case in the group of the main immigration countries for Jews. It was the only country occupied by Germany during the war, and after the war it not only recorded a huge immigration from eastern Europe, but from North Africa as well. As mentioned in the Sixth Chapter, only 238,000 Jews are supposed to have survived the war in France. In 1970, it is claimed 550,000 Jews were living there.⁴⁷ Up to 60,000 Jews had entered the country from Tunisia in the 1950s, and in the years 1962/1963 most of the 130,000 Algerian Jews decided to go to France. Only 13,000 moved to Israel, and 1,500 remained in Algeria after independence.⁴⁸ Without any natural growth at all, there would have been almost 400,000 Jews in France by 1970. But whatever their natural increase was, 150,000 would have been out of reach.

Unfortunately, the 550,000-figure published by the *Year Book* turns out to be much too low! In the mid-1970s, an official investigation discovered 700,000 Jews living in France. The *International Herald Tribune* commented:⁴⁹

[...] a census report showed there were 700,000 Jews in France, at least 150,000 more than had been believed.

⁴⁶ Tartakower and Grossmann, *Jewish Refugee*, p. 343.

⁴⁷ *AJYB*, 1971, Vol. 72, p. 476.

⁴⁸ *Encyclopaedia Judaica*, Vol. 9, p. 538-539.

⁴⁹ *International Herald Tribune*. "French Policies to Court the Jewish Vote," May 10, 1977, p. 2.

It is true that the North African Jews proved relatively fertile, but the native European Jews exhibited the low birth rate usual for Europe. It may be assumed that this mixed Jewish population was not much larger than 670,000 in 1970 – seven years prior to the official count. Of these, in turn, 185,000 may have been of North African origin (see footnote to *Table 15*). Consequently, the number of European Jews in France probably was 485,000 in 1970. In view of the “original” 238,000 of the year 1945 and the relatively small growth rate, immigration from eastern Europe must have amounted to 230,000 Jews after the war.

As for the pre-war immigration in France, a number of “estimates” exist. But the number of 90,000 (Sixth Chapter) also contained the – mostly foreign – Jews who fled from Belgium and Holland.

The “Missing”

Summarizing, we may say that from the end of WWII until 1970 1,778,000 Jews found shelter in the main Jewish immigration countries. This number is about one and a half times as large as the 1.1 million Jews who entered the same countries during the 1930s (*Table 14*). In analyzing Jewish emigration from the countries occupied by Germany during the war, however, we must disregard France, because this country, even though it was one of the large immigration countries for Jews both before and after the war, was in the German sphere of influence during WWII. Thus, Jewish immigration in all the above-mentioned main immigration countries *outside* the former German sphere of influence totaled 1,548,000 after the war (until 1970). The only possible countries of origin of these more than 1.5 million Jewish immigrants are those European countries (excl. the USSR in today’s borders) which were occupied by Germany during WWII.

In 1970, 860,000 Jews of European origin lived in these very same countries (*Table 15*). If one adds them to the 1,548,000 Jews who left these countries after the war for the main immigration countries (excl. France), then one obtains the minimum number of Jews who must have been living in the former German-occupied European countries (excl. the USSR and the Baltic states) at the close of World War Two, namely, 2,408,000. Their number was probably larger yet, because European Jewry was subject to considerable attrition during the interim 25 years on account of low birth rates and assimilation.

However, highly regarded Zionist organizations like the American Jewish Committee put the number of Jews in those European countries in 1946/47 at only 1.41 million. Thus, the missing million Jews (2,408,000 minus

Table 14: Immigration of EUROPEAN Jews in the Main Countries of Immigration before and after World War Two

	89,000		553,750
Western European countries app.			643,000
Approximate total			860,000

* In 1977, 700,000 Jews were found in France.⁴⁴ The native Jewish population was stagnant, but the younger immigrant Eastern European Jews might have had some growth. Much larger excesses of births over deaths were recorded by the app. 170,000 immigrant North African Jews who arrived in the 1960s. Applying an average rate of growth of at most 0.8%, there were 670,000 Jews in France in 1970. It may be possible that the North African Jews recorded an excess of births amounting to 15,000; if true, 485,000 Jews of European origin were living in France in the year 1970.

⁵⁰ *AJYB*, 1971, Vol. 72, p. 476. The Jewish population figures (1970) given for European countries (excl. France) are not necessarily identical with reality, as *Table 15* shows. According to *AJYB*, 1969, Vol. 70, p. 285, the frequent intermarriages of European Jews, and the withdrawal from the Jewish community often resulting therefrom, caused considerable but unfortunately not ascertainable losses to the European Jewish population.

1,410,000) must have left Europe either during the immediate post-war period or – disregarding the possibility that we were given “political” figures – the count in 1946/47 was incomplete.

The improbability of just 1.41 million “survivors” (1946/47), as published by the *Year Book*, is highlighted by the fact that in that case only half a million Jews (1,410,000 minus 860,000) from the former German occupied countries could have entered the main immigration countries between the end of the war and 1970. The fact is that Israel alone received more than half a million immigrants from these countries after 1948.

Insisting on the 1.41 million figure is to deny the huge Jewish immigration in the Western Hemisphere after World War Two. That, of course, is nonsense. Which European countries these surviving, but statistically “missing” European Jews should be allocated to, cannot be reconstructed today. During the first post-war years, Jewish refugees were streaming week after week, month after month from the East to the West, being transported from camp to camp, and it often lasted years until they finally found their place of final residence. Hundreds of thousands were literally moving “between” the countries, and thus were not recorded in the statistics for individual countries. Certainly, the *Year Book* published figures on the number of Jewish DP’s for 1947 in the case of Italy, Germany and Austria, but not for other countries. For instance, one cannot detect Cyprus – where the British held tens of thousands of Jews wanting to migrate to Palestine – or Morocco and Tunisia.

By proving a large-scale immigration in many countries outside the former wartime German sphere of influence, it was possible to demonstrate that	1,548,000
Jews left Europe between the end of the war and 1970 (<i>Table 14</i>). In 1970, these European countries still contained	<u>860,000</u>
European Jews (<i>Table 15</i>). Consequently, the number of Jews who survived must have been at least	2,408,000.

On the basis of largely Zionist or pro-Zionist data, however, the number of surviving Jews found was only (<i>Table 11</i>)	1,443,000.
This means that the difference constitutes additional survivors in, and/or emigrants from, former German-occupied Europe; their numbers are	<u>965,000.</u>

Thus, while the real number of Jewish survivors in former German-occupied Europe (excl. the USSR in today’s borders) was almost 2½ million, the sum of the actually missing Jews was much smaller. Based on Zionist statistics we arrived in <i>Table 11</i> at	1,269,000
“missing” Jews. Deducting the additional	<u>965,000</u>

survivors from them, European Jews not traceable statistically
number

304,000.

The extent to which these 304,000 represent actual missing persons is difficult to judge. It is known that the Jewish population of German-occupied Europe suffered from an extremely low birth rate. The resulting excess of natural deaths over births was not taken completely into account in the above analysis due to lack of data. In addition, we only considered Jewish immigration in fourteen countries which accepted the bulk of the large number of Jewish emigrants after the war. An investigation of some of the smaller countries of destination certainly would discover further emigrants.

It is thus obvious that the figure of 1.3 million “missing” Jews arrived at on the basis of Zionist information for former German-occupied Europe (excl. the USSR in today’s borders) in no way reflects reality. The huge flow of Jewish immigrants from Eastern Europe after the cessation of hostilities – as described by General Morgan and even Zionist sources – must have exceeded 1.5 million until 1970. This flow also included the majority of the deportees and the Polish Jews under wartime German control.

Organized Flight

It was pointed out before that many Jews managed to escape during the war from the German sphere of influence. They, too, belong to the 965,000 surviving, but statistically unaccounted for European Jews. The exact number of Jews who fled after the start, but before the end, of the Second World War to neutral or Allied countries and regions is not known; it must have reached several hundreds of thousands.

To be sure, the Institute of Jewish Affairs reported that 180,000 Jews escaped from the countries controlled by the Axis powers between the beginning of the war and 1943, but their countries of origin and routes of escape are largely clouded in mystery.⁵¹

Hidden indications can be found here and there pointing to Turkey as an important receiving and transit country for fleeing Jews who tried to reach neutral or Allied overseas countries by ship via the port of Constanza (Rumania) or by rail via Bulgaria. Even more mysterious are the temporary receiving stations for these refugees. The *Year Book*, for instance, does list figures for the Jewish DP-camps in post-war Germany, Austria and Italy, but none for Cyprus, Persia or Morocco where – as was shown in this chapter – many Jewish refugees were admitted before and just after the end of the war.

⁵¹ Institute of Jewish Affairs, *Hitler’s Ten-Year War*, p. 306.

An invaluable piece of evidence describing the extent and organization of this refugee movement during the last 16 months of the war is furnished by the U.S. War Refugee Board. The Board was established by Roosevelt on January 22, 1944, for the purpose, *inter alia*, of aiding the escape of as many Jews as possible from areas under German control. Special representatives of the Board were stationed in all “strategic” places important for the reception, shelter and transportation of these refugees, such as Turkey, Switzerland, Sweden, Portugal, Great Britain, Italy and North Africa.⁵²

The diplomatic status of these representatives enabled them to negotiate with all friendly and neutral governments in the name of the U.S. Government, and even to contact German authorities for the purpose of obtaining the release of Jewish prisoners. The number of Jews freed from German control as a result of these direct negotiations is not specified, but the last U.S.-German exchange is supposed to have taken place in February 1945; the released Jews “were taken to an UNRRA camp in North Africa to await ultimate resettlement.”⁵³

Of much greater importance for the escape of Jews from the German sphere of influence – especially during the last 1½ war years – was their flight to Turkey and, to a smaller degree, to southern Italy. To be sure, the United States had no need to pay attention to a sovereign Italian government, but in the case of neutral Turkey an agreement had to be reached. In order to transfer the escaped Jews on to Palestine and to transit camps in the Middle East and North Africa, the consent of Great Britain and France, *i.e.* de Gaulle, was necessary. The United States Government

*assured the neutral governments that it would arrange for the maintenance of newly arrived refugees and for the evacuation to other places of safety as soon as possible.*⁵⁴

*Representations were therefore made to the Turkish Government for consent to admit into its territory all refugees from Axis areas who might reach the Turkish border. Assurances were given the Turkish Government that the Board would arrange for maintenance of refugees in Turkey as well as for their eventual removal to other places. [...] the Turkish Government finally agreed to grant increased numbers of entrance and transit visas and transportation facilities, and generally to cooperate in this [U.S.] Government’s program to rescue Nazi victims.*⁵⁵

In order to carry out this far-flung escape operation, the services of the UNRRA were utilized, which provided temporary shelter for the Jewish

⁵² U.S. War Refugee Board, *Final Summary Report*, p. 4-5.

⁵³ *Ibid.*, p. 34.

⁵⁴ *Ibid.*, p. 7.

⁵⁵ *Ibid.*, p. 20-21.

refugees and their transport and maintenance on the way to makeshift camps. UNRRA camps sprouted in the Middle East, Italy and North Africa ready to accept thousands of these refugees.⁵⁶

The possibility to escape from the Balkans via Turkey to Palestine and other allied territory existed for Jews since the beginning of World War Two. The route of escape led from the port of Constanza (Rumania) across the Black Sea to Istanbul or by rail through Bulgaria. The Board assumed the task to systematically improve and expand these routes to “develop a steady flow of refugees over these routes through Turkey.”⁵⁷

For this purpose, lesser German and other border officials were bribed, false identification papers were supplied, exit and entry visas were procured, and transportation by boat and by rail was provided for evacuation to safe areas. “*Tens of thousands* were rescued from the Nazis by these clandestine means,” the Board wrote.⁵⁸

*[...] refugees were collected, concealed from the Nazi-controlled Rumanian officials, and placed in small vessels in the port of Constanza. [...] The refugees] were herded by the hundreds on ships built to carry 20 to 50 passengers. [...] late in March 1944, 48,000 Jews were moved from Transnistria to Rumania. Many of them, mostly children, were transferred with other [Jewish] refugees from Rumania to Palestine.*⁵⁹

A second route of escape from the Balkans to Allied territory led from Yugoslavia by boat across the Adriatic Sea to southern Italy. Partisan and other underground units in Slovakia, Hungary and Yugoslavia smuggled Jewish refugees to the coast, where boats organized by the Board waited to receive and transport them to southern Italian UNRRA camps. Approximately 7,000 Hungarian Jews are supposed to have escaped this way, but it is not known whether they were Jews from Greater Hungary or from the Hungarian territory within post-war borders.⁶⁰

In southern Italy the UNRRA maintained numerous camps for the Jews streaming across the Adriatic Sea. Soon, these facilities became overtaxed, and the inmates were transferred to “havens in other Allied territory.”⁶¹ The reference was to the UNRRA camps in North Africa like, for instance, Camp Marechal Lyautey near Casablanca or Camp Philippeville in Algeria.⁶²

The financial means to bribe officials, procure false identity papers, and obtain ship and rail transport in German-occupied areas was paid for by

⁶¹ *Ibid.*, p. 64.

⁶² *Ibid.*, p. 61-62.

funds channeled through “neutral” Switzerland and from there to the Jewish organizations in Hungary and elsewhere.⁶³

It is unfortunate that the Board made no references as to the total number of Jews who escaped from Axis territory through its assistance. Here and there the report mentions some figures for particular national Jewish groups, but generally the Board just mentions hundreds, thousands and tens of thousands coming out of German-occupied Europe. The fact that

- at the end of the war, there were 8,000 more Jews in Bulgaria than at the beginning,
- 6,000 Hungarian Jews were found stranded in Rumania after the war,
- 60,000 and more than 100,000 *European* Jews, respectively, arrived in Israel from Persia and Morocco between 1948 and 1970,
- the Jewish population of Palestine increased by about 100,000 between 1939 and 1945, with only a fraction thereof accounted for by natural net growth,
- the Institute of Jewish Affairs reported 180,000 escaped Jews between the beginning of the war and 1943,
- the U.S. Government’s War Refugee Board and the UNRRA had systematically organized the escape of a stream of refugees through Turkey and southern Italy,

permits us to assume a gigantic flight and evacuation during the war from areas of former German-occupied Europe: it numbered many hundreds of thousands.

⁶³ *Ibid.*, p. 32-33.

EIGHTH CHAPTER:

The World Jewish Population

The Demographic Development before the War

As late as the early 1930s, 9.5 million Jews lived in Europe (incl. the Soviet Union).¹ Almost two-thirds of them either were never in the German sphere of influence or escaped from it. On the other hand, Europe's Jewish population was in the midst of a process of dissolving its former concentration long before Hitler's ascension to power. This dissolution was the consequence of a large flow of emigration from eastern European countries, negative net birth rates, conversions and general assimilation tendencies. The economic crisis of the 1930s and the officially managed anti-Jewish measures in Greater Germany, Poland, Rumania, etc., intensified the efforts of Jews to turn their backs on Europe. The outbreak of World War Two finally destroyed their one-time stronghold in Europe, except for a few remnants on the western rim of the Occident.

About one million Jews left Europe before the war. Roughly half a million lived anyway in European countries never occupied by Germany, and between September 1939 and mid-1940 more than two million Jews disappeared in the Soviet Union and shared the fate of the other three million Soviet Jews. Consequently, only 2.8 million Jews remained in the countries that were to come within the German sphere of influence until June 22, 1941. Another three-quarters of a million Jews fell into German hands when Axis troops struck in order to forestall a Soviet attack, bringing the total number of Jews in the German sphere of influence in Europe during the Second World War to 3.5 million.

Of the 5 to 5.5 million Jews in the USSR (1940), one million inhabited from the start the territories outside the maximum German expansion in Russia, close to another million were deported by the Soviets from the western frontier areas to Siberia in the spring of 1940 already, and four-fifths of the remaining 3.5 million Jews withdrew more or less voluntarily with the Red Army in 1941.

North America		4,926,736
Americas		5,283,150
World Jewish population		15,840,532

Source: *AJYB*, 1944, Vol. 46, p. 501 for all countries except Rumania and the Netherlands; for these two countries “estimates” were provided by the Year Book, even though the Dutch census of 1935 registered 111,917 Jews (*AJYB*, 1940, Vol. 42, p. 602) and Rumania’s census of 1930 found 756,930 Jews (Hilberg, *Destruction of the European Jews*, p. 486).

After World War Two, 2.4 million Jews were found to be alive in the former German-occupied European countries (excl. the USSR); about 300,000 are statistically unaccounted for. Over one million of the more than five million Jews died during the war in the Soviet Union, the largest part either as Red Army men or in Siberian labor and concentration camps. Probably up to 4.3 million Jews survived the war in the Soviet Union, and as late as 1980 prominent Zionist personalities like Dr. Nahum Goldmann estimated the number of Soviet Jews at up to 3.5 million. But meanwhile hundreds of thousands had left the Workers’ Paradise during the past three and a half decades, and considerable negative net birth rates and numerous mixed marriages caused Soviet Jewry to suffer great losses.

Fitting the numerical development of the Jewish population in Europe into that of world Jewry is aggravated by the fact that there are no reliable figures on the actual number of Jews throughout the world. In most countries, Jews are still not considered an ethnic, but a religious minority and, strangely enough, political Zionism was unable so far to persuade the governments of the Western countries with the largest Jewish populations to include them separately in the periodic censuses.

This situation led to large differences in the estimates of the world Jewish population even before the Second World War. As a rule, the Jewish population estimates were too low for the immigration countries, too high for the countries of emigration and, generally, Jewry was endowed with far too large rates of natural increase. This is particularly a problem for the last pre-war figure, namely, the world Jewish population estimated at 16.7 million in 1939. The huge shift of millions of Jews to the East, West and South caused by the war and its aftermath, and the political interest in

keeping the pre-war figure high, made it impossible so far to attain an objective correction of this number; yet, historical truth demands it.

For most of the countries of the world the latest official and semiofficial pre-war figures are available only for the early or the middle 1930s. Exceptions are the United States, Palestine, the Soviet Union and Greater Germany. On the basis of the last censuses or estimates for the countries listed in *Table 16* one obtains the following summary:

North and South America	5,283,150
Asia, Africa, Australia	1,365,739
European countries not occupied by Germany during World War Two	334,433
Countries outside the area of wartime German influence	6,983,322
Countries inside the area of wartime German influence	5,584,163
World Jewry outside the USSR and the Baltic countries	12,567,485
Soviet Union and the Baltic states	3,273,047
World Jewry	15,840,532

In *Table 17* we listed the census years when the Jewish population of the individual countries was counted or estimated last before the war. Classified by periods of time, the summary is as follows (in 1,000):

	A	B	C	D	E	
	1923/25	1926/32	1933/35	1936/38	1939	Sum
North and South America	0	175	333	4,774	1	5,283
Asia, Africa, Australia	2	172	352	415	424	1,366
Europe	0	5,199	227	242	250	5,918
World excl. USSR and Baltic states	2	5,546	912	5,431	676	12,567
Soviet Union and Baltic states	155	0	98	0	3,020	3,273
World Jewry	157	5,546	1,010	5,431	3,696	15,841
Years until 1939 (average)	15	8	5	2	1	
Average percentage increase	0.2	0.2	0.7	0.5	0.3	
Possible Jewish population at the end of 1939	162	5,635	1,046	5,485	3,707	16,035

The main countries listed in columns A and B are Lithuania, Poland, Hungary, Czechoslovakia, Rumania and England. Poland registered a very small natural increase of only 0.2% for its Jewish population before the war already; Hungary's Jews suffered a negative net growth rate. In Czechoslovakia and probably in England, the Jewish population was stagnating, and Rumania's Jews, too, recorded just a very small natural growth (0.2%) in the 1930s. The relatively high rate of growth of the small number of Asian and African Jews cannot possibly have affected the overall rate for these columns. An average rate of 0.2% seems ample under the circumstances.

Table 17: World Jewish Population in the 1930s
— by Census Years —

Year	Europe	+ Asia	+ Australia	+ Africa	+ Americas	= World
Unknown		25,000				25,000
1920-1925	155,160	1,703		477		157,340
1926	3,686			882	4,568	
1928	72,791					72,791
1929		5,000			566	5,566
1930	1,590,206				17,747	1,607,953
1931	3,532,216	54,418		112,889	155,614	3,855,137
1933	111,917		23,553		47,800	183,270
1934	116,700	700		72,550		189,950
1935	96,623	229,800			285,545	611,968
1936	240,000		2,653	382,377	150	625,180
1937	1,755				4,771,122	4,772,877
1938		200		30,046	2,348	32,594
1939	250,448	424,373			620	675,441
1940					756	756
World <i>excl.</i> USSR	6,171,502	741,194	26,206	598,339	5,283,150	12,820,391
1939 USSR	3,020,141					3,020,141
World	9,191,643	741,194	26,206	598,339	5,283,150	15,840,532

Source: *Table 16*,

The countries listed in column C are distributed quite evenly among the Western Hemisphere, Europe and Asia/Africa. The small or even totally absent growth rates in Europe were more than offset by the large growth rates in Asia. Still, the applied average rate of 0.7% seems somewhat high. U.S. Jews dominate column D almost completely. Their rate of natural increase is not certain, but we do know that the highly urbanized U.S.-Jewish population recorded much lower net growth rates than the U.S. average; also, other U.S. population sections (for instance, the non-white and the rural white population) were blessed with a growth rate far in excess of the U.S. average of 0.75% (1935-1939).² Thus, an average rate of 0.5% in column D is probably exaggerated. Column E also was provided with a growth for one year, because the Soviet census took place in January of 1939. Here too, it seems that the applied increase of 0.3% is rather generous, because the Soviet-Jewish population stagnated long before the war, as Prof. Lorimer pointed out.

The maximum size of the world Jewish population thus cannot have exceeded 16.04 million in 1939. A scrutiny of *Table 17* shows that the census dates of the countries receiving Jewish immigrants in the Western Hemisphere and Palestine happened to fall into the second half of the 1930s,

² U.S. Department of Commerce, *Population Estimates*, p. 1.

whereas those of the European emigration countries, excepting Germany, were to be found at the beginning of the decade, generally 1930/1931. No question, the census count of many immigration countries included Jews who were also covered by the population statistics of Poland, Rumania, the Baltic, Hungary, Czechoslovakia, Greece, etc. Considering the half a million Jewish emigrants from Poland in the 1930s and the many tens of thousands from other European countries, it is certain that double counting must have amounted to at least 100,000, probably more. We can be sure that the Jewish world population of 1939 never reached the 16-million mark; it was at least 700,000 smaller than is usually assumed.

The elusiveness of the figure of 16.64 million published by the *Year Book*³ can be demonstrated another way: For this figure to be true, the Jews would have had to grow by an annual average rate of 1.2% since the last count in the individual countries until 1939. This rate is 50% larger than the populations of North America and Europe with their very large rural population were able to show! This is obvious nonsense.

In the official *Statistical Abstract of Israel*, a similar unreal number may be found for 1939, namely, 16.7 million. The same source also mentioned the worldwide Jewish population for the years 1914 and 1925:⁴

1914	13.5 million
1925	14.8 million

An increase by 1.3 million from 13.5 million to 14.8 million within eleven years is equivalent to an annual rate of 0.85%. Before and after these dates, millions of Jews left eastern Europe and emigrated mainly to North America, where their natural increase soon began to decelerate in the new urban commercial environment. Also, the economic crisis of the 1930s produced the same trend to lower birth rates among the Jews as was true for all industrial nations. But an increase to 16.7 million in 1939 would correspond to an average rate of +0.9% per year. Not only would the Jews have had an actual rise in their rate of natural increase, but – contrary to the trend of those years – their fertility would have been considerably larger than was recorded for central and western European countries. This is absurd!

However, an increase by 1.2 million from 14.8 (1925) to 16 million in 1939 would amount only to an average rate of growth of 0.55% per annum. Even this rate would seem rather high in view of the drastically falling Jewish birth rates in eastern Europe, the negative tendencies in some central and southeastern European countries, and a moderate growth in the United States. Still, considering the whole development since 1914, it appears much more realistic. By way of comparison: The U.S. population

³ *AJYB*, 1946, Vol. 48, p. 603.

⁴ *Statistical Abstract of Israel 1971*, Table B/3.

recorded an average net growth rate of only 0.8% between 1930 and 1939 despite a fast growing non-white and white rural population.⁵ In Germany the net rate was 0.7-0.8% (however, there was a decline from 0.9% in 1925 to 0.66% in 1930 and a rise from then on to 0.8% by 1939).⁶

To be sure, the much publicized emigration from Germany and the immigration into Palestine was reflected in the *Year Book*’s figures, but the considerably larger emigration from eastern Europe was disregarded almost entirely. The fact that the United States had accepted more than 400,000 Jewish refugees and immigrants was made public only in 1943 during hearings of an investigating committee of the U.S. House of Representatives. But those hearings did not receive particular notice. Thus, while Jewish immigration showed up to a small extent in the statistics for the immigration countries, emigration was disregarded in the statistics for eastern Europe. This situation had dire consequences for the ascertainment of the total number of the pre-war Jewish population and the number of missing persons. To all appearances, the overseas immigration countries displayed fewer Jews than actually were present before and after WWII, and the eastern European emigration countries were assigned numbers that were exaggerated by 800,000!

The country-specific investigation in the First and Sixth Chapter points to a net emigration before and during the war of at least 1,121,000 (*Table 18*). It is possible, though, that this figure does include some negative net growth, because sometimes the data available was just too scanty.

Table 18: Jewish Emigration before and during World War Two

Czechoslovakia	52,300
Germany and Austria	442,000
Hungary	5,500
Poland	500,000
Rumania	121,600
Total	1,121,000

Source: First and Sixth Chapter. The escape of about 30,000 Jews from France in 1940 was not taken into account; they consisted mainly of refugees from Germany, Poland and Czechoslovakia, and thus would in effect constitute a double counting.

Analyzing immigration in the main immigration countries – *i.e.* Palestine, the United States, Canada, Australia, England, South Africa, France and seven Latin American countries – *before* the end of WWII, we found 1,059,000 Jews in the Seventh Chapter (*Table 14*). In addition, there were many other smaller countries which also accepted thousands of Jewish refugees, such as Switzerland, Sweden, New Zealand, China, for instance.

⁵ U.S. Department of Commerce, *Population Estimates*, p. 1.
⁶ Hardach, Karl. *Wirtschaftsgeschichte Deutschlands im 20. Jahrhundert*, Göttingen, 1976, p. 246.

It is apparent that the emigration and immigration figures for the period before the end of WWII as developed in this study are more or less balanced, each in effect confirming the other.

A Question of Millions

In order to check on the accuracy of the world population figures as published by the *Year Book* for the post-war period (1946), we established two groups which will be looked at separately: The Soviet (or those living in the Soviet Union) and the non-Soviet Jews.

As mentioned above, the world Jewish population of 1939 numbered less than 16 million; of these, 3.02 lived in the Soviet empire; the non-Soviet Jews thus counted fewer than 13 million in 1939. Within a few months, the Soviets acquired millions of Polish, Baltic and Rumanian Jews. On balance, the division looked like this one year later:

World Jewish population 1939 (maximum)	16,000,000
<i>deduct:</i>	
– “Old” Soviet Jews (1939)	3,020,000
– Former Polish Jews (1939/1940)	1,867,000
– Former Baltic Jews (1940)	225,000
– Former Rumanian Jews (1940)	225,000
Total Soviet Jews	5,337,000
<u>Jews <i>outside</i> of the Soviet Union 1940 (maximum)</u>	<u>10,663,000</u>

Early in WWII, the rough distribution of these 10.7 million non-Soviet Jews was as follows:

United States (1943) ⁷	5,200,000
Canada (1941) ⁸	170,241
Latin America (1943) ⁸	584,384
Western Hemisphere	5,954,625
Palestine (1939) ⁹	424,373
Asia (incl. Turkey) (1939) ¹⁰	376,500
Africa (1939) ¹⁰	609,800
Australia/New Zealand (1939) ¹⁰	33,000
European countries <i>not</i> occupied by Germany during the Second World War ¹¹	384,500
Countries <i>outside</i> the subsequent German sphere of influence	7,782,798
European countries <i>inside</i> the subsequent German sphere of in- fluence 1939 ¹²	2,952,000
Jews <i>outside</i> the USSR 1939/1943 (maximum)	10,735,000

For the Western Hemisphere no figures were obtainable for 1939. They are therefore somewhat too high and reflect the immigration during the first war years. On the other hand, the population of 384,500 for the unoccupied European countries probably is too low by several tens of thousands. Generally though, the total of 10,663,000 is quite in line with the sum of the individual country groups for the years 1939/1943. It is rather improbable that the post-war figure for the Jews living *outside* the Soviet Union exceeded the pre-war figure, because possible negative net growth rates in Europe during the war, direct war losses (soldiers and partisans killed in combat), chaotic conditions in the German camps during the closing months of the war, Allied bombing raids, etc., may have pushed the total down to at least 10.6 million or below.

Comparing these 10.6 million survivors with the 9 million outside the Soviet Union as published by the *Year Book* for 1946 (*Table 19*), there is a gap of 1½ million.

The *Year Book* figure of 9 million for 1946 includes only 5.75 million Jews in North and South America. But the *Year Book* itself admitted to 5.95 million Jews in this region in the year 1943, and in 1945 and 1946 other hundreds of thousands of Jews coming from devastated Europe had arrived in the New World. Evidently, the *Year Book* understated the 1946-figures for Western Hemisphere by half a million persons.

¹¹ *Ibid.*, p. 740.

¹² In 1939 (before the outbreak of the German-Polish war), 5,044,000 Jews lived in those European countries later occupied by Germany (excl. USSR and Baltic countries) according to *Table 11*. Of these, 1,867,000 Polish and 225,000 Rumanian Jews came within the Soviet empire before the start of the war; there remain 2,952,000.

Table 19: Purported World Jewish Population: 1939 and 1946 – according to the American Jewish Year Book¹³

	1939	1946 ^x	Difference
A. World <i>outside</i> the German sphere of influence in World War Two			
– North and South America	5,489,620	5,756,700 +	267,080
– Asia, Africa, Australia	1,494,300	1,647,000 +	152,700
– Unoccupied Europe	384,500	419,000 +	34,500
	7,368,420	7,822,700 +	454,280
B. German sphere of influence <i>outside</i> the Soviet Union:			
– Poland	3,250,000	120,000 –	3,130,000
– Czechoslovakia	360,000	55,000 –	305,000
– Rumania	850,000	300,000 –	550,000
– Other European countries	1,539,700	669,600 –	870,100
	5,999,700	1,144,600 –	4,855,100
C. World <i>excl.</i> the USSR	13,368,120	8,967,300 –	4,400,820
D. Soviet Union and Baltic states	3,275,000	2,032,500 –	1,242,500
E. World Jewish Population	16,643,120	10,999,800 –	5,643,320
of which:			
F. Jewish population in the German sphere of influence (B + D) ^y	9,274,700	3,177,100 –	6,097,600

x The *Year Book* listed the world Jewish population for 1946 as 11,123,800, but an addition of the individual countries totaled only 10,999,800; it is not clear where the difference of 124,000 should be looked for, but it seems the Rumanian figure may be wrong.

y In this table the entire Soviet Union appears as having belonged to the German sphere of influence; in reality, in 1939 one million Jews lived already outside the territory later occupied by German troops.

In Asia, Africa and Australia, too, the actual number of Jews in 1946 was not 1.67 million, as the *Year Book* would like us to believe, but hundreds of thousands more. As we mentioned already, the Jews coming from eastern Europe were moved from camp to camp in western Europe, and many were quartered temporarily in UNRRA camps in the Middle East, Cyprus and North Africa. We know, for instance, that about 200,000 *European* Jews immigrated into Israel after May 15, 1948, coming from Persia, Morocco and Tunisia (see Seventh Chapter).

The figure of 1.6 million Jews in all of Europe (1,145,000 plus 419,000) as published by the *Year Book* for 1946 also is much too low. We have seen in the Seventh Chapter that roughly one million more Jews had survived in the countries within the former German sphere of influence (excl. the USSR) than was admitted to by the *Year Book*. In addition, the *Year*

¹³ *AJYB*, 1946, Vol. 48, pp. 603-607.

Book committed an obvious mistake in the case of the Rumanian Jews, because in the following year already the figure for the Jewish population of Rumania was increased by 130,000.

The statistical data published by the *Year Book* become even more doubtful when one realizes that the figure of 11.33 million for 1970 (excl. the USSR) is too low by several hundreds of thousands – despite the huge jump by 30% within only 24 years! The *Year Book* listed only 5.9 million U.S. and 550,000 French Jews. In reality, there were 6.6 million in the United States and almost 700,000 in France.

For 1970, the *Year Book* mentioned the following Jewish population:¹⁴

in Europe (excl. France)	837,150
in Asia (incl. Turkey and Israel)	2,707,200
in Africa	196,600
in Australia and New Zealand	77,000
in Latin America	812,925
totaling	4,630,875.

Furthermore, the Canadian census of 1971 listed ¹⁵	296,945
in the United States we found (Seventh Chapter)	6,600,000
and in France (Seventh Chapter)	670,000.

In 1970, the world Jewish population outside the Soviet Union was at least	12,200,000.
--	-------------

It is almost certain that this figure of 12.2 million for 1970 is too low as well. As mentioned already, an official investigation in France found 150,000 more Jews than was admitted to by the *Year Book*. In other countries the situation may be very similar. The Zionists themselves admit that the Jewish population is suffering from attrition through assimilation in all European countries – in East and West. The number of Jews who fail to appear statistically as Jews because of this development is not known, but the examples of France, where the *Year Book*'s estimate is 20% below the official figure, and of the United States, where more than one million Jews disappeared from the statistics, provide some food for thought. We may be sure that the real number of Jews outside the USSR exceeded 12.3 million in 1970.

In this connection, we find a very interesting piece of information in the *Israel Almanach* (1958-1959), published by the Zionist World Organization (ZWO) headquartered in Jerusalem. We learn from it that the 1.8 million Jews of Israel in 1958 were equivalent to *one-eighth* of the Jewish

¹⁴ *Ibid.*, 1971, Vol. 72, p. 475-476.

¹⁵ *Ibid.*, 1975, Vol. 76, p. 251.

world population.¹⁶ In effect, this renowned Zionist source was estimating the number of Jews in the world at 14.4 million in 1958. Unfortunately, the ZWO did not provide more detailed figures on this subject, and we are left guessing as to how many Soviet Jews were included in this estimate. Officially, the figure which was current in those days in Zionist literature on the Jews in the USSR was around 2.3 million. Deducting it from the 14.4 million, we arrive at a Jewish population outside the USSR of 12.1 million for 1958. This estimate is very close to our own calculations of at least 12.3 million.

Henri Zoller, the Israel-correspondent of the German newsmagazine *Der Spiegel*, wrote in the summer of 1980 that 80% of the world Jewish population was still living in the diaspora.¹⁷ Thus, if Israel's 3¼ million Jews¹⁸ constituted 20% of world Jewry in early 1980, this one-time Jewish member of the French Resistance is putting the number of Jews in the world at 16.3 million in 1979/1980.

Now, Henri Zoller may not be exactly an expert on questions of Jewish demography, but Dr. Nahum Goldmann, the former president of the World Jewish Congress and one of the most prominent leaders of world Zionism, was one of the best-informed experts on the size of the world Jewish population. Dr. Goldmann, too, stated that 80% of world Jewry was living in the diaspora in early 1980.¹⁹ In other words, only one-fifth was to be found in Israel. Dr. Goldmann rounded his figure for Israel to 3.5 million. Official Israeli statistics mention only 3¼ million Jews for early 1980. On the basis of these 3¼ million, one arrives at 16.3 million Jews in the world according to Dr. Goldmann.

Contacted by personal letter, Dr. Goldmann replied that Soviet Jews counted 3 to 3.5 million in 1980.²⁰ Deducting the upper end of his estimate, let us say 3.4 million, from the world Jewish population of 16.3 million, there remain 12.9 million Jews in the world outside the USSR.

It is noteworthy that Dr. Goldmann's admission is putting him squarely in the corner of the Jewish dissidents in the USSR with regard to the number of Jews in the Soviet Union. If he places the number of Soviet Jews at 3 to 3.5 million in 1980, he is saying in effect that in the early 1970s there were 3.5 to 4 million Jews in the Soviet Union. After all, one-quarter of a

¹⁹ Goldmann, Dr. Nahum. "Aus Sorge um Israel," *Die Zeit*, No. 29, 7/11/1980, pp. 13f. A short time before his death, Dr. Goldmann was still more specific: in *Der Spiegel* ("Israels Regierung hat das Volk betrogen," No. 34, August 28, 1982, p. 9); he narrowed Israel's share of the world Jewish population down to less than 20%; applying this rate to Israel's Jewish population of 3.2 million, Dr. Goldmann, in effect, placed world Jewry at over 16.5 million.

²⁰ Goldmann, Dr. Nahum. Private letter dated 2/13/1981.

million Jews left the Workers’ Paradise during the past decade, and the excess of deaths over births may have reached up to one per cent per year for the Soviet-Jewish population during that period, or about 200,000.

Ostensibly, the development of world Jewry looked like this during the past forty years:

Purported World Jewish Population outside the USSR
– 1940, 1946, 1970, 1979 –

Year	Population Changes		Period (Years)	Average Annual Changes in percent since		
	(Mio.)	(Mio.)		1940	1946	1970
1940	10.6	–	–	–	–	–
1946	9.0	–1.6	6	–2.7	–	–
1970	12.3	+3.3	24	0.5	1.3	–
1979	12.9	+0.6	9	0.5	1.1	0.5

We note that the entire increase for the last 9 years amounted to just 0.6 million (or even less). This is quite a contrast to the thirty years prior to this, which were characterized by extremely large plus and minus changes but which, as the whole, recorded a most remarkable increase of 1.7 million. The suspicion is not unfounded that the contrary developments before and after 1946 are directly connected with each other. To be sure, one could blame the reduction between 1940 and 1946 on the German measures within the so-called “Final Solution,” but there is no sensible explanation for the unheard of “fertility” between 1946 and 1970, namely, +1.3% p.a.!

The almost totally urbanized world Jewish population – which lived almost entirely in the large urban centers in the East and West and which not only recorded a birth rate that has been dropping for generations, but also suffered a relatively low net growth rate before the war already – would have demonstrated a fertility after the war close to the biological limit and nearly equivalent to the population growth in the developing countries.²¹ This is pure fantasy!

There is only one reasonable conclusion: The figure published by the *Year Book* for the world Jewish population outside the USSR in 1946 did not conform to reality. Political reasons were decisive for putting the number so low. Leaving aside the *Year Book*’s obviously manipulated figure for 1946, the 40-year demographic development of world Jewry outside the Soviet Union begins to look much more realistic:

²¹ *AJYB*, 1980, Vol. 81, pp. 61f.: Since the middle of the 1960s at the latest, there has been a drastic drop in births.

Probable World Jewish Population outside the USSR
– 1940, 1970, 1979 –

Year	Population Changes		Period (Years)	Average Annual Changes in percent since	
	(Mio.)	(Mio.)		1940	1970
1940	10.6	—	—	—	—
1970	12.3	+1.7	30	0.5	—
1979	12.9	+0.6	9	0.5	0.5

The development evident from the above compilation shows no contrast between the time before and after 1970. The growth rate for the 30-year-period before 1970 was relatively large despite the losses in WWII, because it also included the short-lived Jewish baby boom of the immediate post-war period. This growth of 0.5% per year until 1970 of the highly urbanized extra-Soviet world Jewish population is relatively large and represents conclusive evidence that the losses suffered in the war were relative small – at least as far as the Jews outside the Soviet Union are concerned.

At first glance it is surprising to see the growth rate maintain this level after 1970 as well, despite the reduction of the birth rate in all industrial countries since the early 1960s. This seemingly high rate of 0.5%, however, reflects also the quarter of a million Jews who emigrated from the USSR in the last decade. It is correct, of course, that Israel's immigrant population registered notable growth rates even after 1970, but all Zionist statements regarding the Jewish population in the rest of the Western World and in eastern Europe point to a drastic aging process and frequent negative net growth rates.²²

²² *Ibid.*, 1969, Vol. 70, p. 275:

In all diaspora Jewish communities for which we have data, the proportion of elderly and old people is greater than in the surrounding general population. This is basically due to low fertility over the last few decades. [...] Contributory factors may be the differential impact of withdrawals and a recent negative migration balance, involving particularly younger adults. [...] more than half of some European Jewish populations are above the age of 40. In Europe and America the aging of the Jewish populations has led to an exaggerated proportion of persons no longer participating in reproduction while being subject to the comparatively high age-specific mortality of the elderly.

The AJYB (pp. 274-275) goes on:

The population dynamics of the Jews in Europe, the Americas, South Africa, Australia, and New Zealand should be viewed in the context of their socio-economic position. These Jews have a strong tendency toward urbanization, educational attainment, and concentration in white-collar occupations and higher income brackets. In most of these countries, the relatively small or highly dispersed Jewish communities are strongly affected by environmental influences, secularization and assimilation. [...] The keynote is the very low level of Jewish fertility. In all countries for which data are available, including the United States, the fertility of the Jews is below that of the general population. In several countries it has fallen below replacement level. After a short-lived post-World War II baby boom, Jewish birth figures declined in the 1950s.

The demographic development of the Jews in the Soviet Union was discussed before, and there is no reason to repeat the statistical details at this point. Adding the 3½ million Soviet Jews – as confirmed by Soviet-Jewish dissidents, the *Encyclopaedia Judaica* and Dr. Goldmann – to the almost 13 million Jews outside the USSR, one obtains a total of 16.5 million for world Jewry. This is about half a million more than in 1940! The losses of at least one million during the war – mainly while serving in the Red Army, during the more or less forcible Soviet evacuation to Siberia, and in the Siberian labor camps – caused the Jewish world population to drop below the 15-million-mark. Since the end of WWII, it multiplied by at least 1.5 million, and thus more than compensated for the losses incurred as a result of the war and Soviet barbarism. This is equivalent to a worldwide net growth of 0.4% p.a. since the end of the war.

Even today the world Jewish population figures still reflect the political interests of Zionism, and estimating “mistakes” usually lead to figures for the post-war Jewish populations which are too low. Nevertheless, the ever more frequent larger population statistics for the USSR represent a fundamental admission by Zionism that the original post-war figures were much too low. Slowly, but steadily, they are working themselves toward the real world Jewish population size – even though the means applied are implicit, unrealistic assumptions regarding Jewish fertility.

The purpose of this analysis was not to investigate the content of truth in the “Holocaust” story, but to outline the extent and the direction of the Jewish population movement before, during and after World War Two. If the developments as traced here are in conflict with the taboos of contemporary historians, it is their task to reconsider an untenable position.

Even though the well-known “Holocaust” figures are of only minor interest in this study, it is necessary, nevertheless, to sketch the main controversial positions as far as the statistical data is concerned. Between 1939 and 1946, the *Year Book* found that the world Jewish population had been reduced by one-third from 16.64 million to 11 million (*Table 19*). Admittedly, the largest reduction was registered by today’s Communist countries, but for the USSR itself the loss was put at “only” 1¼ million. In contrast, the countries beyond the former German sphere of influence recorded a plus of almost half a million Jews, obviously largely the result of migratory gains.

The fact that the political boundaries of 1946 in no way corresponded with those of 1939 – especially in the cases of Poland, Czechoslovakia, Rumania and the Soviet Union – was not mentioned at all by the *Year Book*, let alone taken into account in the determination of war losses. Only in the case of Rumania did the *Year Book* mention that the post-war borders excluded northern Bukovina and Bessarabia; yet this footnote was not reflected in the purported number of “missing” Rumanian Jews. The an-

nexation of eastern Poland (1939) and Ruthenia (1945) by the USSR was completely disregarded. In short, a comparison of Jewish population statistics for 1939 and 1946 is incorrect in principle.

Certainly, this would make no difference as far as the total number of “missing” persons is concerned, *if* the figures for 1939 and 1946 were correct. But the crucial question is precisely how reliable these figures are. After all, it was the Soviet Union which acquired most of the Polish Jews in 1939/1940, besides hundreds of thousands of Rumanian and Baltic Jews. Any observer would immediately recognize the dubiousness of the “missing” figures, if the comparison would depict the fact that the bulk of the “missing” Jews is ascribed to that country which, with regard to falsification, lies, deception and statistical manipulation, is in a class by itself, and whose inhuman “scorched earth” initiatives forced tens of millions of people from all walks of life to move from the embattled areas to Siberia during the war.

Adjusting the pre-war figures to take account of the border changes and population movements until 1941, an entirely different picture develops (*Table 20*). To be sure, this table, too, points to five million “missing” Jews and creates the erroneous impression that eight million Jews came within the German sphere of influence, but otherwise it presents a very different view.

First of all, we see that the Jewish population *outside* the former German sphere of influence in 1946 is too low by hundreds of thousands (point A). A reduction by 200,000 in the Western Hemisphere during the interim years, when hundreds of thousands of Jews immigrated from Europe, is hardly in conformity with reality.

Secondly, the table shows clearly that the vast bulk of the “missing” Jews must be sought in the Soviet Union.

Assuming that the Jewish population of the Western Hemisphere maintained its size between 1943 and the end of the war, that the losses on the Soviet side exceeded one million, that the surviving post-war Jewish population numbered more than four million in the Soviet Union, and that the number of Jews who left Europe after the war – although “officially” unaccounted for – reached one million, the comparison with 1941 produces considerable differences with the current version of contemporary historians. These corrections were made on *Table 21*. There we see that the worldwide losses suffered by the Jews during the Second World War were in the neighborhood of 1¼ million – 8% of world Jewry – caused largely not by the direct impact of the war, *i.e.* those killed in action, but by Soviet barbarism. Over two hundred thousand remain unaccounted for. This latter worldwide figure agrees roughly with the missing figure of about 300,000 calculated for Europe in the Seventh Chapter.

Table 20: Purported World Jewish Population: 1941 and 1946
1941: according to results of this analysis
1946: according to the American Jewish Year Book (in 1,000)

	1941	1946 ^x	Difference
A. World <i>outside</i> the German sphere of influence in World War Two			
– North and South America	5,955 ('43)	5,757	– 198
– Asia, Africa, Australia	1,444	1,647	+ 203
– Unoccupied Europe	384	419	+ 35
	7,783	7,823	+ 40
B. German sphere of influence <i>outside</i> the Soviet Union: ^x			
– Poland	757	120	– 637
– Czechoslovakia	155	55	– 100
– Rumania	315	300	15
– Other European countries	1,511	670	– 841
	2,738	1,145	–1,593
C. World <i>excl.</i> the USSR	10,521	8,967	–1,554
D. Soviet Union, Baltic countries and Ruthenia	5,446	2,033	–3,413
E. World Jewish Population	15,967	11,000	–4,967
of which:			
F. Jewish population in the German sphere of influence in the years 1941–1945 (B + D) ^y	8,184	3,178	–5,006

x For 1941, see *Table 11* *excl.* Ruthenia.

y In this table the entire Soviet Union was listed as having belonged to the German sphere of influence; in reality, in early 1941 only 3¾ million Jews lived in the area later occupied by German troops (disregarding the Ruthenian Jews).

Regardless of whether one traces the development of the Jewish population in Europe country by country or more generally for the world, the missing remainder seems to narrow to two or three hundred thousand. Even this figure has no claim on absolute certainty. Available data on population size, migration, flight and deportation, fertility and mortality rates, mixed marriages and assimilation tendencies often are so vague that it would not have been surprising to obtain a *statistically* unaccounted difference which is larger by several hundreds of thousands or near zero.

*Table 21: Probable World Jewish Population: 1941 and 1945
(in 1,000)*

	1941	1945	Difference
A. World <i>outside</i> the German sphere of influence in World War Two

F. World Jewish Population	15,967	14,730	–1,237
G. Jewish losses in the Red Army, in Siberian labor and concentration camps, etc.			1,030
H. Statistically unaccounted for			– 207

* Of the 5.5 million Jews, approximately 700,000 Soviet Jews fell into German hands besides the roughly 100,000 Ruthenian Jews. On balance, no more than 3.5 million Jews were ever under German control during World War Two.

The Great Migration

Today's dispersion of the Jews in all parts of the world is without precedent in Jewish history. What irony of fate that just in the age when a political force – Zionism – finally gave geographic substance to the old yearning "Next year in Jerusalem," assimilation in the diaspora became the driving force in a process of dissolution that may prove fatal in the end.

The Second World War destroyed Jewry in Europe as an important, geographically concentrated population group for all time. Other centers appeared in the place of Europe – the United States, Israel and the Soviet Union – and one may presume that these three countries include 80% of world

Jewry within their borders today. Basically, the world's Jewish population never was as divided and dispersed throughout the world as it is at present.

But this process of dissolution did not start with the Jewish drama in World War Two, or with the growing anti-Semitism in the 1930s, or with the division of Eastern Jewry following the establishment of Soviet might on the ruins of Tsarist Russia. It began in the second half of the 19th Century with the swelling Jewish westward drive, when literally millions of Eastern Jews poured into the melting pot across the ocean.

At the end of the 19th Century almost 90% of all Jews in the world lived in Europe,²³ and within Europe almost exclusively in an area whose "borders" ran from Lithuania through Poland to Hungary, turning east to the Sea of Azov and from there, encompassing the Ukraine and White Russia, north towards the Baltic countries. In those days, world Jewry was concentrated in three European countries, but, nevertheless, occupied a relatively well-defined geographic core. More important, the Jewish population in this area was rather homogeneous with regard to language (Yiddish) and religion (little secularization).

The so-called dispersion of the Jews throughout the world was nothing but a fable until the end of the 19th Century. It became a reality only in the 20th Century. The emigration of millions of Jews to America, the accelerated migration to the east and north within the Soviet Union during the last war, as well as the settlement of Palestine after World War One brought about the dissolution of Eastern Jewry, which seemed so stable just three generations ago, and dispersed them to all corners of the earth.

Today, four-fifths of the Jews live in regions where a hundred years ago not even three per cent of world Jewry could be found, *i.e.* the Western Hemisphere, Israel, Russia proper (*excluding* the Ukraine and White Russia), Siberia, Africa and Australia. On the other hand, most of the historic regions of the traditional diaspora are almost entirely without Jews today; this applies especially to eastern Europe, the Balkans, North Africa and the Middle East.²⁴

This process continued uninterrupted after the last war. It is, however, very difficult to obtain a rough outline of this development since 1945 because of a whole barrage of problems. Not only does the political character of Jewish population statistics make every "official" publication of relative data suspect, but the signs of disintegration in the course of accelerated secularization and assimilation tendencies in East and West, plus the difficulty in obtaining reliable data on Soviet Jewry, burden every attempt to

²³ Schmelz, U.O. "A Guide to Jewish Population Studies," *Jewish Population Studies 1961-1968*, (U.O. Schmelz and P. Glickson, eds.). London/Jerusalem, 1970. p. 34.

²⁴ *AJYB*, 1980. Vol. 81, pp. 61 and 62.

trace the demographic development of world Jewry during the last 35 years.

Nevertheless, there is great unanimity that the USA, Israel and the Soviet Union together account for 80% of the world's Jews. The other fifth is composed of Jews in Europe, Latin America, South Africa, Australia and North African and Asian countries. No differences of opinion exist either on the generally largely urban character of world Jewry, and its much lower fertility than the surrounding gentile population. Only the Israelis register a healthy birth rate. In many countries – today probably in most – negative net growth rates replaced formerly small positive ones, and the trend toward assimilation and mixed marriages places a real question mark on the survival of the Jewish people outside Israel.

When looking into country-specific data, Zionist statistics suddenly become confused, even contradictory. Some Zionist experts insist on accepting the official Soviet statistics on Soviet Jewry (Schmelz), others are convinced that they underestimate the number of Jews in the USSR by 50% or more (Goldmann, Zand), while a third group prefers a figure somewhere in between (Shapiro). Keep in mind, in just this one case millions of people are involved, and the “Holocaust” story is affected directly by the final outcome of this controversy. As if this were not enough, some place the natural increase of post-war Soviet Jews at up to +1% p.a. (Shapiro), while others take it for granted that they actually suffered huge net growth deficits of up to –1% p.a. in part (Schmelz).

Similar inconsistencies could be listed for the United States, where the Jewish population was unscrupulously “reduced” to 5.4 million (1971: 6.1 million, and at the end of the war: 5 million), even though half a million Jews immigrated meanwhile as a matter of record, and the excess of births over deaths in the late 1940s, in the 1950s and in the 1960s added almost another million.

The way the *Year Book* sees the development of world Jewry since 1945 can be seen in *Table 22*. For the United States, whose Jewish population was listed much too low for 1946 already, one finds a drastic drop since the early 1970s. For the Soviet Union, whose Jews suffered drastic negative birth rates throughout the entire post-war period, a positive growth rate of 1% per year was applied until 1970. The other countries of the world purportedly lost only 0.7 million Jews between 1945 and 1970. This contradicts the fact that Israel and the United States alone received more than one million Jewish immigrants from there, and that the over-aged Jewish population remaining behind in Europe registered huge negative growth rates in part.

*Table 22: Purported World Jewish Population Development:
1945/46, 1970 and 1979 (in millions)
– according to the American Jewish Year Book –*

Country/Region	1945/46	1970	1979	Changes in % p.a.	
				1945-1970	1970-1979
United States	5.0	5.9	5.6 ^x	+0.7	–0.6
Soviet Union	2.0	2.6	2.6	+1.1	0
Palestine/Israel	0.6	2.6	3.2	+1.6 ^y	+1.5 ^y
	7.6	11.1	11.4 ^x	+1.5	+0.3
Rest of the world	3.5	2.8	2.7	–0.9	–0.4
World Jewry	11.1	13.9	14.1 ^x	+0.9	+0.2
<i>deduct:</i>					
Soviet Union	2.0	2.6	2.6	+1.1	0
World Jewry outside the Soviet Union	9.1	11.3	11.5 ^x	+0.9	+0.2

Source: *AJYB*, 1946, Vol. 48, p. 603-608; 1971, Vol. 72, p. 475-479, and 1980, Vol. 81, p. 285-289. Notes: ‘Excluding the non-Jewish members in the so-called “Jewish” households in the United States. J Refers only to the natural increase.

In an analysis published in the *Year Book*, the Israeli demographer Prof. U.O. Schmeltz from the Hebrew University in Jerusalem listed annual rates of natural increase or decrease for the following countries:²⁵

<i>Jewish Net Fertility Rates</i>		
Country	Period	Percent
United States	1967-71	0
Canada	1967-71	+0.2
Brazil (Sao Paulo)	1965-69	+0.3
Argentina	1956-60	+0.1
France (Paris):		
– European Jews	1972-76	–0.3
– Oriental Jews	1972-76	+0.2
Belgium (Brussels)	1957-61	–0.2
Germany	1961-65	–1.8
Switzerland	1959-62	–0.5
Italy	1961-65	–0.5
Soviet Union (RSFSR)	1959-70	–0.9
Israel	1971-75	+1.7

Since then, a further drop in Jewish fertility rates occurred in almost all countries of the world. Still, we should emphasize that at least in the United States and Canada the Jewish population developed more favorably in the first two decades after the war.

²⁵ *Ibid.*, pp. 68 and 69.

The above-mentioned Jewish growth rates in the individual countries correspond much more closely to the population changes as traced in this study than with those utilized by the *Year Book*. Our investigation, which is based largely on Zionist sources, showed that world Jewry was clearly less than 15 million in 1945 but exceeded 16 million just as surely in 1980. The extremely low fertility rates of world Jewry – Israel excepted – simply did not permit a faster growth. The probable development of the Jewish population, and the factors behind it – migration or fertility – have been recorded in *Tables 23* and *24*.

Table 23 shows that the 14.7 million surviving Jews multiplied by 0.4% annually between 1945 and 1970; but the smallness of the rise was almost exclusively due to the decrease of the Soviet Union's post-war Jewish population, whose losses of men in the ranks of the Red Army, untold deaths in Siberian labor camps, and multitudes of mixed marriages effected a drastically dropping birth rate. In the last decade – signs of this were visible in the 1960s already – the Jewish population of the Western World had no further growth, Israel excepted. One might even say that from here on world Jewry will grow only as much as Israelis overcompensate for the net deficits in the USSR – and this, too, is becoming ever more questionable, as Israel's excess of births over deaths begins to shrink and the deficit of the Jews in the USSR grows year by year.

*Table 23: Probable World Jewish Population Development:
1945, 1970 und 1979 (in millions)
– according to results of this study –*

Country/Area	1945			1970			1979		
		Natural growth	Migration		Natural growth	Migration		Natural growth in percent p.a.	
USA	5.2	+0.9	+0.5	6.6	0	+0.1	6.7	+0.6	0
USSR	4.3	–0.4	0	3.9	–0.3	–0.2	3.4	–0.4	–0.8
Palestine or Israel	0.6	+0.8	+1.2	2.6	+0.4	+0.2	3.2	+1.6	+1.5
Subtotal	10.1	+1.3	+1.7	13.1	+0.1	+0.1	13.3	+0.4	+0.1
Rest of world	4.6	+0.2	–1.7	3.1	0	–0.1	3.0	+0.2	0
World Jewry	14.7	+1.5	0	16.2	+0.1	0	16.3	+0.4	+0.1
<i>deduct:</i>									
USSR	4.3	–0.4	0	3.9	–0.3	–0.2	3.4	–0.4	–0.8
World Jewry outside the Soviet Union	10.4	+1.9	0	12.3	+0.4	0.2	12.9	+0.7	+0.4

Today, only Israel has a growing Jewish population, and until two decades ago this was also true in the United States. The Soviet Union and the group of the remaining countries in the world (within this group there were noticeable changes) registered a continually falling number of their Jewish population.

*Table 24: Distribution of World Jewry:
1945 and 1979 (in per cent)*

Country/Region	1945	1979
United States	35	41
Soviet Union	29	21
Palestine/Israel	4	20
Subtotal	69	82
Rest of the World	31	18
World Jewry	100	100
<i>deduct: Soviet Union</i>	29	21
World Jewry <i>outside</i> the Soviet Union	71	79

Source: *Table 23.*

The percentage distribution of world Jewry can be seen in *Table 24*. In 1945, the United States and Israel (Palestine) accounted for 40%, but today for more than 60%. In the Soviet Union – which contained more than one-third of world Jewry in 1940 – there were still almost 30% of the world’s Jews in 1945 despite the huge wartime losses of men and among the internees in Siberian labor camps. By 1980, this share had fallen to about 20%. A similar reduction in the share of Jews was recorded by the rest of the countries of the world: From 30% at the end of the war to about 20% in 1979/80.

While 80% of world Jewry today may be found outside the USSR, and of these, in turn, 80% in just two countries – USA and Israel – only time will tell whether or not this development really was a net gain for the once immensely fertile Eastern European Jewry. The Jews in the U.S. seem to have entered a phase of low, much too low fertility and assimilation tendencies, and the rapidly rising phenomenon of mixed marriages promises large losses for the future. Only in Israel did a young Jewish population persist. But here it is essentially the Oriental Jews who provide a healthy birth rate and who finally may shape the future and culture of this island nation in an Arabian sea – if the dams don’t break.

EPILOGUE:

Sanning Put to the Test

by Germar Rudolf

A New Hope

The present book is not about the Holocaust – that is at least what the author claims on page 192 of the present study. But that is more wishful thinking than reality. Of course, the core issue of the present study is the big elephant which is always present when Jewish demographic developments during World War Two are discussed: Many of the mystical Six Million Jewish victims are said to have died in the various homicidal gas chambers of the Third Reich’s camps, the largest and most notorious of which – with the highest claimed death tolls – are:¹

<i>Camp</i>	<i>claimed Jewish death toll</i>
Auschwitz	≈1,000,000
Treblinka	≈800,000
Belzec	≈600,000
Sobibor	≈250,000
Chelmno	≈150,000
Total	≈1,900,000

In addition to this, somewhere between 1,300,000 and 3,000,000 Jews are said to have been executed either by shooting or in so-called “gas vans” behind the German-Russian front.² Finally, victims of all kinds of atrocities, mistreatments and neglect in other camps and in ghettos are said to make up the bulk of the rest to reach the Six Million. Since, as indicated,

¹ Claims as to the actual death toll vary wildly. I have given the most widely accepted figures here. See the respective chapters in my book *Lectures on the Holocaust* (2nd ed., The Barnes Review, Washington, DC, 2010) for more details.

² On the “gas vans” see S. Alvarez, *The Gas Vans*, The Barnes Review, Washington, DC, 2011. On the *Einsatzgruppen*, which are said to have committed the majority of these murders, see C. Mattogno, *The Einsatzgruppen in the Occupied Eastern Territories: Genesis, Responsibilities and Activities*, 2. ed., Castle Hill Publishers, Uckfield, 2022.

all these numbers vary widely, pinning down how many Jews died under which circumstances and where is almost impossible.³

With all these variations going on, it should strike one as rather peculiar that the Six Million number itself is a seemingly invariable constant.

However, if one realizes that the emblematic number of Six Million suffering and dying Jews has been around since the late 1800s, that is to say: well before the outbreak of the FIRST(!) World War, as Don Heddesheimer was first to point out with a thorough study,⁴ then it might dawn upon the reader that we are dealing here not with a number arrived at with thorough demographic studies, but with a purely mythical symbol of political import.

Attempts at determining the Jewish death toll during World War Two are numerous, since every major work addressing this topic includes some kind of accounting.⁵ But until the first edition of the present work was published in 1983, no monograph dedicated exclusively to this topic existed, which is quite astounding, considering the importance of this issue.

How should one react to a book that proclaims that the Jews suffered a far lower death toll than Six Million during World War Two? Is such a message a reason to rejoice and hope, or a reason to become angry and to attack the messenger? The latter is no doubt the way many if not most people react – but why?

Everyone who insists with zeal that at least Six Million Jews must have fallen victim to Nazi persecution should examine their own motives for doing so. For shouldn't it be the normal reaction to find hope and comfort in the thought that fewer people died in a catastrophe than heretofore believed? The "Holocaust," however, is not a normal catastrophe. It comes with all the hallmarks of a religion, and questioning any detail of it, as Sanning does in the present book, inexorably provokes the ire of the devotees and high priests of the religion. Hence, when the present book was first published, expecting it to be welcome by the mainstream with exultation was too much to hope. Insults and *ad hominem* attacks against the author were more likely.

The first edition of the present book was honored by two mainstream historical periodicals with reviews, something which is nowadays quite unheard of for revisionist publications,⁶ although the quality of these re-

³ Thomas Dalton has shown this in his seminal *Debating the Holocaust*, 4th ed., Castle Hill Publishers, Uckfield, 2020, Chapter 4, pp. 75-98; and also in "The Great Holocaust Mystery: Reconsidering the Evidence," in: *Inconvenient History*, Vol. 6, No. 3, fall 2014.

⁴ Don Heddesheimer, *The First Holocaust*, 5th ed., Castle Hill Publishers, Uckfield 2018.

⁵ The earliest and at once most prominent ones being Reitlinger's *The Final Solution*, and Hilberg's *The Destruction of the European Jews*, ch. VIII, section 3.

⁶ John S. Conway, "History, Hitler, and the Holocaust," *The International History Review*, vol. VII, no. 3, August 1985, pp. 441-450, here pp. 450f.; Huttenbach, Henry R., *Martyrdom and Resistance*, vol. 11, Sept.-Oct. 1984, pp. 2, 12.

views was quite poor, as they merely contain unfounded suppositions and innuendoes rather than address any of the core issues at hand.⁷ However, since giving any credence or respect to iconoclastic, *i.e.* revisionist publications may cause a lot of trouble for anyone doing so, not much more could be expected.

That this book caused quite some discomfort in the ranks of the academic Holocaust orthodoxy can be gleaned from Henry Huttenbach's review:⁶

The danger of this book (and of those that will doubtlessly follow) is its clever veneer of scholarship. [...] Not one in a thousand undergraduates could find fault with it; only a few more graduates would be competent to identify its flaws and to convincingly question its credibility. The ultimate danger lies in the lack of a serious response to this continuing wave of attacks on history itself.

Hence, what had to be expected was the publication of a major mainstream monograph that would lay claim to refuting Sanning by proving "once and for all" that Six Million Jews died during the Holocaust indeed.

The Empire Strikes Back

And so it happened: Eight years after Sanning had presented his research results to the Anglophone and German publics, the German official Institute for Contemporary History (*Institut für Zeitgeschichte*) published an impressive 584-page study titled *Dimension des Völkermords* (Dimension of the Genocide). It is an anthology consisting of 17 individual contributions (plus the editor's introduction), each written by an expert⁸ in the field of Jewish demography for a particular European country that fell under the influence of Nazi rule at any point between 1933 and 1944. The editor of this anthology, Dr. Wolfgang Benz, at that time Professor for Research of anti-Semitism in Berlin, summarized the results of this study as follows:⁹

The bottom line indicates a minimum of 5.29 and a maximum of just over 6 million [Jewish victims of the Holocaust].

⁷ See Dan Desjardins's "Critique of John S. Conway's Review," *The Journal of Historical Review*, vol. 7, no. 3, 1986, pp. 375, 379; see also the exchange of letters by W. D. Rubinstein – making similar unfounded accusations – and W. N. Sanning as well as A. R. Butz in response, *The Journal of Historical Review*, vol. 5, nos. 2-4, 1984, pp. 367-373.

⁸ I am not sure what makes those contributing authors experts in demographics, but I take it that, by studying their subject in depth, they at least have *become* experts during the course of their preparatory research. 16 of the 18 contributing authors have a PhD title, and six of them are professors.

⁹ W. Benz (ed.), *Dimension des Völkermords*, Oldenbourg, Munich, 1991, p. 17.

Needless to say that Benz forestalls any suspicions by denying that the purpose of the demographic research project coordinated by him had been “to prove any pre-set figure (‘six million’),”¹⁰ although that is inevitably the impression one gets.

Now, 584 pages of thorough research by 18 expert authors should spell doom for the slender 200-page book written by the lone-wolf author Walter N. Sanning aka Wilhelm Niederreiter. But both books cannot be compared, really. While Sanning focused exclusively on demographic statistics and ignored everything else, like anti-Jewish measures implemented in various countries and the alleged means, locations and numbers of mass murders perpetrated, Benz *et al.* present elaborate peripheral matters for their readers. Each one of their contributions starts out with a summary of the history of the Jews in the country under discussion, and then gives a detailed account of all the anti-Jewish laws, measures and events that took place there. The size of Benz’s book is thus no indication of its statistically relevant contents, nor is that of Sanning’s indicative of any deficiency.

But what about the part of Benz’s book which does address statistical issues? Does it refute or even address Sanning’s claims?

The first surprising fact of Benz’s anthology is that Sanning’s book is mentioned only by one author, and then only in a footnote almost at the very end of the book. There one reads:¹¹

“The author [Sanning] distinguishes himself through his methodologically unsound handling of the statistical material as well as through daring and demonstrably erroneous reasoning and conclusions.”

The huge discrepancy between the works’ final death toll make it seem obvious that this had to be this anthology’s conclusion, if not already its starting hypothesis. However, the reader’s hope to find out in which way Sanning handled the statistical material wrongly and why his reasoning and

Prof. Dr. Wolfgang Benz, a life spent researching anti-Semitism

¹⁰ *Ibid.*, p. 20.

¹¹ Gert Robel in his paper on the Soviet Union, in: W. Benz, *op. cit.* (note 9), p. 558, footnote 396. The book has 560 text pages.

conclusions are erroneous is disappointed. All that is provided in Benz's book is the above mere claim with nothing to back it up.

Again, it is absolutely imperative for mainstream historians not to grant revisionists even a semblance of respect, so they hardly, if ever, quote revisionist works, let alone discuss any of their claims, reasoning and conclusions. If revisionist works are mentioned at all, then usually only in mere passing with unfounded derogatory remarks and often even with invectives against their authors, although the latter can fortunately not be found in Benz's work. Hence nothing more than this footnote could be expected from these "reputable" scholars.

What one has to expect, though, is at least a "serious response" to Sanning's contested claims, as Prof. Huttenbach had demanded – if only implicitly by refuting them without repeating or mentioning them – so that serious students of history may be equipped with the tools they need in order to see through the alleged web of lies spun by revisionists like Sanning.

The Return of the Jedi

When I learned about the existence of Benz's anthology in 1992, I had to find out whether it contained powerful arguments which could refute Sanning's hypotheses. I read both books in parallel and made notes along the way pertaining to the population data each book provides for each country, as well as how and why they differ, if at all. After finishing my survey, I used this data to write a paper which I planned on publishing in a revisionist anthology edited by me at that time.¹² I sent an early version of this paper to Herr Niederreiter (aka Sanning), asking him for his comments. Unfortunately he had suffered a stroke a short while before this, so he managed to send me only a few comments. Mr. Niederreiter passed away shortly afterwards. My paper comparing Sanning's and Benz's works was therefore published without major changes. The following is a brief summary of the most important of my findings.

On the positive side, Benz's book impresses with its richness and thoroughness of the statistical source material used by each author analyzing a certain country. Most authors obviously had full access to the archival resources of the countries they were investigating. In this regard, Benz far excels Sanning, who had to make do with far less material.

¹² G. Rudolf, "Statistisches über die Holocaust Opfer – W. Benz und W.N. Sanning im Vergleich," in: Ernst Gauss (ed. = Germar Rudolf), *Grundlagen zur Zeitgeschichte*, Grabert, Tübingen 1994, pp. 141-168; Engl.: "Holocaust Victims: A Statistical Analysis · W. Benz and W. N. Sanning – A Comparison", in: G. Rudolf (ed.), *Dissecting the Holocaust*, 3rd ed., Castle Hill Publishers, Uckfield, 2019, pp. 175-206.

On the downside, the editor Wolfgang Benz did a bad job coordinating the work of each author involved in the project. Since the borders of many countries in Europe shifted considerably during and after the Second World War, it would have been mandatory to agree up front on certain borders, so that no area where sovereignty changed during the investigated time span is left untreated or is counted twice or even multiple times. Because this was not done, 533,193 alleged Holocaust victims were counted twice.

The result of a country-by-country comparison of Benz's and Sanning's data for the countries which in some way came under German influence during World War Two is given in *Table 25*. It reveals that, by and large, the data both books come up with are relatively similar in most cases. Really decisive differences of more than 100,000 missing persons exist only in three cases highlighted in italics: Hungary, Poland and the Soviet Union.

Sanning's figure for Hungary is based on the assumption that only few Hungarian Jews were deported to German labor camps in the spring and summer of 1944, while mainstream historiography insists that some 400,000 Hungarian Jews shared that fate. Sanning bases his assumption on arguments first brought forward by Arthur Butz.¹³ Butz's thesis, in turn, has been challenged even by revisionists,¹⁴ and in a 1993 letter to me, Mr. Niederreiter indicated that he changed his position in this regard and assumes that several hundred thousand Hungarian Jews were indeed deported to Germany in spring/summer 1944 – although for forced labor rather than for wholesale slaughter, as orthodox historiography claims.

This leaves us with only two countries where Sanning and Benz profoundly disagree: Poland and the USSR. Hence, the core of the issue lies in the fate of the Jews of these two countries.

Digging deeper into Benz's anthology, I revealed another way the Holocaust figure is inflated by it. This time it is not a matter of incompetence, but one of premeditation. It is based on the highly dubious method applied by Benz and his colleagues to ascertain the death toll for each country. This method is basically based upon a simple difference between pre-war and post-war population sizes.¹⁵ All of the following reasons why the num-

¹³ See Chapter 5 in Butz's book *The Hoax of the Twentieth Century*, 4th ed., Castle Hill Publishers, Uckfield, 2015, pp. 181-229.

¹⁴ Jürgen Graf, "What Happened to the Jews Who Were Deported to Auschwitz But Were Not Registered There?," *The Journal of Historical Review*, vol. 19, no. 4, July/August 2000, pp. 4-18.

¹⁵ That flawed approach was also recognized by German historian Prof. Dr. Ernst Nolte in an expert report (in: Germar Rudolf, *Resistance is Obligatory*, Castle Hill Publishers, Uckfield, 2012, p. 278):

Wolfgang Benz [...] in fact proceeds from the premise worthy of critique that one could be able to determine the number of victims of the National Socialist measures of extermination by comparing the number of Jews in statistics before and after the Second World War."

Table 25: Country-by-Country Comparison of Benz and Sanning

NATION	VICTIMS, BENZ – REDUCED BY DUPLICATE COUNTS	MISSING, SANNING
Germany	139,000	123,000
Austria	48,767	36,000
Luxembourg	1,200	
Belgium	28,518	Total: 124,500
France	76,134	
Netherlands	102,000	
Denmark	116	Total: 1,000
Norway	758	
Italy	5,914	9,000
Albania	?200	0
Greece	58,885	53,000
Yugoslavia	60,000	56,000
Hungary	277,000	71,000
Czechoslovakia	164,000	112,000
Romania	107,295	3,742
Bulgaria	0	-7,600
Poland	1,800,000	516,511
Soviet Union	2,890,000	15,000
TOTAL	5,759,785	1,113,153

ber of Jews in a country could have been reduced were simply lumped together as *German* Holocaust victims:

- death due to Soviet deportation and imprisonment
- death as partisan (battle or execution)
- death as soldier/killed in combat
- death due to pogroms by non-Germans, without German collaboration or sanction
- death due to effects of war (labor service, bombing victims)
- natural excess of deaths over births
- religious conversions
- unregistered emigration during and after the war
- Jews not statistically registered or identified as Jews today

The first point is particularly important in this context, since one of Sanning's emphases is on the fate of Jews under Soviet rule. In Benz's anthology, on the other hand, all these many complex issues are basically ignored. Symptomatic for this is the following statement by Prof. Dr. Gert Robel, author of the contribution on the Soviet Union, about the reasons for the demographic decline of Soviet Jewry:¹⁶

¹⁶ Gert Robel in his chapter on the Soviet Union, in: W. Benz, *op. cit.* (note 9), p. 560.

It [the number of Jewish Holocaust victims in the USSR] also includes the casualties among Jewish soldiers and civilians [partisans] as well as those who succumbed to the strain of flight and to starvation.

This is justified. They too were victims of violent National Socialist policies.

Robel neither quantifies these categories, nor does he give reasons for this catch-all approach, for these are the closing words of this book. This is a convenient sleight of hand, though, as it puts the blame for all of Stalin’s wartime victims squarely on Germany’s shoulders and thus relieves Robel from the potentially unrewarding duty to conduct any in-depth investigation into the scope and scale of Soviet deportations and evacuations. If all casualties caused by the war are Germany’s fault, and if therefore all Jewish casualties count as German Holocaust victims, then why bother looking into how, where and in whose hands they died?

It is therefore not surprising that Robel doesn’t bother getting involved in this issue. Hence, regarding the all-decisive topic of Soviet evacuations and deportations immediately prior to and after the outbreak of the Russo-German war, Robel suggests merely that there are no systematic accounts of their extent and scope. He dismisses this very important aspect in merely two paragraphs with the comment that Stalin did not wish to provoke Hitler with evacuation activities, and that there were therefore hardly any noteworthy deportations.¹⁷ This claim is backed up with – nothing.

In contrast to this, Sanning devoted four entire chapters to the subject of Jews under the rule of the Soviet Union, with two of them focusing on Stalin’s mass evacuations and deportations.

As for Poland, Benz’s and Sanning’s opposing positions can be summarized as follows:

Table 26: Polish Jewry acc. to Benz and Sanning

	Benz	Sanning
1931 population	3,100,000	3,100,000
pre-war fertility	high (1.4% p.a.)	low (0.2% p.a)
1931-1939 emigration	100,000	500,000
pre-war population	3,350,000	2,664,000
fled to Russia/Rumania in 1939	300,000	850,000
German-occupied western Poland (late 1939)	2,000,000	760,000
For details and page numbers see my study mentioned in footnote 12.		

¹⁷ *Ibid.*, p. 507.

While Sanning devotes roughly 20 pages of intensive and thoroughly documented analysis to the problem of the demographic development of Polish Jewry in the years 1931-1939, Benz's Poland author Prof. Dr. Frank Golczewski deals with this important issue in only two sentences:¹

"[...] if we extrapolate the census figures [of 1931], taking into account natural increase and emigration, we arrive at a 1939 total population of 35,100,000 persons for the Polish nation as a whole, of which the Jewish component is estimated at 3,446,000. We repeat: these figures are not certain [...]"

Dr. Frank Golczewski, Professor for Modern History, Munich

Golczewski simply assumes, without even making the slightest effort to investigate this topic, that the highly urbanized and persecuted Jews had the same growth and emigration rates as the rural Christian Poles.

The same guesswork is involved when Golczewski deals with the eastward mass flight of the Jews at the outbreak of the war. His figure is simply based on estimates, claiming that there are no reliable figures.² Even though that may be true, estimates can still be based on circumstantial evidence as presented by Sanning, but Golczewski decided to simply ignore them and conjure up some figures out of thin air.

As bad as all this sounds for Benz, it gets worse still, because the real Achilles' heel of Benz's anthology isn't even his ridiculously superficial and incompetent treatment of Polish and Soviet Jewry. The biggest flaw of Benz's book is that it does not contain *even a single paragraph* on the problem of Jewish post-war emigration from Europe. It does not even *mention* that there was a large-scale migration after the war, especially of the European population of Jewish faith, which has become known as the modern Exodus (as celebrated, for example, in the name of the iconic 1960 movie starring Paul Newman)!

The first ten chapters of Benz's anthology are conspicuous in their lack of *any* mention of post-war emigration, while others (Greece and Yugoslavia) fashion a fig-leaf for themselves by admitting to a few hundreds or thousands who left the country after the war's end.

¹ Frank Golczewski in his chapter on Poland, in: W. Benz, *op. cit.* (note 9), p. 417.

² *Ibid.*, pp. 425f., 443.

Hence, exactly in the areas where Sanning's work impresses – mainly the fates of Jews in Poland and in the USSR as well as the Jewish Exodus during and after World War Two – Benz is completely and utterly silent.

One important characteristic of a scholarly work is that it mentions and addresses the arguments raised by other works in this area. Since Benz's anthology appeared eight years after Sanning's monograph, it would have been absolutely imperative to mention and thoroughly discuss Sanning's arguments. But Benz and his colleagues decided to do the exact opposite. Not even implicitly did they mention, let alone address, a single one of Sanning's arguments. Hence, Benz's work fails the litmus test of being a scholarly work. It's a botched, politically driven job of paid flacks hell-bent on proving the veracity of the Holy Six Million figure – despite Benz's claim to the contrary.

Hence, readers expecting to find answers in Benz's voluminous work to nagging questions and doubts instilled by Sanning's book will walk away disappointed and empty-handed.

This may also be the reason why no English translation of Benz's book has ever been published in the 24 years after it first appeared in German.

Since there do not seem to exist in the public domain any arguments refuting Sanning's hypotheses and conclusions, we have decided to issue this essentially unchanged new edition of Sanning's classic work on Jewish wartime demographics with an updated preface by Arthur Butz. Only several typos were corrected, and I also translated the few German words contained in several tables which the original translator and editor had apparently overlooked.

Therefore Sanning returns herewith, unchanged, unbowed, and unchallenged.

Sanning – Swedish for: truth, veracity, realism, exactitude, precision

UPDATE:

New Findings

*1.5 Million Jewish Emigrants Overseas
from the “Area of Jewish Misery in Europe” (1925-1939)*

The American Chief Prosecutor Robert Jackson had stated during the International Military Tribunal in Nuremberg (IMT, Vol. 2, p. 119):

“Of the 9,600,000 Jews who lived in Nazi-dominated Europe, 60 percent are authoritatively estimated to have perished. Five million seven hundred thousand Jews are missing from the countries in which they formerly lived, [...]”

Both figures are wrong! And he completely forgot about the Soviet rule! In truth, at the end of 1939 – after the German-Soviet partition of Poland – there were at most 3.4 million Jews in the non-Soviet former “Nazi-dominated Europe” (June 1941: 2.8 million Jews) and 4.9 million Jews in the areas of Europe and Asia under Soviet rule. In June 1941: 5.3 million Jews, the majority of whom were then deported to Siberia and the Urals together with up to 35 million Russians, Ukrainians, Byelorussians, Russian-Germans, Balts, Poles, Tatars, etc. – before and after the outbreak of the German-Soviet war!

According to my research, never more than about 3.5 million Jews were in the German sphere of influence, rather less. The “disappearance” of 5.7 million Jews can also be explained (see Table 29).

35 years ago, my *Dissolution* was published in Germany and in the United States. In the meantime, new sources and contexts have emerged, and unforeseen events have occurred that confirm my account. For ease of reference in this update, the tables reflect Jewish population figures as listed in *The Dissolution*.

Poland, Germany, Romania and the Baltic States – where nearly five million Jews still resided at the beginning of the 1930s – pursued policies decidedly hostile to Jews, especially the first two nations. This was compounded by economic depression. The result was economic impoverishment of the Jewish population, especially in Poland.

The only possible solution for them was emigration: in the years 1931 to 1939, more than 500,000, probably 600,000 Jews emigrated from Poland, more than 400,000 from Greater Germany (1933/1934 to 1939) (including the Protectorate), 100,000 from Romania and about 25,000 from the Baltic States; but there was also Jewish emigration from Hungary (and probably from Slovakia). The Zionist-friendly Institute of Contemporary History (*Institut für Zeitgeschichte*, Munich) has affirmed this since 1958:¹

“The wave of emigration of German Jews was only a part – and not even the largest one at that – of a general Jewish emigration from central, eastern and southeastern Europe. In the years following 1933 about 100,000 Jews left Poland every year, partly because of the increasingly anti-Semitic policies of the Polish government, but also because of the progressively worsening pauperization of the Polish Jews. Similar tendencies existed in Latvia, Lithuania, Rumania and, to a lesser degree, in Hungary.” (My emphasis)

These Jewish emigrants from Central or Eastern Europe went mainly to the USA. In this regard, Assistant Secretary of State Breckinridge Long stated in November 1943 that the U.S. had taken in 580,000 “victims of persecution” in the previous ten years; most of them were Jews (only 100,000 of them were German Jews). Palestine had nearly 300,000 Jewish immigrants. Latin America and Western Europe also absorbed a few 100,000 Jews. The countries of the British Empire (such as Australia, Canada, South Africa, etc.) likewise had a few 10,000 Jews immigrate.

As a result of the brief German-Polish conflict, Poland or the General Government, Germany (including the Protectorate), Romania, the Baltic States, Hungary, and Slovakia had lost three million Jews by the end of 1939 through birth deficits, border changes, emigration, and flight, while the Soviet Union gained two million Eastern Jews through annexation and Jews fleeing from the Germans out of Western Poland (see Table 27). So much for my book *The Dissoluton*.

But already 16 years before 1958 – in 1942 – did the *Universal Jewish Encyclopedia* report the same thing: a large Jewish emigration had taken place from Eastern and Central Europe to overseas from the mid-1920s to the end of the 1930s:²

“With the passage of the 1924 Immigration Quota Law by Congress and the necessity of exploring the possibilities for immigration to other

¹ Hermann Graml, “Die Auswanderung von Juden aus Deutschland zwischen 1933 und 1939”, in: *Institut für Zeitgeschichte* (ed.), Vol. I, p. 80.

² *Universal Jewish Encyclopedia*, New York, Vol. 7, 1942, pp. 555f.: article headlined “Migrations of the Jews”, Section V “The Care of the Migrants Through Jewish Organizations”, Point 2. “The Hebrew Sheltering and Immigrant Aid Society (HIAS)” by Isaac L. Asofsky; he was general manager (since 1922) and then director of the HIAS during WWII.

of the world, HIAS sought to strengthen and enlarge its activities abroad. In 1927, it entered into an agreement with the Jewish Colonization Association (ICA) of Paris, France, for the purpose of forming what has since become known as HICEM, the abbreviated name for the HIASICA Emigration Association. This association with headquarters in Paris, and branch offices in thirty-two countries of emigration, transit and immigration became the European arm for a world-wide immigrant and refugee service. In the period between 1925 and 1939, an average of 100,000 Jewish men, women and children emigrated from the area of Jewish misery in Europe each year. In consequence of this effort, hundreds of thousands of Jews had been helped to settle not only in the United States, but in the dominions of the British Empire, in the Far East, in South and Central America, and in Palestine.” (My emphasis)

By “area of Jewish misery in Europe” was meant: Central and Eastern Europe, especially Poland, but also National-Socialist Germany including the Protectorate, Romania, the Baltic States, Hungary and Slovakia; this is certainly exactly how the Munich Institute of Contemporary History sees it. The Western-European immigration and transit countries as well as the Soviet Union, which was officially friendly to Jews, are ruled out in this respect.

In all these years, to my knowledge, this statement of the *Universal Jewish Encyclopedia* has never been disputed by the Zionists. Too bad Mr. Jackson did not seek the *Universal Jewish Encyclopedia*; otherwise he would not have made this mistake that there were 9.6 million Jews living in Europe when he drew up the indictment.

Therefore, the *Eastern Jewish* emigration of 1.5 million from Central and Eastern Europe between 1925 and 1939 took place within the framework of *a general, more-or-less organized emigration* from Poland, Germany, Romania, in the Baltic States, etc. Thus, the Jewish population figures in the early 1930s in the emigration countries in Central/Eastern Europe (excluding the USSR) and in the immigration countries such as the USA, South America, Palestine, etc. are only of historical interest; *the Jewish population figures of the early 1930s have no relation to the reality of 1939, let alone 1940/41 or 1945!*

The Polish census of 1931 already reveals a sudden Eastern-Jewish decline in births since 1925; a loosening of family ties or a change in religious beliefs alone cannot explain the large losses: the number of births simply declined too quickly and too sharply. The enormously high emigration would be one explanation. Between 1931 and 1939, Poland had a Jewish population loss of 20%. This must have had a downright devastating effect on the number of births, because it is always the younger, more fertile

segments of the population that are most likely to leave. No wonder that the *Universal Jewish Encyclopedia* lamented:³

“But even in Eastern Europe the birth rate was falling, and began to approach that of Western Europe.”

and the latter was already lower than the death rate.

Another indication of a fertility crisis is the “child-to-woman ratio”.⁴ In 1925, the Eastern Jewish “ratio” in Poland may still have been between 600 and 650; tendency: slightly decreasing over generations. Then, in the period of only six years – i.e. from 1925 to 1931 – it dropped to 455(!) (for non-Jews the “ratio” in 1931 was 650);⁵ however, 500 is necessary for maintaining the population. Given the huge wave of Eastern Jewish emigration in the 1930s, caused by ever-increasing economic impoverishment and a government hostile to Jews, one must assume that this “child/woman ratio” for 1939 was well below 455 (perhaps as low as 200-300) and that there was, on average, a slight birth deficit among Poland’s Eastern Jewish population in the 1930s.⁶

The *Universal Jewish Encyclopedia*’s account is completely congruent with *The Dissolution* published 35 years ago; the Jewish population had fallen from over nine million in the 1930s to about eight million in 1939 in what later became German- or Soviet-occupied Europe (see Table 27 under A.).

The Jewish Missing Persons in the Second World War

Shortly after the Second World War, more than half a million Jews were on German soil, mainly in the U.S. zone of occupation. But what was their nationality? No one knows. Where did they come from? To this day, almost nothing is known about it.

During a press conference in Frankfurt on Main on Jan. 2, 1946, British General Sir Frederick E. Morgan, head of UNRRA operations in Germany,

³ *Universal Jewish Encyclopedia*, Vol. 10, p. 33.

⁴ See the present study on pp. 47f.

Stosunki Zawodowe; Główny Urząd Statystyczny Rzeczypospolitej Polskiej, Statystyka Polski, Warszawa 1937 (*Deuxième Recensement Général de la Population du 9 Décembre 1931*; Logements et Ménages, Population, Profession. Pologne (données abrégées). Office central statistique de la République Polonaise, Statistique de la Pologne.

⁶ *A Correction for The Dissolution*: In my opinion, based on recent figures, the Jewish population of Poland in 1939 must have been less than 2.5 million (1931: 3.1 million). The increasingly anti-Jewish attitude of the Polish government and the ever-increasing economic impoverishment of the Polish-Jewish masses led to the enormously high emigration (1931-1939; erroneously, the IfZ report spoke only of “the years after 1933”); at the same time, the birth deficits (1931-1939), which soon set in, and the war losses (1939) added to this. Therefore, a correction of the *Dissolution* is essential.

decried “the exodus from Poland,” by which large masses of Jews were smuggled into Germany from the East, of being “a vast plot, engineered by an unknown secret Jewish organization.” He said that they do not “look like a persecuted people” and that all of them were “well-dressed, well-fed, rosy-cheeked and having plenty of money.”⁷ U.S. Historian Dr. Raul Hilberg also stated:⁸

“In Poland, Czechoslovakia, and Hungary many Jews chose to not wait; they decided to embark upon their journey [...] From Poland the exodus began through Czechoslovakia to the American zone in Germany. From Hungary and even Roumania, the Jews began to arrive in Austria. By November 1945, the flow was beginning to thicken, and thousands of refugees were spilling over into Italy.”

Yet *The Dissolution* cited 400,000 Jewish DPs (Displaced Persons) in 1947; this figure comes from the *New York Times*.⁹ So Much for my book *the Dissolution*.

But even before that, the *American Jewish Year Book 1946-1947* (AJYB) reported:¹⁰

“By the end of January [1946] the flow of [Jewish] refugees into the American zone reached such proportions that it was estimated more than 600,000 persons would be interned in displaced persons camps by March.”

In addition, there were the Jewish DPs in the British, French and Russian zones (numbers unknown), 35,000 in Austria and 30,000 in Italy.¹¹ That already amounts to 700,000 Jewish DPs. Nobody knows where these Jewish DPs went. I had hoped to learn a little more about their whereabouts and nationality in the following issue of the *AJYB*; but I found myself sadly disappointed. The Jewish refugees had disappeared from the face of the earth!

How large was this flood from 1945 to 1947 really? It is widely known that the vast majority of Jews interned in German concentration camps did not return to their homelands at the end of World War II; yet there is conspicuously little, if anything, about this in the works of the orthodoxy –

⁷ *AJYB* 1946-1947; Vol. 48, p. 302: “Lieutenant General Sir Frederick E. Morgan, chief of UNRRA operations in Germany, in a press interview on January 2, 1946, charged the exodus from Poland was a vast plot, engineered by an unknown secret Jewish organization. Sir Frederick said that he was not at all convinced by the talk of pogrom in Poland and that the people he had seen flocking into Berlin did not ‘look like persecuted people.’ They were, he said, ‘well-dressed, well fed, rosy-cheeked and have plenty of money.’”

from Reitlinger (*The Final Solution*) to Benz (*Dimension des Völkermords*). Well, in the meantime, new figures about these Jewish DP's and escapees – that is, the “missing” – have come to light from well-known Jewish personalities and organizations.

Dr. Nahum Goldmann, long-time president of the World Jewish Congress, should be well acquainted with the Jewish drama; he wrote in his book *Das jüdische Paradox* in 1978(!):¹²

“But in 1945, there were up to six hundred thousand Jewish concentration-camp survivors which no country wanted to accept; this is [...] a historical fact.”

Jon and David Kimche report in their book *The Secret Roads* (1954):¹³

“[...], some 800,000 homeless [Jewish] refugees rotting in the grey slum-camps of Europe, [...]” (1945/46)

Their only wish was to get out of Europe.¹⁴ The difference between 600,000 (Goldmann 1945) and 800,000 (Kimche 1945/46) are apparently the repatriates from the Soviet Union (157,000).

David Kimche is not just anyone; this Israeli secret agent was a leading Mossad operative. Since Mossad was a leader in getting Jews out of the German sphere of influence, he is also familiar with the Jewish refugee drama.

The Israeli intelligence agency Mossad was responsible, among other things, for Jewish emigration to Israel from countries where official *Aliyah* agencies were banned, and generally for the protection of Jewish communities worldwide. Although Mossad was officially established only on 13 December 1949, it was unofficially created in 1937 as *Mossad le Aliyah Bet*, Committee for Illegal Immigration (Exodus!), in Tel Aviv by union leaders and the Haganah (underground resistance fighters).

Mossad agents were all over Europe and the Middle East, and they succeeded in transporting a good 100,000 Jews illegally to Palestine. The Jewish refugees came from Holland, Sweden, France, Yugoslavia, etc., but especially from Romania: ships regularly left for the Levant. The ships *Amiram*, *Assipa*, *Astir*, *Atlantic*, *Bulbul*, *Dalin*, *Dora*, *Enzo Sereni*, *Exodus*, *Fede*, *Fenice*, *Haim Arlosoroff*, *Hannah Senes*, *Hatikva*, *Henrietta Szold*,

¹² Nahum Goldmann, *Das jüdische Paradox-Zionismus und Judentum nach Hitler*, Europäische Verlagsanstalt, Cologne 1978, p. 263.

¹³ Jon and David Kimche, *The Secret Roads – The “Illegal” Migration of a People 1938-1948*, London 1954, p. 175:

¹⁴ *Ibid.*, p. 78: “A burning, bitter, all-consuming hatred drove the Jews of Eastern Europe. They hated the Germans who had destroyed their corporate life; they hated the Poles and Czechs, the Hungarians and Rumanians, the Austrians and the Balts who had helped the Germans; they hated the British and the Americans, the Russians and the Christians who had left them, so it seemed to them, to their fate. They hated Europe, [...] they owed nothing to its peoples. They wanted to get out.”

Hilda, Josiah Wedgwood, Karbeh, Katriel Yaffe, Maria, Maritza, Max Nordau, Mefkure (sunk), Melavim, Meret Hageetaot, Milka, Milos, Pacific, Pan Crescent, Pan York, Patria (sunk), Petro, Salvador (sunk), Shaar Yishuv, Shabbtai Lujinski, Struma (sunk), Tel Hai, Tiger Hill, Torus, Yagur and many more transported tens of thousands of Jews from Europe to Palestine during the war and shortly thereafter.¹⁵

Moreover, the Institute of Jewish Affairs (IJA) reported in 1943 that 180,000 Jews escaped from the German sphere of influence from the beginning of the war until mid-1943.¹⁶ Extrapolated to the full year 1943, one would have to assume that a few tens of thousands more Jews escaped. Let us say 225,000 for the years 1941 to 1943.

The War Refugee Board (WRB) created by U.S. President Franklin D. Roosevelt in January 1944 brought 200,000 Jews outside the German sphere of influence to safety by 1945.¹⁷ Certainly among them were some of the Western European Jews transported to Russia and/or the Soviet citizens who stayed behind.

Accordingly, Jon and David Kimche have reported that during the war period 300,000 Jews left Europe, and a good 100,000 Jews moved to Palestine, despite energetic [German] resistance.¹⁸ In addition, there was the HICEM (1927-1940 Paris; 1940 Lisbon). With its help, 90,000 Jews left Lisbon on neutral Portuguese ships by 1945.¹⁹ Some of this is double counting, I assume (see Table 28 under B. 1945 “Missing Persons” {[A], [B]}).

The majority of the – rediscovered – “missing persons” (about 1 million) belong of course to the “Holocaust survivors” or “1946/1948 survivors”. But one does not recognize whether they were Polish, German, Dutch, etc. Jews. Poland, for example, is said to have had only 83,000 “Holocaust survivors”; in reality, however, there were many more. The figure concerns only Jewish “Holocaust survivors” registered in Communist Poland; but in the U.S. zone of occupation in Germany, there were also Polish Jewish survivors who had not been registered in Poland, as Dr. Raul Hilberg tells us. How many more? 100,000 or 500,000? The answer to these questions is known only to a small circle of Zionists who have access to this data. But they do not tell us. Dr. Nahum Goldmann was one of them.

¹⁵ *Ibid.*, pp. 25ff.

¹⁷ U.S. Holocaust Memorial Museum, Washington, D.C., *The War Refugee Board*, (Internet).

¹⁸ Jon and David Kimche, *The Secret Roads*, p. 171: “[...] succeeded in directing a stream of 300,000 Jews across Europe and in transporting well over 100,000 to Palestine in the face of such strenuous opposition.”

¹⁹ Shoah Resource Center, The International School for Holocaust Studies, HICEM; (Internet). “[...] helped them [refugees] leave Lisbon neutral Portuguese ships. In all, some 90,000 Jews managed to escape Europe [...]”

Or consider Germany or Austria: only 36,000 Jewish “Holocaust survivors” are said to have been counted there in 1947; in Germany, Reitlinger says, 19,000 Jews remained at large throughout the war, and another 8,000 are said to have migrated back from the various concentration camps after the collapse. If the situation was similar in Austria with its 9,000 “surviving” Jews in 1947, then approximately 10,000 Jews from the various German concentration camps would have made their way to freedom. That is 1% of the “surviving” Jews (600,000 for Goldmann and 400,000 for Kimche). Is this credible? Hardly. But where did the German or Austrian Jewish refugees go who are contained in the 600,000-figure that Dr. Nahum Goldmann tells us about? These Jewish refugees present in the U.S. occupation zone in Germany were counted, after all – by the U.S.-controlled UNRRA, which never published its data. Or were they perhaps among Kimche’s 400,000 Jews who fled Europe or who settled in Palestine during the war period? We don’t know! Again, only a small circle of Zionists know.

Or consider the Western European countries (France, Italy, the Netherlands and Belgium). According to Reitlinger’s *Final Solution*, 212,000 Jews were deported from these countries; according to him, only 11,000 returned home after the war. Can we conclude from this that the 201,000 did not come “home”? Not at all! Most of them found a non-European “home”! However, the Polish, Western and Central European “Holocaust survivors” of 1946/48 form only a very small part of the “concentration camp survivors and escaped Jews” of 1945 – only one tenth of the claimed number of survivors; and the rest? The nationality of the individual Jews remains a secret – because of the Zionists’ refusal to reveal country affiliations. But I believe that they make up the biggest part of the “concentration-camp survivors and escaped Jews” of 1945! A concession by the Zionists on this issue could bring many a surprise.

There is a reason why the Jewish “Holocaust survivors” of the individual countries were given only for 1946/48: The relocation of the Jewish refugees from the U.S. occupation zone in Germany to the USA, Latin America, Palestine/Israel and elsewhere was largely completed in 1948.

However, the facts became only gradually known that in the meantime 600,000 Jewish concentration camp prisoners from the German camps and 157,000 Jewish concentration camp prisoners from the Soviet camps reached the U.S. zone, and that 400,000 Jews from the various German camps escaped during the war through an organized flight to Palestine and overseas.

It is a fact, however, that about a million more Jews survived in the sphere of influence of the “Nazis” than indicated in the “official 1946/48 survivors” statistics; the DPs and escaped persons – called “missing per-

sons” by me – (Goldmann’s 600,000 concentration camp survivors and Kimche’s just over 400,000 escapees) were simply “overlooked” by Mr. Jackson. Except for a lamentable few hundred thousand Jewish dead (epidemics, starvation, forcible transports, etc.), this should mostly solve the question of survivors, especially Polish, German and Western European Jews.

It is also not known which countries finally absorbed them, exactly how many there were, from which concentration camps or ghettos they came, etc. These are all questions of burning interest to us. The Zionists know the answers to these questions through UNRRA, whose directors had been the New York Zionists Herbert Lehman and Fiorello LaGuardia. But they did not tell us. Only here and there are hidden hints!

Today, no one talks about these approximately 1 million formerly “missing” Jews. And yet, after the war, most of them were in Germany for a short time, for the most part in the U.S. zone of occupation (Kimche, Morgan, Hilberg, Goldmann, *American Jewish Year Book*) or they had fled to other countries during the war (Kimche, Institute of Jewish Affairs, War Refugee Board, HICEM). The vast majority are not listed in any survivor statistics! I have a terrible feeling: these 1 million “missing” Jews, attested to by Dr. Goldmann and Kimche, have – oh, what perfidy – been turned into “Holocaust victims”, although they survived, probably in the New World, i.e. in the USA!

By the way, I wrote at that time (1983) in *The Dissolution* (Chapter 7, subtitle “The ‘Missing’”) that there were about one million “additional [Jewish] survivors in, and/or emigrants from, former German-occupied Europe” (exactly, according to my knowledge at that time, there were 965,000 missing Jews; see S. 172 and Table 21, p. 195); only I lacked direct evidence. Well, now I have the evidence:

1. Goldmann’s admission: “But in 1945 there were close to six hundred thousand Jewish concentration camp survivors, [...]; this is [...] a historical fact.” and
2. David Kimche’s boastful statement that they “[...] succeeded in directing a stream of 300,000 Jews across Europe and in transporting well over 100,000 to Palestine in the face of such strenuous opposition.”)

This adds up to about 1 million Jews. But where did Goldmann’s 600,000 concentration camp survivors and Kimche’s stream of 300,000 Jewish escapees and the 157,000 returnees from the USSR go? I estimate that less than 5% returned to their war-torn European homelands. No, the vast majority of them disappeared from Europe; that is certain. And where did the rest of these 1,000,000 or so Jews go? To Palestine? No, there only 73,000 Jews immigrated from 1945 to 15.5.1948, as can be read in the resolution. To the New World, then, especially to the United States?

Dissolution cites a remark of the *World Almanac and Book of Facts*, according to which “An independent study places the percentage [of the Jewish population] at 3.69%, and possible number of Jews in the United States at 6,290,000.”²⁰ Not 5.20 million (1943), but 6.29 million Jews were living in the USA in 1957 - about 1,000,000 more Jews than expected. This cannot be a coincidence!

Jewish Survivors in the Soviet Union

During World War II, the Soviets deported an estimated 35 million people (military and civilian) of their own population to Siberia and the Urals, including the vast majority of Jews – over 80%, and I suspect even more. The secretary of the Soviet Jewish Anti-Fascist Committee, Shachne Epstein, stated as late as the fall of 1944(!) that the Soviets had deported 3.5 million Jews from the occupied territories;²¹ one million Eastern Jews were outside the German sphere of influence anyway. After the war, Western Jewish historians and other authors repeatedly reported about deportations to Siberia and the Urals. Historian Dr. Alexander Dallin (Stanford University) wrote in 1957 that the civilians left behind amounted to only about 65 million;²² accordingly, about 35 million people were deported by the Soviets.

Gerald Reitlinger reported to his book *The Final Solution* 1961:²³

“[...] it became the Russian policy to remove the working population so that the towns should not benefit the enemy.”

and

“In most captured towns less than half the population stayed.”

90% of the Jews lived in the cities. Historian Joshua Rothenberg (Brandeis University) mentioned in 1970 that the mass of the Jewish population evaded by fleeing from the conquering (German) armies.²⁴ Moreover, the

²⁰ *World Almanac and Book of Facts*, New York, N.Y., p. 270.

²² Alexander Dallin, *Deutsche Herrschaft in Rußland 1941-1945*, Droste, Düsseldorf 1958, p. 5: “For the approximately sixty million people in the occupied territory, the German invasion offered [...]”

S. 378. “Of the occupied territory, which covers about 1 million square kilometers that were inhabited by more than 65 million people, [...]”

As already described in Chapter 3 of this book, on June 21, 1941, there were 90 to 100 million people living in the Soviet territory which later became German-occupied during the war. So up to 40 million people were missing, which the Soviets had dragged along; I estimate that just under half of them were evacuated or recruited for the Red Army.

²³ Gerald Reitlinger, *The Final Solutions*, New York, 1961 p. 228.

²⁴ Dr. Joshua Rothenberg, “Jewish Religion in the Soviet Union”, in: Lionel Kochan (ed.), *The Jews in Soviet Russia since 1917*, London, 1970, p. 172.

Soviets deported first and foremost the Jews, as the most technically and academically educated part of the population. The Institute of Jewish Affairs wrote that in many cities and towns, most especially in Ukraine and Belarus, Jews were among the first to be evacuated, and that there was enough time to evacuate the civilian population.²⁵

The *Encyclopaedia Judaica* and the *American Jewish Year Book* reported that evacuations and deportations had occurred at least a week before the outbreak of war. The German counter-intelligence *Abwehr* had also reported since February 1940 that the Soviets were systematically deporting Polish, Ukrainian, and Jewish civilians from western Ukraine.²⁶

From cities such as Kharkov, Kherson, Dneprpetrovsk, Mariupol, Melitopol, Minsk, Nikolayev, Novograd-Volynsk, Poltava, Zhitomir, Smolensk, Taganrog, and Chernigov – certainly also Kalinin – virtually all Jews had been deported or had been evacuated (75-100%); and of the rest, of which we have news, such as Berdichev, Kiev, Kirovograd, Odessa, Uman, Vinitsa and Vitebsk, perhaps a little less. That much is already stated in *The Dissolution*.

Therefore, up to 40 million people have been recruited, exiled and deported by the Soviets, as is also confirmed by Edward C. Carter (Russian War Relief), who gave a figure of 37 million. And the U.S. Republican presidential candidate Wendell Willkie, on the occasion of a dinner in the Kremlin, spoke of 60 million Soviet citizens who had remained behind in the territories conquered by the Germans, which means that, of the original 100 million or so Soviet citizens in this area, about 40 million must have been deported or recruited (see p. 74). The deportees consisted mainly of recruitable men, specialists of all stripes, Eastern Jews and Russians (one quarter each of the urban population), and workers; leaving aside recruitable men, it was clear that the Russian and Eastern Jewish urban populations were particularly affected by the deportation measures, and that the White Russian and Ukrainian (rural) populations were significantly less affected.

When among others Jewish-Soviet (autumn 1944), Jewish-American and Jewish-English historians speak repeatedly about the immense extent of the Soviet deportation measures on the civilian population, especially on the Russians or Eastern Jews, then it is incomprehensible when this is still being denied or when this fact is quite simply passed over.

In *The Dissolution* I estimated, on the basis of innumerable pieces of evidence, the number of surviving Soviet Eastern Jews (1945) at 4.3 million, including the survivors of (at most) about 700,000 Soviet Eastern Jews who had fallen into German hands (see Table 29, under C.).²⁷ Since

²⁵ Institute of Jewish Affairs, *Hitler's Ten-Year War on the Jews*, New York, 1943, p. 186.

²⁶ See the present study, p. xzy, xzy.

²⁷ See the present study, p.. xzy.

then, tremendous upheavals have shaken the giant empire: the Soviet Union disintegrated.

The Zionist and Mr. Jackson's opinion-not even an estimate-that only two million Jews survived in the USSR in 1945,²⁸ prevailed, although the Soviets and Zionists, respectively, presented no evidence to support it (see Table 27, under C.). Who is right? So much for the resolution.

On behalf of the League of Nations, Professor Frank Lorimer (Princeton University) studied the natural fertility of the Soviet peoples in 1946 and concluded that the Jews had the lowest fertility in 1926; it was just high enough to maintain the population. The fertility for the years 1959 and 1989 calculated on the same basis yields (to maintain a population, 500 are necessary):

1926	509 ²⁹
1959	242 ³⁰
1989	215 ³⁰

The Jewish fertility rates of the two post-war generations are not even half of those of their parents' generation which in the medium term meant the self-destruction of the Eastern Jewish population in Eastern Europe.

This drastic decline in birth rates and assimilation in the local population had led to the failure of the population of Eastern European Jews in the Soviet Union to hold its own, losing almost half of the Jewish population between 1945 and 1989. The first Soviet census after World War 2 (1959) counted 2,268,000 self-identified Jews; the last was in 1989, with only 1,451,000 Jews.³⁰ The decrease of 817,000 reflects a birth deficit and death balance of 518,000 and emigration of 299,000 Jews.

However, something unexpected happened as a result of the breakup of the Soviet Union: Eastern Jews were able to emigrate *en masse* from the successor states to the Soviet Union. Thus, between 1989 and 2007, 1,630,000 Jews emigrated, mostly young people;³¹ the number of births had to tumble as a result. A birth deficit of (say) 300,000 was the result. Taken together, almost two million (9+174+116+1,630) Eastern Jewish emigrants left Soviet Russia or its successor states between 1959 and 2007. Their destination countries were mainly Israel and the USA, less Germany,

²⁸ *American Jewish Year Book*, New York, 1946, Vol. 48, pp. 603-607.

²⁹ Dr. Frank Lorimer, *The Population of the Soviet Union*, History and Prospects, Geneva (League of Nations), 1946, pp. 95f.

³⁰ On the same basis as Lorimer, only for Russia, Ukraine and Belarus, cf. Mark Tolts, "Demographic Trends of the Jews in the Three Slavic Republics of the Former USSR: A Comparative Analysis", in: S. DellaPergola and J. Even (eds.), *Papers in Jewish Demography 1993*, Jerusalem 1997, pp. 171-173.

³¹ The number of Jews who emigrated is overestimated because it includes a proportion of non-Jewish kin; conversely, Jews also assimilated into the general population.

Canada and elsewhere!³² This would have been more than the absolute “end” for the Jews in the successor states of the Soviet Union – if the Soviet data were correct.

But far from it! Despite the initial 82,000 larger initial number (1945) and the negative final number of 500,000 (2007), the number of Jews in the successor states of the Soviet Union (SSSU) was still calculated at a “self-identified” 357,000.³³ At the same time, Putin’s friend, Russia’s Chief Rabbi Berel Lazar,³⁴ claims the number of Jews in Russia is still 1 to 2 million (does he perhaps mean in the SSSU?), and the National Conference on Soviet Jewry (NCSJ),³⁵ a U.S.-based body for Russian-speaking Jews, speaks of 400,000 to 700,000 Jews in Russia, and one to one and a half million for the SSSU. The numbers cited by Lazar and NCSJ are probably exaggerated (at least I suspect so). There is no better evidence than Table 30 (left) that the 1959 Soviet census vastly underestimated the Jewish population.

If two million emigrated at the same time as dramatic birth deficits prevailed, then it is only logical that many more Jews must have survived in 1945; so, the Zionists’ claim is *false*!

However, the peculiarities of the Soviet censuses do not allow to reliably determine the numerical strength of the Jewish people in the Soviet Union at that time: A part of the Jews was no longer willing to put up with the hostility that an open confession to their nationality entailed, and had themselves registered under a different nationality. I see no reason why the demographic structure of the two groups – those who confessed to their nationality and those who pro forma declared a different nationality – should differ in any way.

Therefore, I applied the same demographic structure to the surviving deported (both the “assimilated” and the “self-identifying”) Soviet Eastern Jews of 4.3 million (1945) – according to *The Dissolution* – hence the same percentage birth deficits and absolute emigrations.

³² Mark Tolts, “Population and Migration: Migration since World War I.” *YIVO Encyclopedia of Jews in Eastern Europe* 12; October 2010, and 27 June 2011 www.yivoencyclopedia.org/article.aspx/Population_and_Migration/Migration_since_World_War_I. He writes that 1.6 million Jews emigrated from the Soviet Union/SSSU to the USA, Israel and Germany in the period 1989-2005; it is estimated that almost 100,000 Jews also emigrated there in 2006/07. And in addition several tens of thousands to other countries (e.g. Canada). This plus the 300,000 Jews from 1970-1988 brings the number of emigrated Jews from the Soviet Union to 2 million. One must take into account that the Jewish emigration figures are overestimated, because they include many non-Jewish spouses and children; on the other hand, the number of Jews assimilated into the Slavic population is probably much larger.

³³ *AJYB* 2007; pp. 583 and 592.

³⁴ Born in Italy in 1964; emigrated to New York at the age of 15, acquired U.S. citizenship. 1990 Rabbi in Moscow. 1999 Chief Rabbi of Russia.

³⁵ Anna Rudnitskaya, “Fishing for Jews in Russia’s muddy waters”, *NCSJ*; 23 February 2010 (Internet).

And lo and behold, after the emigration wave in the 1970s and 1980s, and especially in the 1990s, of two million Jews (as mentioned earlier) and the calculated birth deficits of over one and a half million (150+199+304+468+550) in the postwar period, there still remain 700,000 Jews in the successor states of the Soviet Union for 2007: 357,000 ‘self-identified’ and theoretically 343,000 assimilated’ Jews. I have no idea how many there really are (whether 50,000, 500,000 or 750,000) (see Table 30, right).

It makes no noticeable difference to assume a birth deficit of only 10% since 1989 – that would presuppose a baby boom, which would be very difficult to imagine in view of the sudden increase in emigration, since the younger, fertile strata of the population are most likely to leave their homeland – the birth deficit would still be 300,000; it would not change anything fundamental.

But the figures make it clear: the figure of two million Jews in the Soviet Union (in 1945) lacks any real basis; in other words, it is clearly a political figure. There must have been more than twice that number. It seems that *The Dissolution*’s estimate of 4.3 million Soviet Jews in 1945 is closest to the truth after all.

Russia still owes the world an explanation as to what happened to the over 35 million soldiers/recruits and civilians – over 3.5 million of them Jews – deported to the parts of the USSR not conquered by the Germans (unoccupied Russia, Siberia and the Urals) during World War II.

Summary

It is no longer doubtful that the Eastern Jewish population in what later became temporarily German- and then Soviet-occupied Europe dropped from over nine million in the 1930s to about eight million anno 1939 (Institute of Contemporary History, *Universal Jewish Encyclopedia*). How else to explain the hundreds of thousands of Jewish immigrants in North and South America, Western Europe, Palestine, etc. before the war (Assistant Secretary of State/Deputy U.S. Secretary of State Breckinridge Long, Dr. Markus Wischnitzer, *American Jewish Year Book*)?

In addition to the hundreds of thousands of Jewish dead, equally indisputable are – or should be – the number of those rediscovered, approximately one million concentration-camp prisoners and escapees in Poland, Czechoslovakia, Hungary, etc., i.e., those where were alleged “missing.” The world is still waiting for an answer from the Zionists, from which countries they came, from which concentration camps or ghettos they came, how many there were and – sure enough – where they went, because they are no longer in Europe (the head of UNRRA of Germany Sir Freder-

ick Morgan, the Israeli Mossad agent David Kimche, the long-time president of the World Jewish Congress Dr. Nahum Goldmann, the *American Jewish Year Book*, also the U.S. War Refugee Board, the Institute of Jewish Affairs, and HICEM-Jewish Colonization Association). Instead, we hear only embarrassed silence!

In any case, the number of Eastern Jewish survivors in the Soviet Union estimated by the Zionists (2,032,000) must be revised upward by a few million. The Soviet evacuation of people and material in the pre-war period and during the war, attested to by innumerable Zionist and German testimonies, can no longer be denied (Dallin, Epstein, Reitlinger, Rothenberg, among others).³⁶ A small part of the Soviet Jews did not comply with the evacuation order (due to old age, illness, infirmity, etc.); at most about 700,000 came under German administration. (I suspect that the figure of 700,000 is rather too large, because German figures – if they existed – suggest a much smaller number of Eastern Jews who stayed behind; but these are mere guesses). These (at most) 700,000 Soviet Eastern Jews plus the nearly 2,800,000 non-Soviet Jews within the German sphere of influence add up to about 3.5 million Jews, not 6 million or even 9 million; more Jews did not fall into German hands, rather fewer (see Table 31 under D.).

Unfortunately, I have not been able to come up with new figures for the Polish, Belorussian, Ukrainian, Russian, Baltic and Romanian Jews deported by the Soviets. But postponed is not canceled!

Instead, however, there is a probability bordering on certainty that in 1945 there were more than 4 million – mostly deported – Eastern Jews living in the Soviet Union who had survived under Stalin's brutal and murderous rule (see Table 30, right); most of the non-surviving Eastern Jews perished by the hundreds of thousands as Red Army soldiers or in Soviet concentration camps or in factories in the Urals as a result of inhumane working conditions, as described in *The Dissolution* (see Table 31 under E.).

The Eastern Jewish losses at the front, in the Urals and in Siberia (military and civilian) must have been quite simply enormous – estimated by

³⁶ The book *Dimension des Völkermords* (Oldenbourg, Munich 1991) by Wolfgang Benz (ed.), so highly praised in the press, does not mention the fact that

- there were one million *fewer* Jews in Europe at the outbreak of war than what Universal and his colleague Graml of the Institute of Contemporary History found out;
- about one million Jews (concentration camp prisoners and escapees) were rediscovered, as the *American Jewish Year Book* and Dr. Nahum Goldmann as well as David Kimche affirmed (these Jews were part of the post-war emigration = exodus!);
- the Soviets deported (in some cases even before the outbreak of war) up to a third of their own population, including the 3.5 million Jews. This is confirmed, for instance, by Republican presidential candidate Wendell L. Willkie; Berlin-born Jewish historian Alexander Dallin; Edward C. Carter, president of the Communist-infiltrated Russian War Relief and holder of the Soviet Order of the Red Banner of Labor; and Shachne Epstein, secretary of the Soviet Jewish Anti-Fascist Committee.

me on the basis of Zionist, Soviet, American and German data very roughly at one million; probably more. The Soviets fought with all means for survival, and did not care about millions of human lives!

In the end, all indications point to a devastating, natural Eastern Jewish population decline since 1945 in the Soviet Union³⁷ – caused by far too low birth rates and assimilation, and not least by the wave of Eastern Jewish emigration from the Soviet Union and from the successor states of the Soviet Union – bringing about a sad finale for Eastern Jews in this part of the world.

A tripling of the actual Jewish dead, which are blamed on the German adversary, I regard as completely “normal” in view of their own million-fold murder of innocent German children, women, old men and women by Allied area bombardment and Soviet cruelty, to name only two of the unimagined Soviet-Allied war crimes – but does it have to be a thirtyfold increase of the actual Jewish dead in the German camps?

³⁷ About 30% between 1945 and the last Soviet census in 1989.

Scorched Earth: The Soviet Deployment

On the Soviet deployment, Viktor Suvorov (pen name of Vladimir Bagdanovich Resun) took a stand: he worked in the General Staff of the Armed Forces of the USSR. As a high-ranking officer of the Soviet military intelligence GRU, he served as a Soviet diplomat in Western Europe. In 1978, he requested political asylum in Britain. He called Hitler a rabid dog, cannibal and criminal. (I add this only to show whose brainchild he is).

Nevertheless, he is the author of the article “Who was Planning to Attack Whom in June 1941, Hitler or Stalin?”³⁸ and the book *The Icebreaker. The History of the so-called “Great Patriotic War”. Brief Instructions*.³⁹

Excerpts from “Who was Planning to Attack Whom in June 1941, Hitler or Stalin?” (With my emphases)

p. 52: “*There were in fact 170 divisions in the 1st Strategic Echelon. Of these 56 were already deployed directly on the frontier,^[40] 114 were deployed further back in the frontier zone, but: ‘On 12-15 June the order was given to the western military districts: all divisions stationed in the interior [of those military districts] are to be moved nearer to the state frontier’.*^[41] *The entire 1st Strategic Echelon now began its concentration directly in the border belt. To these 114 must be added the 69 divisions of 2nd Strategic Echelon which had either moved already or were preparing to do so. Thus, on the day of the famous TASS communique, the movement of 183 divisions was in train; the biggest troop movement by a single state in the history of civilisation; a movement right to the frontier itself and conducted with maximum secrecy and concealment.”*

p. 53: “*Troops preparing for defence bury themselves in the ground, dig trenches and anti-tank ditches, construct cover and barbed wire barricades. In the first instance this is done in the most likely avenues of enemy advance, across roads and behind river lines. But the Red Army did nothing of the kind. As has been recorded earlier, divisions were hidden in woods near the frontier in exactly the same way as were the German divisions before they made their surprise attack. ‘The rifle*

troops could have occupied and completed defensive installations, but this was not done'. [42...]

This failure to erect defensive works is all the more curious since, with the signing of the Soviet-German Non-Aggression Treaty and the subsequent 'partition' of Poland between the two states, Soviet and German forces now confronted each other across a common frontier with no 'buffer state' between them. Moreover, while common prudence might have dictated the strengthening or at least the retention of the Stalin Line fortification along the old frontier, the opposite was happening. This powerful protective system was dismantled and, in many places blown up or earthed over; minefields were disarmed and over a distance of thousands of kilometres 'the barbed wire had been removed'. [43] Partisan detachments which had been created in case these lands were occupied by the enemy, were disbanded, [44] explosive charges were removed from thousands of bridges, railway stations and industrial complexes which had been prepared for destruction in case of invasion. In short, colossal efforts were made to destroy everything connected with defence. [45] At the same time, while prior to the treaty's signature only divisions and corps had existed in the Soviet frontier districts, formed armies now began to assemble in the newly-extended border zone. Between August 1939 and April 1941, the number of armies on the Soviet Western border increased from zero to 11. Three more joined them during May together with five airborne corps. If Hitler had not attacked first, Stalin would have had 23 armies and more than 20 independent corps, facing him. This took place before general mobilisation."

pp. 53f.: "The 1st Strategic Echelon which was forming up on the Soviet border in June 1941 was, by virtue of its organisational structure, deployment and military preparedness, clearly offensive in nature. So too was the 2nd Strategic Echelon which began its secret movement towards the German frontier on 13 June 1941. Many Soviet marshals and generals do not acknowledge these facts directly and, of course, both echelons were overwhelmed in the German surprise attack and had perforce to fight defensively. [...]"

It seems certain that the Soviet concentration on the frontier was due to be completed by 10 July.^[46] Thus, the German blow which fell just 19 days earlier found the Red Army in a most unfavourable situation – in railway wagons [...and] stuck helpless in open fields. [...]

The more closely one studies Stalin 's actions during this critical period the more apparent it becomes that they were not a reaction to Hitler's moves.^[47] Stalin acted according to his own plans, and these foresaw a full concentration of Soviet troops on the frontier by 10 July.

Certain conclusions are incontrovertible. First, the mobilised divisions could not have returned to the distant districts from whence they came. Such a move again would have absorbed the entire resources of the rail network for many months and would have resulted in economic catastrophe. Secondly, these gigantic forces could not have been left to spend the winter where they were hidden. So many new divisions had been created and assembled in the frontal belt that many of them had already had to spend the winter of 1940-41 in dugouts.^[48] As early as 1940 there had been insufficient training centres and artillery and rifle ranges in the newly-acquired western frontier zone even for the existing divisions.^[49] Troops who cannot train rapidly lose the capacity to fight. [...]

In every major human complex endeavour there exist a critical moment at which events reach a point of no return. This moment for the Soviet Union fell 13 June 1941. After that day, masses of Soviet troops were secretly but inexorably moving towards the German border. Once 13 June had passed the Soviet leadership could no longer turn these troops back nor even halt them, for economic and military reasons. War became inevitable for the Soviet Union, irrespective of how Hitler might have acted. Finally, the composition and disposition of the forces in the frontier zone did not indicate that they were intended to remain there. Such features as the airborne corps in the first crust of the 'defences,' artillery units in the forward locations, the dismantling of the Stalin Line and the absence of any defence in depth or effort to construct one, do not point to the intention of maintaining any permanent defensive position along the border. If all this is viewed in the context of the Zhukov doctrinal framework outlined earlier, then it becomes clear that the

only credible military intention which Stalin could have had was to begin the war himself in the summer of 1941.”

Excerpts from *The Icebreaker. The History of the so-called “Great Patriotic War”* (translated from the German edition; with my emphases)

p. 40: “1927 is the year of the beginning industrialization of the USSR. [...] At the beginning of the first Five-Year Plan, the Red Army possessed 92 tanks; at its end [1932], over 4000. [...]

In the first two five-year plans [1927-1937], 24,708 combat aircraft were produced.”

p. 41: “The result of collectivization and subsequent starvation was 10 to 16 million people murdered, perished in the camps, starved to death; information about an even higher number has recently passed Soviet censors. (‘Questions of History’ 1988, No. 6, p. 32)”

p. 103: “Hitler knew that war with Russia could not be avoided. Why didn’t he commission weapons and combat equipment that could also be used in Russia? If German industry produced only weapons that only could be used in Western Europe and Africa, but not in Russia, how can it be assumed that Germany was prepared for this war?”

p. 117: “As a result of the Molotov-Ribbentrop Pact, the Soviet frontier had been advanced westward, consequently the line from which ‘liberation’ was to be effected had also advanced westward, and the Stalin Line was of no further use to anyone in a war of aggression. It could have been used in defensive warfare, though.”

p. 129: “For wars of aggression Hitler prepared, and in 1936 he created the airborne troops. The number of paratroopers in this force at the beginning of World War II was 4,000 men. [...] Stalin [...] created the Airborne Force in 1930. At the beginning of World War II, the Soviet Union had over one million trained paratroopers.”

p. 130: “In defensive warfare, paratroopers are NOT needed.”

pp. 150-153: “In July 1940 Hitler voices the thought that the Soviet Union could become very dangerous, especially if German troops crossed from the European mainland to the British Isles and into Africa. On November 12 [1940], in a conversation with Molotov, Hitler refers to the need to maintain a large contingent of German troops in Romania – a clear allusion to the Soviet military threat to Romanian oil. [...]

Hitler had urged the Soviet head of government to avert the Soviet threat from the source of German oil. Stalin and Molotov did not do so. So, who is to blame for the outbreak of the war? Who threatened whom? Who provoked whom to countermeasures? [...]

In order to defend Romania in the event of a Soviet offensive, a German strike must be made elsewhere, thereby diverting the attention of the Red Army from the oil fields. [...] it [was] agreed that a diversionary attack [could] succeed only if it was a powerful and at the same time surprising operation. The [German] troop contingent for this operation was gradually increased until finally [...] practically all [German] land forces and a large part of the air force were involved in this operation. [...]

Hitler's calculation worked out: The German attack [in June] 1941 at another point forced the Soviet troops to retreat along the entire front. [...]

Hitler's blow had been tremendous, but not fatal. [...]

There have been few errors in Stalin's career. One of these few – though the most decisive – was the occupation of Bessarabia in 1940 [...].

The annexation of Bessarabia by the Soviet Union [June 1940] and the concentration of a strong offensive potential in this area, including an airborne corps and the Danube flotilla, made Hitler see the strategic situation in a completely new light and prompted him to take appropriate precautions.”

p. 162: *“In 1939, the Soviet Union began to deploy armies in the European part of its country.”*

p. 168: *“German troops have hardly remained on the Soviet borders [only 6 divisions!]. And at this very moment Stalin begins the camouflaged deployment of a large number of armies. [...] The farther the German divisions move away to the west, north, south, the more Soviet armies are deployed against Germany.”* (16 Soviet shock armies, each of which has more than 2000 tanks; the 4 German armored forces have 600-1000 tanks each).

p. 176: *“[...] the 9th [Soviet] Army [of the 3 extremely strong shock armies, the strongest army of the First Strategic Echelon, had] 20 divisions [...], including 6 armored divisions [...and] 3,341 tanks. [...] Quantitatively, this corresponds to what the entire Wehrmacht possesses, and qualitatively, quite a bit better.”*

p. 177: *“In the first half of June 1941, the most powerful army in the world is deployed in the Soviet Union, but not on the German border [...but] on the Romanian border [Bessarabia...].”*

p. 178: *“For what? For defense? I beg you, there are only small forces on the Romanian side, [...]. An advance [of the 9th Army] into Romania would mean collapse for Germany, would result in the standstill of*

all tanks and aircraft, all machinery, ships, all industry and transportation. Oil is the lifeblood of war, and the heart of Germany beat [...] in Romania. An attack on Romania was an immediate attack on the heartbeat of Germany."

Maps: *"The 19th [Soviet] Army – strongest of the Second Strategic Echelon – was [...] brought up to the Romanian border. Beginning of the camouflaged buildup of the Second Strategic Echelon to the western border is June 13, 1941."* (It had 30 divisions.)

The 9th Army – the strongest army of the First Strategic Echelon – and the 19th Army of the Second Strategic Echelon had the task of immediately occupying the Romanian oil fields in the Ploiești area in order to get their hands on Germany's unprotected primary source of oil.

p. 314: *"Marshal of the Soviet Union A.A. Grechko can testify to it: 'Eleven days after Hitler accepted the final war plan against the Soviet Union (December 18, 1940), this fact and the essential dates of this decision of the German leadership were known to our reconnaissance organs.'" (Military History Review, 1966, No. 6, p. 8.)*

p. 315: *"On June 21, 1941, a meeting of the Politburo was held. [The head of military intelligence, Lieutenant General F.I.] Golikov reported [...] that immediate preparations for the invasion [of the Soviet Union] had not yet begun, but without these preparations the war could not be started. [...]*

Ten to twelve hours later, 'Unternehmen Barbarossa' began."

pp. 337f.: *"The problem [of the Soviet soldiers before the outbreak of war] is that on the western borders [...] there are no firing ranges, no military training areas, no tank courses, no training centers, that the conditions for combat training are lacking. [...]*

The war didn't start the way Stalin wanted it to, and that's why it didn't end the way he wanted either: Stalin got only half of Europe."

p. 406: *"Field Marshal W. Keitel: 'I emphasize that all preparatory measures carried out by us up to the spring of 1941 bore the character of pure defensive precautions in the event of an attack by the Red Army. In this respect, the whole war in the East can be called a preventive war, so to speak. [...] We decided [...] to preempt an attack by Soviet Russia and to crush its forces by a surprise attack. Towards the spring of 1941 I came to the firm conviction that the strong concentration of Russian troops and their subsequent attack on Germany could put us in an extraordinarily critical situation from a strategic and economic point of view. [...] In the first weeks, an attack on the part of Russia*

would have placed Germany in an extremely unfavorable situation. Our attack was a direct consequence of this threat. [...]’ [...]

Colonel General A. Jodl, the chief designer of the German war plans, claimed the same. [...] Keitel and Jodl did not change their point of view, and were hanged along with the other ‘main war criminals’ due to the verdict of the so-called ‘International Tribunal’ in Nuremberg. One of the main charges against them was ‘unleashing an unprovoked war of aggression’ against the Soviet Union.”

p. 420: “So the Soviet staffs had NOT worked out any plans for a defense before the war, and also none for plans for counteroffensive? ... O no, they were known to have worked intensively. They worked out plans for the [offensive] war.”

p. 424: “On June 26, 1941, the 4th Air Corps began bombing the oil fields of Ploiești, Romania. In those few days of bombing, oil production in Romania had dropped by almost half. Even in a situation where virtually the entire Soviet air force was held down at its airfields, it still found enough power to inflict considerable damage on oil production. In any other situation, the Soviet air forces would have been much more dangerous and could have crippled the entire German military, industrial, and transportation capacity with their operations against the petroleum areas. Hitler had understood only too well this threat and had considered an invasion of the USSR the only possible defense. But even this did not save him.”

pp. 429f.: “Hitler considered the Soviet invasion inevitable, but he had not expected it in the very near future. German troops were used for operations in secondary theaters [suppression of the Communist uprising against the pro-German Serbian regime; occupation of Norway to forestall a British occupation of Norway (because of the iron ore mine at Kiruna, Sweden), etc.], and the start of ‘Operation Barbarossa’ was postponed. It finally got underway on 22 June 1941. Hitler was obviously not aware of how much luck had been with him. If ‘Operation Barbarossa’ had been postponed again [...] Hitler would not have had to lay hands on himself only in 1945, but much earlier. [...]

There are several indications that the date for the Soviet operation ‘Tunderstorm’ was set for July 6, 1941. The memoirs of Soviet marshals, generals and admirals, archival documents, a mathematical analysis of the available data on the movement of thousands of Soviet military transport trains – all this points to July 10, 1941 as the date when the deployment of the Red Army’s Second Strategic Echelon near the western borders was to be completed. But Soviet military theory en-

visaged the transition to the brisk attack not after the completed concentration of troops, but before this completion. In this case, a part of the Second Strategic Echelon could be unloaded and led into battle already on enemy territory. [...]

Zhukov (and Stalin as well) had a penchant for conducting their surprise strikes on a Sunday morning. July 6, 1941 was the last Sunday before the full deployment of Soviet troops. [...]

Army General S.P. Ivanov gives [...] a direct reference to this date. The German troops had succeeded in 'literally beating us by two weeks.' – Had this not happened, history would have taken a different course. The Red Army would have reached the objective of Berlin very soon, and also other objectives further west in Europe [France?]."

*pp. 249f.: "The full deployment of Soviet troops on the German border was planned for July 10." (Army General S.P. Ivanov, *The Initial Phase of the War*, p. 211.)*

Air-Photo Evidence

World-War-Two Photos of Alleged
Mass-Murder Sites Analyzed

Edited by Germar Rudolf

Academic Research Media Review Education Group Ltd
January 2024

HOLOCAUST HANDBOOKS, Volume 27:

Germar Rudolf (ed.): *Air-Photo Evidence:*

World-War-Two Photos of Alleged Mass-Murder Sites Analyzed.

The first three editions of this book bore John C. Ball as the author of this work. On Jan. 29, 2015, John requested not to use his name for new editions, but allowed us the use all of the photographic and textual material as we see fit.

The first edition appeared in 1992 under the title *Air Photo Evidence: Auschwitz, Treblinka, Majdanek, Sobibor, Bergen-Belsen, Belzec, Babi Yar, Katyn Forest— World War II photos of alleged mass murder camps! Does evidence confirm or dismiss eye witness stories? Were gas chamber marks put on by CIA workers?*, self-published by the author, Ball Resource Services Ltd., Delta, BC, Canada.

The second edition of January 2015 has the same title as the current one and is a marginally corrected reprint of the first edition with a preface similar to the present one plus a number of footnotes added.

Compared to the fifth edition of January 2018, this one has updated bibliographic information plus a changed chapter on Babi Yar.

Foreword

In his 1976 book *The Hoax of the Twentieth Century*, Dr. Arthur R. Butz explained in detail that, during the Second World War, the German industrial activities around the infamous Auschwitz Concentration Camp were of great strategic importance to the Allies. Hence he concluded that Allied reconnaissance aircraft must have taken many photos of the area, which to this day could be very revealing regarding the true nature of the Auschwitz Camp, as certain activities claimed by many eyewitnesses would have been so vast that they could not have been missed by Allied intelligence.¹ But no such photos had been released by 1976. That changed three years later, when the U.S. Central Intelligence Agency published a slender brochure containing a few such aerial photos. The authors (Brugioni/Poirier) claimed that these photos do indeed prove the claims made by many witnesses in terms of containing evidence for an ongoing mass murder. At that time, revisionism was not yet well organized in the Anglo-Saxon world, so no thorough refutation of the CIA's claims was published at that time in English. I know only of reactions by German revisionists who undertook to debunk the CIA's claims (see Stäglich & Walendy.)

The matter changed in 1992 when John Clive Ball published the first edition of the present book. This book was a game changer. Rather than reacting to what others had claimed, it set a new standard of historical forensics by which all future publications about the Holocaust had to be tested.

Almost every revisionist book that appeared after Ball's epoch-making study also included analysis of relevant air photos. The most important book in this regard is probably Mattogno's *Auschwitz: Open-Air Incinerations*. It investigates the claims made by many Auschwitz witnesses that, from May through August 1944, gargantuan cremation pyres in huge pits were burning day and night at the Auschwitz-Birkenau Camp, upon which the corpses of hundreds of thousands of murdered Hungarian Jews were being turned into ashes. It is claimed that during this time the entire area was blanketed in thick smoke. Of course pictorial evidence of such large undertakings would have been captured on air photos taken by Allied reconnaissance planes. But as the reader of the present study will discover, the extensive photos of the place and time show nothing unusual at all.

It goes without saying that some of the few orthodox historians who dared to confront revisionist research had to deal with these air photos as well (foremost Shermer/Grobman and Zimmerman), although their attempts at papering over the huge cracks in orthodox historiography were swiftly exposed as seriously flawed by leading revisionists.²

A few more air photos of the Auschwitz Camp taken by the Allied and German air forces have been discovered since the first edition of the present study had appeared, but they show much the same thing. A few of them require our attention, though, as they show a column of smoke rising from a small area of the Birkenau Camp. I have added them and a brief discussion of what we see there to Chapter 5.9. Also, the subject of massive open-air incinerations allegedly going on between mid-May and late summer 1944 in an area west of the Birkenau Camp near the so-called "Bunker 2" – a makeshift homicidal gas chamber of legendary proportions – has been dealt with in this new issue with the new Chapter 5.10. It also features two new air photos. None of them show any smoke in this area, though, hence no trace of any incinerations at all...

¹ In the 4th U.S. edition of 2015, see the chapter "Auschwitz of Great Interest to Americans," pp. 85-89, and "Where are the pictures?," pp. 202f.

² See Carlo Mattogno, "Denying Evidence," in: Rudolf/, pp. 203-280, in particular pp. 236-244; and "The Elusive Holes of Death," *ibid.*, pp. 291-407; especially pp. 303-305, 380-384.

In 1994, a paper by John Ball was published which summarized the present book and added a few more aspects, which the interested reader might want to consult as well.³ One particularly interesting issue is Ball's suspicion that the air photos released in 1979 by the CIA have been tampered with, as he describes in the present book (Chapter 5.4). In his 1994 paper he wrote about this:⁴

"After realizing these facts of the matter, I went to the National Archives and requested to see the originals, since the photos given to me as originals had clearly been altered. And in fact I was then given air photos which I was assured were the originals. These were indeed of better quality than the negatives I had been given first: due to the better focus, the work of the forgers was considerably more clearly apparent at the same places on the photos. When I pointed this out to the Archives staff, I was told that these were the negatives which the National Archives had received from the CIA in 1979, and that they had always believed that they were in the precise state in which they had been taken from the reconnaissance planes in 1944. I was told that I was the first member of the public ever to have seen these negatives. Now they would be returned to the archives forever, to be handed out only at the request of government agencies such as the CIA."

A year later, an Austrian publication attacked Ball for these statements, insinuating that these negatives are available to anyone on request:⁵

"He [Ball] surrounds this claim [re. the alterations] with a graphic account of his research in the National Archives in Washington, where these photos, he claims, are now locked away for all time because he had proved that they were falsified. He withholds from his readers the fact that these same photos may be viewed in the State Museum of Auschwitz [...]"

It is needless to say that there can be only *one* original negative of each photograph, namely the one that was in the camera when the photo was taken (and which the CIA might have destroyed). All the other negatives are copies, of which in this case many may exist at various locations, each of them of course subject to loss of quality and alteration.

An interesting episode about the question whether or not these air photos have been tampered with occurred in the context of the second Zündel trial.⁶ During that time, Dino Brugioni approached Ernst Zündel privately and told him "off the record" that he himself does not believe that the air photos published by him prove the orthodox Holocaust narrative and that he, too, has the suspicion that the photos he was given by his superiors to analyze in 1979 had been tampered with.⁷ For me, of course, this is not much more than hearsay, so not much weight can be put onto it.

Fact is, however, that in 1999 Brugioni published a book entitled *Photo Fakery* which explored "The History and Techniques of Photographic Deception and Manipulation," according to the subtitle of the book. The book exposes and explains a wide variety of tampered-with photos of political importance. Only one set of photos in the entire book is claimed to be original, untampered and authentic: the Auschwitz air photos Brugioni had published 20 years earlier. Why would Brugioni include those *exceptions* in a book about forgeries which otherwise doesn't even remotely touch upon the Holocaust topic?⁸

I leave that to the reader's imagination.

³ John C. Ball, "Luftbildbeweise," in: Rudolf, *Der Holocaust auf dem Seziertisch*, pp. 275-290; English: "Air Photo Evidence," in: Rudolf, *Dissecting the Holocaust*, S. 263-277.

⁴ Here quoted from the English ed., *ibid.*, pp. 278f.

⁵ Bailer-Galanda/Benz/Neugebauer, p. 25 (translation mine).

⁶ On that trial see Kulaszka.

⁷ Ernst Zündel, private communication.

⁸ See the review by Widmann.

John Ball and I started working on a new edition of his book in late 2003/early 2004, when he started sending me new aerial photos not discussed in the first edition of the present study. At that time we also considered enabling the reader to look at some of the Auschwitz air photos taken in rapid succession with 3D glasses in order to get a three-dimensional impression. The project was delayed, as I was working on other projects, and then, in October 2005, I was actually arrested by the U.S. authorities and deported back to Germany, allegedly for an immigration violation, but really because my revisionist work had made me many powerful enemies (see Rudolf, *Resistance Is Obligatory*). At that time three other leading revisionists were also thrown in jail (Ernst Zündel, Siegfried Verbeke, David Irving). Although that is an entirely different story, fact is that John Ball got scared by this sudden spike in persecution of peaceful dissidents. Around that time, he decided to quit revisionism, hand over all material to others who wanted to continue, move to a different place, start a different business, and change his name. Only in early 2015, after I had published the greatly improved 3rd edition of the present book, did John Ball contact me. Since most of the material in this book is in the public domain for which John could not claim any copyright, and because he still did not want to get re-involved in, or associated with, revisionism, he asked me to remove his name from this new edition and use someone else's. He also told me that he could not help me with getting the original photo prints used to prepare his first edition, because in 1994 he had given them all to Ernst Zündel on his request, but when Zündel's home in Toronto was fire-bombed a year later, all the prints went up in flames. Therefore, for this edition, too, we will have to make do with the professionally prepared high-resolution scans of the images reproduced in the first edition. Quality losses are minimal, and the results visible in the present print-on-demand book are good enough for most of us. Those who want to seriously explore this issue in more depth are advised to get prints from the archival resources mentioned, though.

The present study has 168 pages, 48 more than the first edition. This is due not only to the fact that I have included a few more air photos addressing issues not discussed in earlier editions of this work – as mentioned before – but also because all the pertinent material which John Ball had published in his 1993 16-page brochure *The Ball Report* has been integrated. That brochure consisted mainly of Ball's schematic drawings of the crime scenes investigated plus a brief summary of chemical analyses of wall samples he had taken at Auschwitz in early 1993. I have expanded that subject with a brief introduction into the relevance of analyzing such samples, and by summarizing the analytic results obtained by other authors who preceded Ball with their sampling.

Several sections of Ball's original work have been extensively edited for this current edition, as they were erroneous to the point where keeping them as they were would have been irresponsible. Writing this, I do not mean to criticize Ball for the mistakes he made back then. In the early 1990s, John Ball was a novice in Holocaust research (as was I at the time). It was therefore to some degree inevitable for him to make a number of mistakes. Some of them he might have avoided, had he communicated with more-experienced researchers in the field prior to publishing the first edition of his book. Other errors, however, became apparent only due to subsequent research published in later years, upon which I could rely for this edition.

One of these issues – whether the black lines around the Birkenau crematoria are due to thick fences or the result of CIA manipulations – is addressed in this edition by Carlo Mattogno. He shows that the Auschwitz camp authorities planned to surround the crematoria with vegetation making them less conspicuous to the inmates, and a post-war photo indicates that at war's end a makeshift fence of tree branches was indeed present around at least one of the crematoria, or rather its ruins. I doubt, though, that such

a slender fence of twigs and branches could produce the thick dark lines on the air photos, which look more like massive, thick walls. For this reason, I keep Ball's original suspicion of manipulations as it is.

There have been two noteworthy reactions by experts to Ball's findings, one by Nevin Bryant, supervisor of Cartographic Applications and Image Processing Applications at NASA's Jet Propulsion Laboratory in Pasadena, California, the other by Carroll Lucas, an expert of air-photo interpretation with 45 years of experience working for the biggest criminal organization in the world, the CIA.

We know of Bryant's expert opinion only through what other wrote about it,⁹ which was pretty much limited to identifying several groups of inmates visible on the photos. Of course, in a camp housing many thousands of inmates, and during late spring and early summer 1944 at times perhaps even more than a hundred thousand, you would expect to see many groups of inmates moving about outdoors. That proves nothing. In that context, Shermer and Grobman committed a minor blunder about the so-called "moiré effect" which I address here on p. 63. (I am sure that Bryant would not have endorsed such nonsense.) Interestingly, Shermer and Grobman – and with them probably also Bryant – are completely silent about any outdoor cremations, even though that ought to be the primary focus of any air-photo analysis, as such cremations would be highly visible and would allow gauging the order of magnitude of the claimed events unfolding at Birkenau in 1944.

Lucas's 23-page report was published in its entirety (Zimmerman, pp. 276-298), but surprisingly he does not reproduce any air photo, and thus offers nothing at all to back up his claims and conclusions. Regarding outdoor cremations, he correctly points out that small smoke plumes are visible on some photos (Zimmerman, p. 290; see several such photos on pp. 97-101 in this study), but he neglects to compare those small fires with the kind of pyres that would have been needed if the claimed daily outdoor cremation of thousands of gassing victims had really happened. As Mattogno has shown,¹⁰ Lucas was apparently harassed by Zimmerman to make statements which are not supported by the evidence, like the claim that storage barracks are visible near the so-called Bunker 2 on a photograph of May 31, 1944, when later images clearly show that these storage barracks were built only subsequently (Zimmerman, p. 299; see p. 119 in this study). That leads me to believe that Lucas's analysis was not an expert report but rather a report of complaisance. At any rate, he, too, failed to find evidence for mass murder.

With this, please enjoy reading this fine pioneer work of Holocaust revisionism in its latest, revised edition.

At this point, I wish to express my gratitude to Jett Rucker for carefully proofing this study, to John Ball for sending me scans of his original hand-drawn maps and schematic drawings, to Hannes Metzner for his constructive criticism,¹¹ and last but not least to Carlo Mattogno for his critical and constructive peer review, in particular for his input regarding potential mass graves near the Auschwitz-Birkenau Camp as discussed in Section 5.13, as well as for writing his short essay on the crematoria fences added to this study on pp. 70-74.

About the First Edition's Author and this Book

April, 1992: Myself at the National Archives Air Photo Library in Alexandria, Virginia.

A brief history:

Residence: Residence: I have lived in British Columbia, Canada, almost all my life and now live in Delta, just outside of Vancouver.

Training: In 1981, I received a Bachelor of Science degree in Geology from the University of British Columbia.

Air photo experience: With my work as a mineral exploration geologist, I have interpreted air photos using stereo magnifying equipment since 1976.

Air photos:

- (1) I selected the 1939 to 1945 air photos of Europe and western Russia during April and May 1992 from the collection at the U.S. National Archives Air Photo Library in Alexandria, Virginia.
- (2) The photos were interpreted in Vancouver using a Jena Interpreterscope and a table stereo viewing magnifier, and
- (3) I then enlarged selected photos using a Pro-Lab 4 x 5 inch enlarger, and had them scanned for publication at 150 lines per inch.

Acknowledgement:

I wish to thank the staff at the National Archives Air Photo Library for their patient assistance in helping me locate the photographs reproduced in this book.

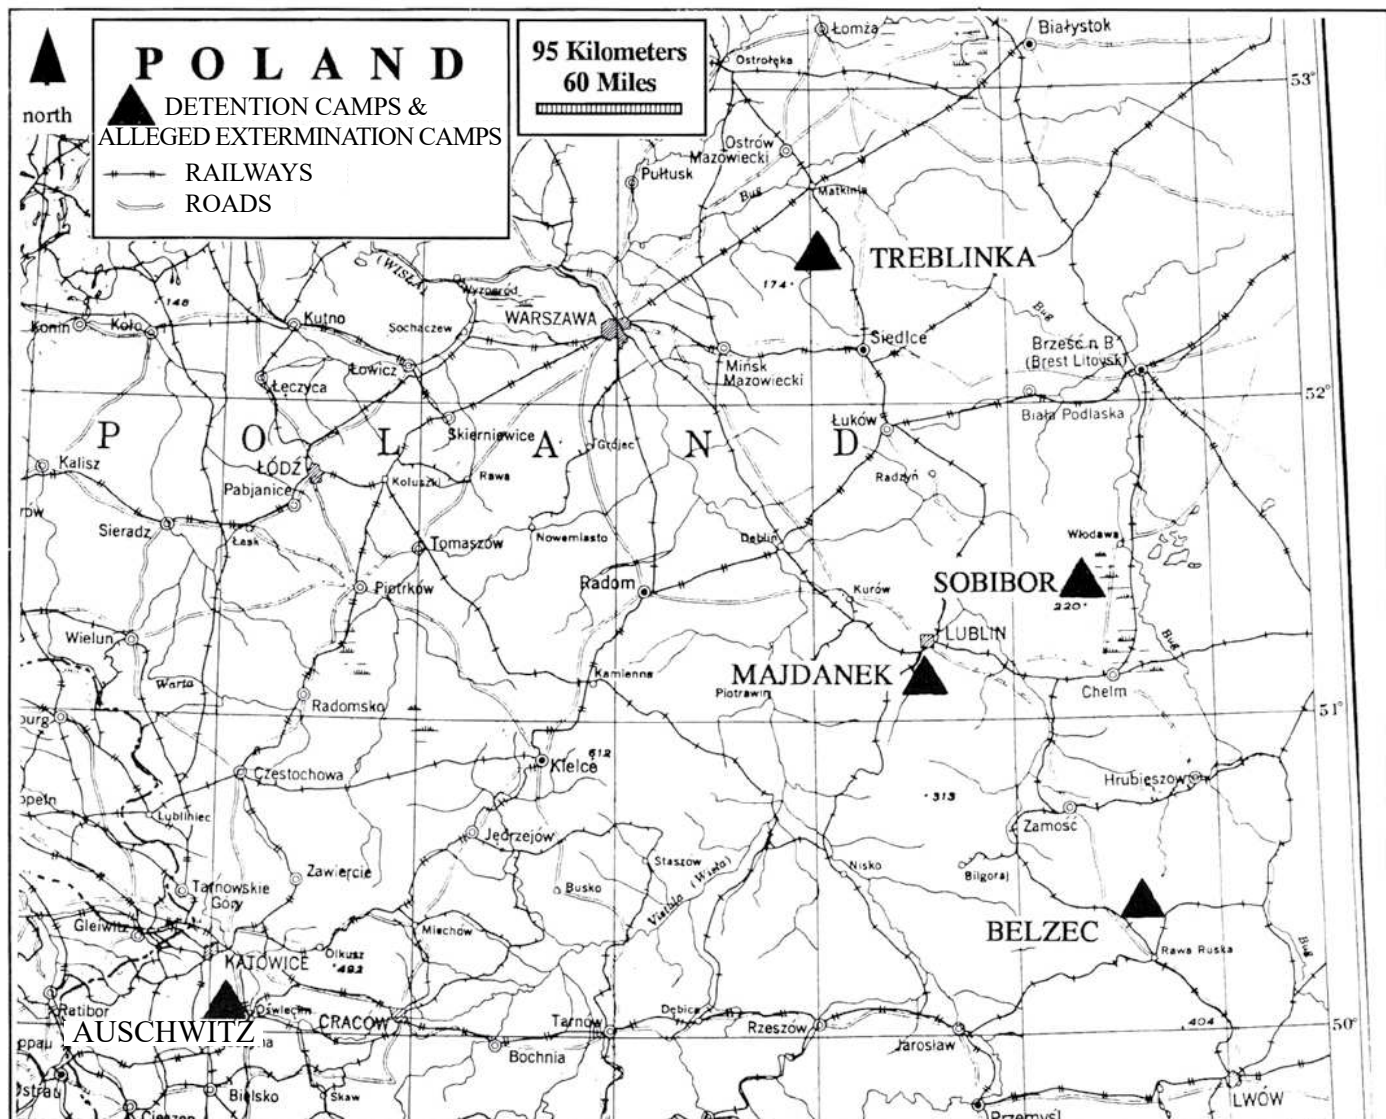

Irony of using *German* air photos:

It is ironic that half of the air photos in this book, which are being used to determine the truth about accusations that Germans systematically murdered people in detention camps, are those which were exposed by the *German* military from 1939 to 1945 when they were taking photos of targets such as railway lines and access roads.

Air photos taken from 1939 to 1945 by the Americans and British are only available for Auschwitz and Bergen-Belsen; all of the other 1939 to 1945 photos in this book were exposed by Zeiss Jena cameras in German air force planes.

Caveat

In 1998 John C. Ball started a website called www.air-photo.com. Due to the present book and this website, increasing social and legal pressure was exerted against Ball, who saw his livelihood as a mineral exploration geologist threatened. He therefore decided eventually to move from his old home to a new place, and to change his name. A revisionist friend maintained the website for a number of years, but it is now defunct.

Introduction

1. Objective when I started research:

My objective was to analyze aerial photographs of World War II German controlled detention camps in Poland for evidence to confirm the claims that mass murders, burials, and cremations had been conducted there, and to compare this evidence with information from other locations where mass executions or deaths together with mass burials had occurred.

2. Method:

I reviewed the books listed in the references and then compared these allegations for each of the alleged mass murder camps with the evidence revealed from studying the air photos. Enlargements were made of important pictures.

3. Chapter arrangement:

Chapters 2 to 4 review areas like the Katyn Forest where mass burials occurred,

Chapter 5 reveals air photo evidence about whether mass murders and cremations were being conducted at Auschwitz or Birkenau,

Chapter 5.4 shows evidence which I believe proves marks were added to 1944 Auschwitz air photos before their public release in 1979, and **Chapters 6 to 10** show the Treblinka, Belzec, and Sobibor camps from 1940 to 1944 and the Babi Yar Ravine as it looked in 1943.

4. Nothing is hidden from air photos:

Looking at the air photos will be just as if we went back in time to World War II to take a series of airplane flights over the different areas.

Photo 1: Myself looking at a few of the 1.2 million German air photo prints in the U.S. National Archives collection from which half the photos in this book are taken.

Photo 2: Using a microscope to inspect one of the thousands of rolls of 23 centimeter (9 inch) negatives taken by the American military from which the other half of the photos are taken.

Chapter 1

The Development of World War II Aerial Photography

During the 1930's German technicians pioneered the development of aerial photography cameras, high quality lenses, and viewing equipment. From 1939 to 1945 they compiled millions of air photos from flights over Europe and western Russia. Photo interpreters monitored military equipment and troop movements while using stereo viewing magnifiers, which give a 3-dimensional effect by looking at two photos taken one after the other that both photographed the same area on the ground.

Photo 1: A Messerschmitt 110 twin engine air photo plane.

Photo 2: A Lublin, Poland, train station map drawn on an air photo.

Air photos from American library which were taken by Germans are in this book

Photo 3 – After 1945: Americans looking through a German-made stereo viewing magnifier which also allows two people to view at the same time.

At the end of the war the American military seized truckloads of German air photo prints and sent them to the U.S. where 1.2 million were released to the public during the 1980s. The German photos in this book were selected from the collection stocked at the National Archives Air Photo library at Alexandria, Virginia, U.S.A

Chapter 1

American and British air photo development

U.S.-American and British air photo reconnaissance and interpretation developed from being almost non-existent in 1939 to a well-equipped and top-priority program by 1943. Bombing targets such as communication centers, railway stations, power plants, factories, and city centers were photographed, and the developed 23 centimeter (9 inch) prints were studied at field offices and at the large Medmenham interpretation center near London, England, where the U.S.-Americans and British worked together.

Photo 4: (right) A U.S. Army interpreter writes a report while using a stereo viewing magnifier.

Faster higher aircraft combined with larger focal length cameras by 1943

Photo 5: (above) Camera locations in the Mosquito. **Photo 6:** (right) A 36-inch (90-centimeter) camera in position that could obtain large scale images from high elevations.

The twin-engined DeHavilland Mosquito aircraft was modified after 1940 so that it could photograph most areas of Europe after 1941 because:

- (1) radar could not detect it, as it's skin was plywood,
- (2) it flew 600 kilometers (375 miles) per hour at 13 kilometers (8 miles) altitude, and
- (3) it could fly 1450 kilometers to a target and then return.

The Germans were also aware that after 1943 the Mosquito could fly from Italian airfields to photograph Poland.

By 1943 long-focal-length 90-centimeter (36 inch) cameras were developed.

Chapter 1

Camouflage used to bide important or sensitive possible bombing targets

After 1941 the German military was aware that high altitude aircraft were photographing western Europe, and after 1943 they knew all of former Poland could be reached from Italian airfields. They therefore made extensive use of camouflage to conceal and guard important and sensitive installations from being photographed and bombed.

Photo 7 – 1942: (left) Photos taken in Europe before and after a factory was camouflaged using draped coverings and paint.

Camouflage often not successful against air photos

Photo 8: (below) The results of using camouflage were mixed. A factory or weapons storage site could be made to look like a farmhouse to an observer in a plane, but if photographed the building would probably fail to deceive the camera for its ability to record small details and at the same time give an overall view of the building in relation to its surroundings. Two factories determined by air photo interpreters to *be* factories are the camouflaged shoe factory at Wasserburg (left) and the agricultural equipment factory at Baumenheim (right).

Chapter 1

Air photo interpretation used to confirm or dismiss stories from spies

By 1942 spies in Europe were channelling rumors, indications, and ‘eyewitness’ accounts of selected areas to England, which were summarized and given to British or U.S. air-photo interpreters who would study the photos for evidence as to whether these spy reports could be confirmed.

Military commanders placed the highest priority on air photo interpretation reports because they gave positive evidence of a selected target as opposed to rumors and alleged ‘eyewitness’ stories. For example, spies may have submitted evidence that a group of farmhouses were being used to produce aircraft parts, but it wouldn’t be until an interpreter received and could study air photos for evidence such as ground scarring from vehicles, smoke, chimney sizes, fuel storage areas, or changes in the building layout from previous months that a decision could be produced as to whether the spy reports could be confirmed or not.

Photo 9: (left) The largest battleship in the world at that time, the Tirpitz, photographed off the Norwegian coast on July 12th, 1944, to confirm spy stories it was in the area. The British sank it with six-ton bombs after determining its exact location and anti-aircraft defenses from the air photos.

Photo 10: (above) Low-level photos using a camera positioned in the nose of a plane such as the Mosquito were used to obtain information on important potential bombing targets such as this radar installation in Denmark.

Chapter 2

Firebombing Hamburg Creates Largest Fire in History

On Sunday, July 28th, 1943, from 1 to 2 am British planes dropped napalm, phosphorous, and explosive bombs on the Hamm & Hammersbrook residential districts of Hamburg, Germany, to create a firestorm that engulfed a 5-kilometer (3-mile) wide area sending a 2-kilometer (1¼-mile) wide column of flames soaring 4 kilometers (2½ miles) high which pushed superheated gasses a further 8 kilometers (5 miles). To feed the 600-degree centigrade (1200-degree Fahrenheit) firestorm, winds reached 240 kilometers per hour (150 miles per hour) dragging uprooted trees and people into the inferno. (Ref.: Caiden, M., pages 4 to 50)

In oxygen-deprived shelters people suffocated while clawing at blocked exits. On rubble strewn streets people met choking gasses, burning debris, and walls of flame. They scrambled to the Elbe or Alster Rivers writhing in pain from boiling asphalt and burning phosphorous. Children were dragged into the flames or stuck to boiling asphalt. Thousands simply vaporized. Many who reached the rivers died unable to stop the burning phosphorous.

For 10 days from July 24th to August 2nd, 1943, British night and U.S. day bombing completely demolished a seven-kilometer (4½-mile) wide area and severely damaged a 12-kilometer (7½-mile) wide zone destroying 300,000 dwellings and killing over 100,000 people.

In cellars rescuers found shriveled remains and melted pools of glass, bones, and fat. Grotesque charred figures littered the streets.

Unrecognizable bodies were loaded into trucks and driven to Ohlsdorf cemetery in the northern section of the city. Here four mass graves, each measuring 130 meters (426 feet) long and 16 meters (52 feet) wide, were dug in the sandy soil in the form of a cross by workers assisted by a mechanical excavator. Truck drivers approximated the numbers in their loads before the unidentified bodies were raked into the pits. Each of the four graves held an estimated 10,000 bodies. The bombing of Hamburg was over.

(Ref.: Middlebrook, M., pages 356-366, & plate 40)

Photo 1 – July 1943: Three of the charred corpses that were most likely driven to the Ohlsdorf cemetery for burial. There was no attempt to identify thousands of the blackened shriveled corpses.

Photo 2: The Nikolaifleet waterway in the Altstadt before the 1943 bombing.

Photo 3 – taken after July 1943: A half-kilometer-wide (1,600 ft) section of the seven-kilometer wide (4½ mile) area destroyed in the fire-bombing. Only walls stand in these five-story buildings. This oblique photo would not have been as useful to British and American air-photo interpreters assessing the damage as the vertical air photo below.

Photo 4 – taken shortly after July 1943: In this photo of downtown Hamburg between the narrow canals, about a third of the buildings were reduced to rubble and two thirds were completely burned out with only their walls left standing.

Chapter 2

Photo 5 – taken after 1950:

One of the four mass graves in the Ohlsdorf cemetery. The district names which were bombed are on the signs, including Hammersbrook and Hamm directly in front of the brick memorial. The graves were built in the form of a cross so that access could be gained from all sides and the piles of dirt would not interfere with the work. The grave sizes are shown on the right.

(Ref.: Photos 1, 2, 3, 5 – Middlebrook;
Photo 4 – British Air Ministry)

Chapter 3

The Katyn Forest 1940 Executions

From 1931 to 1939 the Soviet state police had erected fences and placed signs to prevent local villagers from entering a one-square-kilometer section of the Katyn forest they considered their private reserve. Located 15 kilometers (9 miles) west of Smolensk, a narrow road led one kilometer ($\frac{5}{8}$ of a mile) through the forest of 10- to 15-meter (30- to 45-foot) high spruce and pine trees to their 'interrogation' castle on the Dnieper River. In February 1940 dog patrols started. (Ref.: Paul, Allen, page 112-120, and Anders, W., pages 19.)

When ordered in the winter of 1940 to execute thousands of Polish prisoners of war, they had large graves dug near the center of the forest on the side of the narrow winding road. In 1940, from April 3rd to May 11th, 4,400 prisoners were moved by train and then by Soviet 'Black Raven' windowless trucks four kilometers to the graves. Many struggled while being bound as evidenced by bayonet wounds, broken arms, legs and jaws, as well as sawdust stuffed into mouths. Each received a single shot in the back of the head. (Ref.: Lauck, John, pages 18-21)

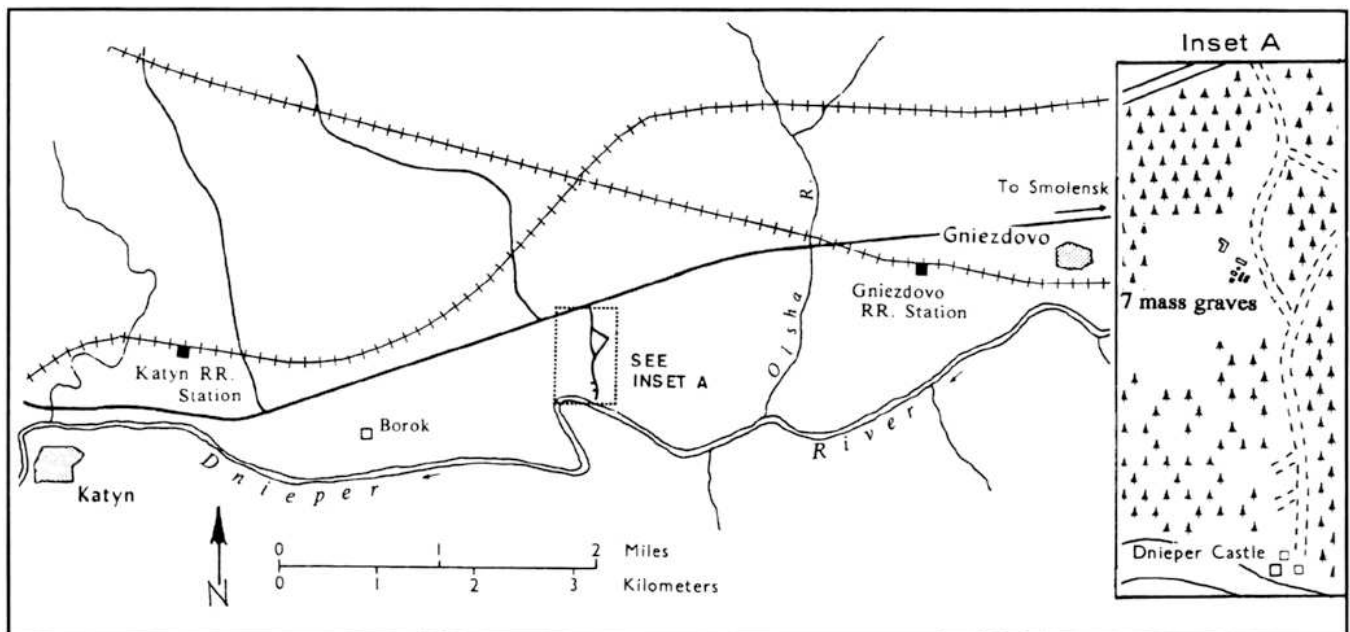

The largest grave was 35 meters (115 feet) long,

8 meters (26 feet) wide, and 3 meters (10 feet) deep, holding 2800 neatly stacked bodies. Added end to end, the seven graves measured 96 meters long and 6 meters wide. In May 1943 pine trees were planted in the cleared area. (Ref.: Anders, W, pages 191-196)

The German army, which occupied the area from July 1941, did not discover the gravesite until February 1943, after they had searched with villagers who remembered being near the railway station in 1940 and seeing prisoners being driven towards the forest. From April to August 1943 the Germans dug up and identified 4,143 bodies while hosting international delegations of forensic experts. In August another 250 bodies were found in an eighth grave, but there was no time to exhume them.

(Ref.: Lauck, John, pages 18-26)

In September 1943 the Soviet army reoccupied the area and conducted their own investigation digging up 950 bodies and blaming the Germans. In 1990 the Soviet government admitted responsibility.

Map 1: The mass graves are labeled in the middle of Inset A. (From: Lauck, John, *Katyn Killings*.)

Photo (a): From an airplane looking southeast across the mass graves and entrance road at the top of the photo. Numerous bodies have been placed next to the graves in order to be identified.

Photo (b): Among the observers who viewed one of the rectangular-shaped three-meter-deep mass graves were some Canadian, British and U.S. prisoners of war shown in this photo.

Photo (d): (above) A large number of the victims were found with their hands tied behind them.

Photo (c): (left) The bodies were entangled with each other and it took many workers months to dig them up.

Photos (a) to (g) are from:
Auswärtiges Amt [German State Dept.], *Amtliches Material zum Massenmord von Katyn*. [Official Material about the mass murder of Katyn], images 3(a), 11(b), 5(c), 36(d), 22(e), 16(f).

Photo (e): A group of European journalists overlooked the largest mass grave.

Photo (f): Professor Buhtz showed a group of European forensic specialists some of the methods the Germans used to identify the bodies.

Chapter 3

Photo 1 – Location:

Katyn forest

Dnieper River

Gniezdovo rail station

Goat's Wood section of the Katyn forest

Dnieper River

Photo 2 – January 2, 1944: The 'Goat's Wood' section of the Katyn forest is in between the straight Smolensk-to-Orsha roadway and the river. The ground surface is wavy with small hills, ridges and depressions because of the thick deposits of rock and soil that were deposited by glaciers which covered the valley about 12,000 years ago. Sound is transmitted poorly over this type of surface.

Chapter 3

**Photo 3 –
Sept. 2, 1942:**

Dnieper River

probable mass-gravesite

Photo 4 – July 9, 1941: This picture was taken just fourteen weeks after the executions ended. The photo is not completely vertical but was taken at a slight angle. It does however show the boundaries of the forest in relation to the cleared areas. The access road is not visible through the thick foliage. Some trees may have been cut down a week after this photo was taken when there was heavy fighting in the area. The clearing in the center is most likely the mass-gravesite.

Chapter 3

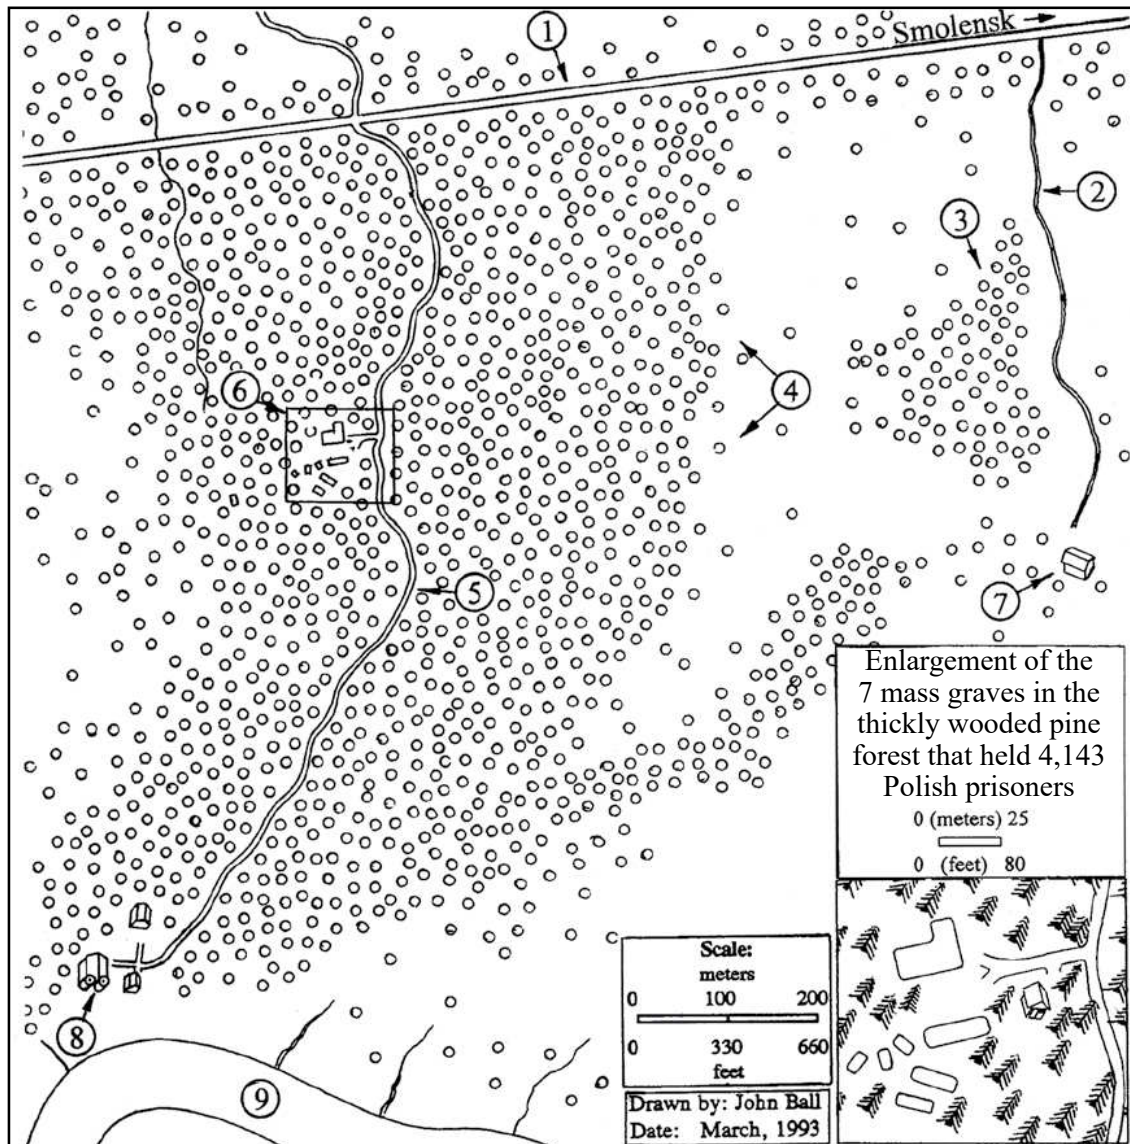

Photo 5 – Sept. 2, 1942: The gravesite area cleared of trees is on the left of the one-kilometer ($\frac{5}{8}$ -mile) road from the highway to the river. The graves were not discovered by the Germans until February 1943 after searching with villagers who had seen prisoners driven towards the forest. However, if the Germans had listened to rumors of executions from local people in 1941 or 1942 and had looked at air photos to recognize the only cleared area in the forest, they might have found the graves earlier.

Chapter 3

Schematic drawing of Katyn Forest

Legend:

- | | |

| 1 main road from Smolensk 15 kilometers (9 miles) | 7 the closest building to the gravesite, where an older couple who were beekeepers lived in 1940 |
| 2 foot and horse trail | 8 Soviet state police buildings used between 1935 and 1941. After July 1941 it was a German communications center, and although staff drove the road, they didn't find the graves until a hungry wolf led them to search the roadside area with villagers, 1.5 years later |
| 3 pine trees | 9 Dnieper River |
| 4 Goat's Wood section of the Katyn Forest that was partially fenced in and guarded with dog patrols in 1939 and 1940 to prevent unauthorized entry | |
| 5 narrow winding road | |
| 6 enlarged area where 4,143 prisoners were dragged from trucks, bound, shot, put in graves, and where pine trees were later planted to conceal the graves | |
- Map drawn from 1940 to 1944 air photos (see previous pages and next page).

Chapter 3

Photo 6 – Oct. 13, 1943: (above) In a one-kilometer ($\frac{5}{8}$ of a mile) radius from the gravesite across the uneven glacial deposits there are no houses other than the Soviet police castle on the river and a building on the right side of the picture one kilometer from the gravesite (shown in the box). The Soviets had re-occupied the area one month before this photo was taken, but they had not yet disturbed the seven mass graves which the Germans had built to rebury the ex-humed bodies.

Photo 7: (left) The ‘interrogation’ castle on the Dnieper River used by the state police. (Ref.: Auswärtiges Amt, image 4, bottom).

Chapter 3

Photo 8 – October 13, 1943: To ensure that none of the local villagers would witness prisoners being unloaded from trucks, executed and buried, the Soviet state police in 1940 dug mass graves near the center of a fenced-in one-square-kilometer (0.6-square-mile) thickly wooded section of the Katyn Forest beside the narrow winding access road.

Chapter 3

Photo 9 – Oct. 3, 1943: (left) Smolensk located 15 kilometers (10 miles) east of the gravesite. This is three weeks after there was heavy fighting in the area. The roofs are missing from almost every building, and vehicles are visible crossing the one rebuilt bridge.

Dnieper
River

Photo 10 - October 3, 1943: (left) Heavy fighting occurred in the Smolensk area in July 1941 and again in September 1943. The burned out buildings are just a small indication of the devastation.

Chapter 4

Thousands of Typhus Victims Buried by British in Bergen-Belsen

Bergen-Belsen was established in April 1943 as a detention and transit camp. In 1944, from July to December, 1,900 Jewish people from the camp emigrated to Israel. From September 1944 to March 1945 over 25,000 former inmates of Auschwitz and other camps arrived. In early 1945 an outbreak of typhus spread through the camp killing thousands of inmates.

British troops arrived on April 15th, 1945, to see thousands of emaciated corpses of typhus victims. They immediately prevented anyone from leaving, and earth-moving machines were brought in to dig mass graves in the southern part of the camp beside the former crematorium. (Ref.: Gutman, I., pp. 185 to 190)

The sizes of the graves were:

1. One large pit measured 20 meters (65 feet) long and 7 meters (23 feet) wide, and held an unknown number of bodies.
2. About four other pits each measured about 15 meters (50 feet) long and 6 meters (20 feet) wide and also held an unknown number of bodies.

(Measurements were taken from the air photo on page 33.)

Inmates were moved from the southern part of the camp, and sometime after April 25th flame throwers burned the infested buildings.

(Ref.: Bloch, S., *Holocaust ... in Bergen-Belsen*)

Photo 1 – about April 20th, 1945: Emaciated bodies being thrown into one of the mass graves dug by the British. From this photo the grave appears to be about 3.5 meters deep, and the walls are steep, but they are not caving in.

Chapter 4

Photo 3 – about April 20th, 1945: (above) One of the mass graves about to be covered with earth.

Photo 2 – August 28, 1945: (left) The Bergen-Belsen camp. Ground scars remain from about 60 buildings that were destroyed. Records show that British troops brought in flame throwers and in May burned the barracks to control the spread of typhus.

To the right of the square field at the bottom of the photo mass graves had been filled in four months earlier. They are seen as irregular rectangular or round white patches.

Chapter 4

Photo 4 – April 25, 1945: (above) This is ten days after the British entered the camp. They have excavated mass graves to the right of the square block in the center of the photo. One large pit appears open. The smaller, more symmetrical pits to the left of the fence could have been dug by the Germans.

Around the mass graves there are a lot of ground scars from vehicles moving earth around, and four or five of the pits appear to have been covered with earth fill. The one large grave could be in the process of being filled with corpses. It measures 18 by 7 meters (60 by 23 feet) and has a pile of dirt 11 meters (36 feet) wide on either side. At least three vehicles are just to the north of the grave.

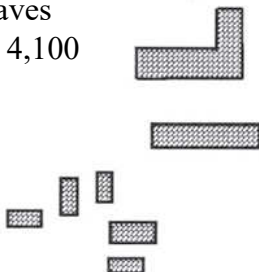

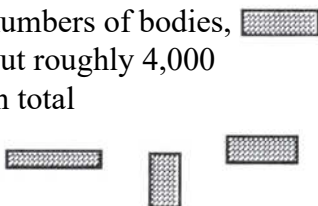

Photo 5 – April 1945: (left) The British inspecting the single open-air crematorium in which the Germans were burning corpses.

Ref.: Photo 1, 3, and 5 from Bloch, S., *Holocaust in Bergen-Belsen*.

Summary of Chapters 2, 3 and 4

Comparing the sizes of the mass graves at Hamburg, Katyn, and Bergen-Belsen

Name:	Particulars:	Size of mass graves:								
Hamburg	When excavating the wide graves, spoil was piled on the sides. If the long trenches had been parallel to each other, at least 10 meters (33 feet) would have had to be left in between each trench to be able to pile this amount of excavated dirt. The depth of the graves is assumed to have been 3.5 meters (11 feet). Total volume of graves: 7,280 m³. Density: ca. 1.4 corpse per m³.	<div><div>each of 4 graves held 10,000</div><div>each grave was 130 meters (426 feet) long</div><div></div><div>by 16 meters (52 feet) wide</div></div>								
Katyn	The average depth of the graves was about 3.5 meters. They had steep walls, because the organic-rich soil in the forest held together well. The bodies were neatly stacked in the graves to allow more room. It took the Germans two months to dig up or exhume 4,100 bodies. Total volume of graves: 2,016 m³. Density: ca. 2 corpses per m³.	<div><div>7 graves held 4,100</div><div></div><div>placed end to end the 7 graves were 96 meters (315 feet) long by 6 meters (20 feet) wide</div></div>								
Belsen	Earth was pushed out by a mechanical excavator to piles on either side of the graves. The graves were dug about 30 meters apart to allow room for depositing the spoil. The depth of the pits was about 3.5 meters. Total volume of graves: ca. 2,000 m³. Density: ca. 2 corpses per m³.	<div><div>held an unknown numbers of bodies, but roughly 4,000 in total</div><div></div><div>one of the graves was 20 meters (65 ft) long by 7 meters (23 feet) wide</div></div>								
grave sizes needed to bury large numbers of corpses	<p>Accepting the figure of 10 meters (33 feet) between the graves 3.5 m deep to hold the excavated dirt, then:</p> <p>The area needed to bury 25,000 corpses is</p> <p><u>100 x 100 meters (325 x 325 feet)</u></p> <p>The volume needed to bury 25,000 corpses at 2 corpses per m³ is</p> <p><u>50,000 cubic meters (1,766,000 ft³)</u></p> <p>Of course many more corpses could theoretically fit into one cubic meter. Chapter 5: Auschwitz

Chapter 5.1:

One Million Alleged Gassed and Cremated at Largest Extermination Camp

Thirteen of the most generally accepted allegations:

1. Auschwitz I was set up in 1940. Some of the first victims were Polish officers who were tied up and shot through the back of the head by a German, who started the practice of shooting people this way.

(Ref.: Central Commission for Investigation of German Crimes in Poland, page 80-81).

2. Auschwitz I and Birkenau were each encircled by an outer chain of 50 to 60 watchtowers at a radius of 2 kilometers. The two circles almost touched at one point with only the railroad line in between. (Ref.: McClelland, R., page 1)

3. One kilometer ($\frac{5}{8}$ of a mile) out from the barbed wire fences around the camps a chain of guard posts were guarded by SS men.

(Ref.: Gutman, I., page 113)

4. In 1944 at the Birkenau train platform, the majority of arriving inmates were directed to the gas chambers and the remainder to forced labor. (Ref.: Gutman, I., page 109)

5. At the Birkenau Crematoria II & III, victims were marched to the underground undressing rooms and herded into gas chambers. Then prisoners took corpses to the cremation furnaces. (Ref.: McClelland, R., page 11)

6. At the smaller Birkenau Crematoria IV & V (all rooms on ground level) victims had to undress in an undressing room and were herded into gas chambers before prisoners took corpses to the cremation furnaces, which incinerated them at a rate of 1,000 per day.

(Ref.: Pressac 1989, page 384)

7. Each of the two large Birkenau crematoria (I & II) worked continuously to burn 175 bodies per hour or 4,200 per day.

(Ref.: Sehn, J., page 137; Pressac 1989, page 253, claims a capacity of about 3,000 per day)

8. Coal and firewood for operating the crematoria were brought by road.

(Ref.: Sehn, J., page 137)

9. The bodies of all the Jews that were being gassed could not be burned, so in May 1944 six huge pits were dug beside one of the smaller crematoria (no. V), and bodies were continuously burned in them from May to September. With prisoners helping, many thousands of bodies were burned in the pits on pyres of logs each day.

(Ref.: Sehn, J., page 140. Central Commission for Investigation of German Crimes in Poland, page 88)

10. From March 1942 to September 1944 more than a million people, or about 1,000 per day, were gassed and cremated at Birkenau.

(Ref.: Piper, F., page 117)

11. The few not sent to the gas chambers went to the disinfection facility, where they received a haircut, a shower, and a change of clothes before being assigned a barrack. In the labor camps the average life expectancy was a few months.

(Ref.: Gutman, I., page 109).

12. In Birkenau the Auschwitz Fighting Group started in 1943 to monitor activities in the camp and to organize escapes, sabotage, and political action while keeping in touch with other spy groups outside the camp.

(Ref.: Gutman, I., page 115)

13. The Soviet Red Army entered Auschwitz in January 1945 and found the Nazis had destroyed the crematoria and gas chambers before they left. (Ref.: Central Commission... Poland, page 91)

Chapter 5.2

The I.G. Farben Coal Liquefaction Complex

The I.G. Farben coal liquefaction complex was one of the large construction projects of the Auschwitz area. It was started in 1940 and 1941 to produce synthetic oil and rubber from coal together with gasoline, liquid chlorine, and metals such as aluminum.

The approximately 100,000 civilians who worked at the plant from 1941 to 1944 were engineers, chemists, mechanics, metal workers, construction workers and laborers. The Auschwitz camp system was established in 1941 to supply labor, and about 25,000 inmates worked at the complex.

(Ref.: Central Commission for the Investigation of War Crimes in Poland, page 37)

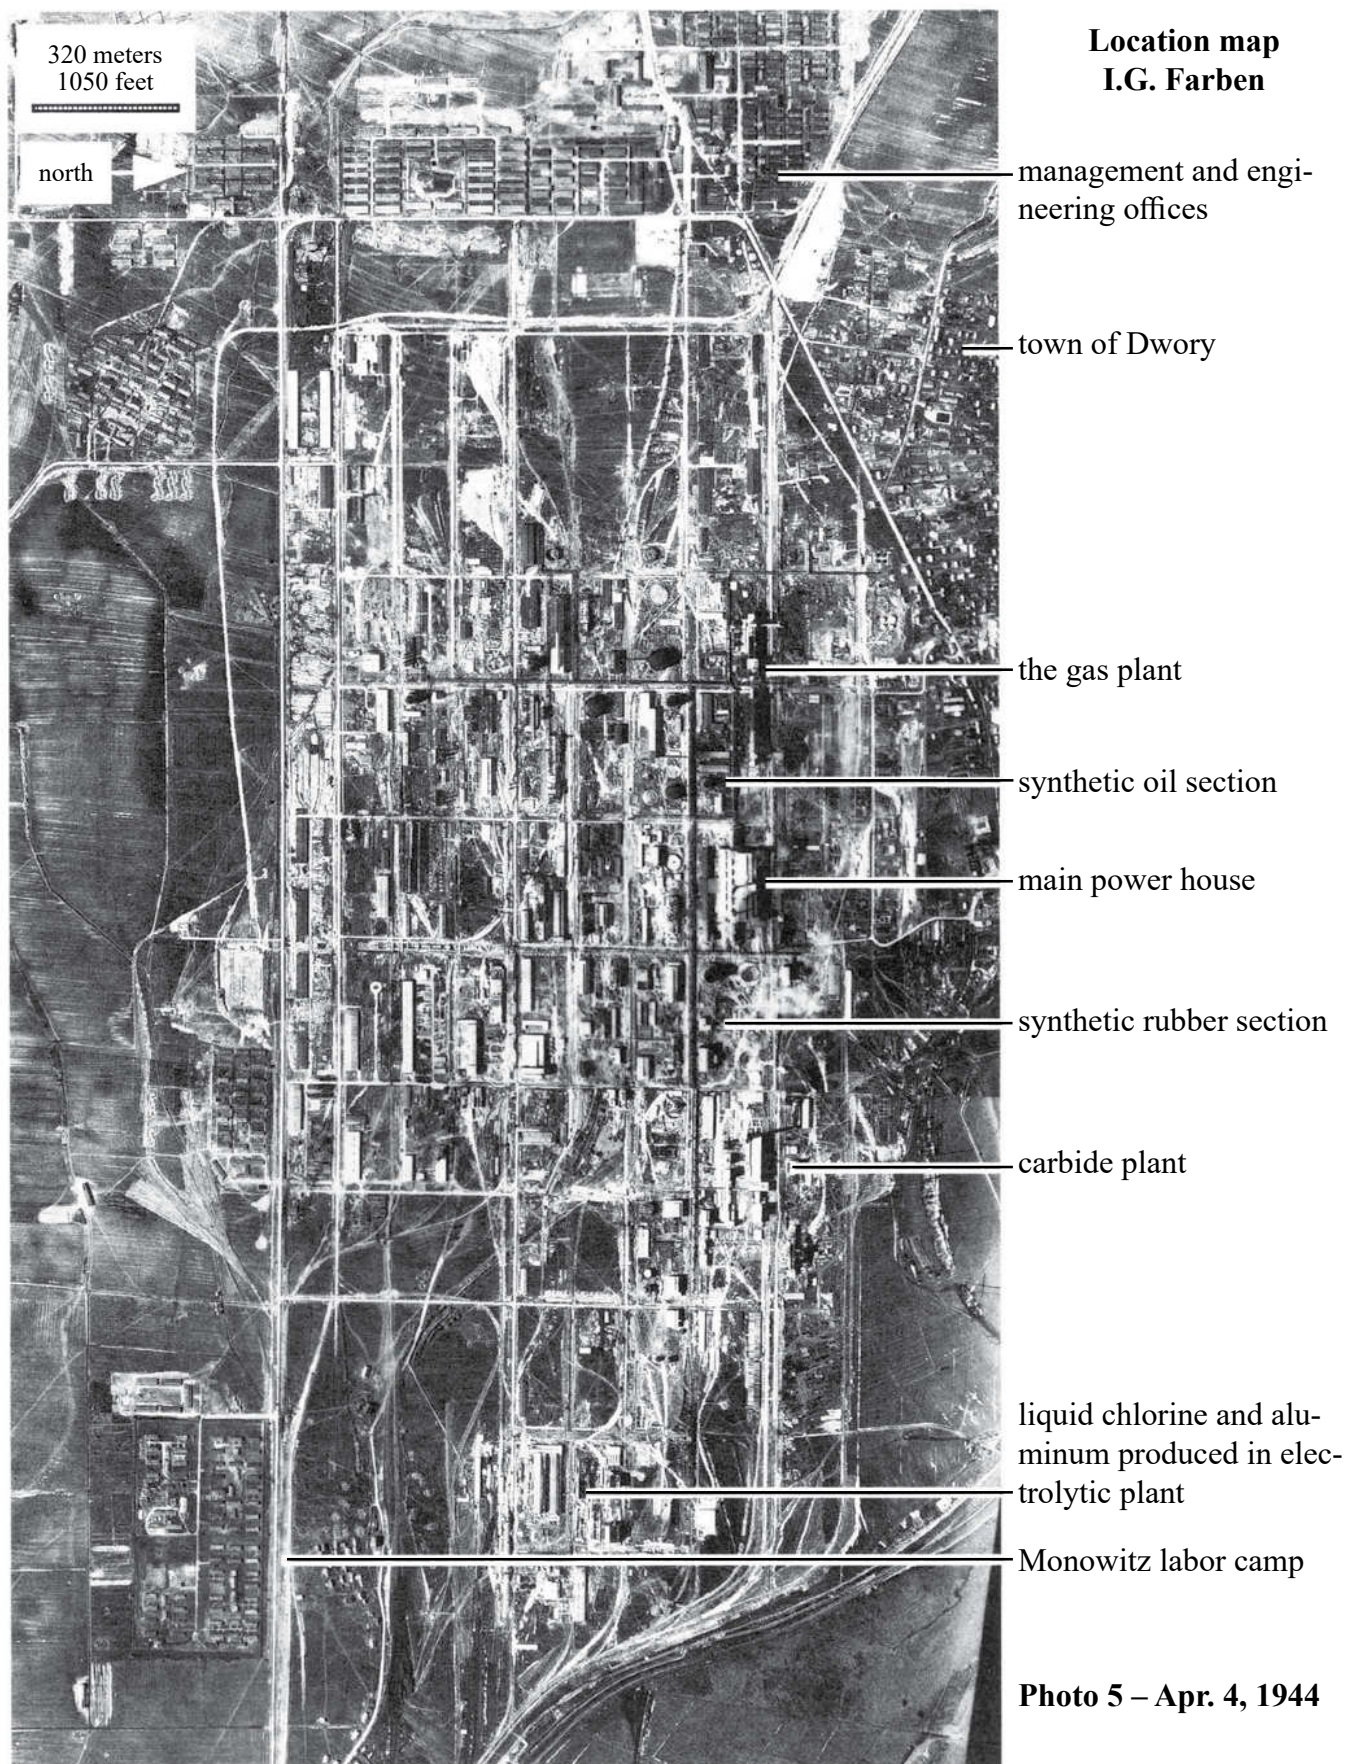

The first air photos were exposed on April 4th, 1944, and the earliest interpretation report on record is from June 9th, 1944, which describes the equipment most likely contained in each building and the amount of a particular product it could produce. The estimated production was:

1. 150,000 tons per year of synthetic oil with equipment to increase that to 350,000 tons per year, or 50 % of the largest producer at Blechhammer, Germany,
2. 20,000 tons per year of synthetic rubber equal to the largest producer at Hüls, and
3. aluminum and liquid chlorine produced at the electrolytic plant, together with gasoline.

Photos: 1 (top left) power plant, 2 (top) & 3 (bottom left) synthetic rubber section, 4: synthetic oil area.

Chapter 5.2

May 1943 map

(next page)

The May 1943 map accompanied a report dated January 21st, 1944, prepared before air photos were available

Map 1 – May, 1943 (on next page):

Following are a few sentences of a 4-page January 21, 1944, report written by U.S. military officers from information which had been supplied by spies in the I.G. Farben industrial plant area sometime after May 1943:

“We do not have air photos of this plant. Ground reports make it possible to say a very large chemical works and a substantial sized synthetic rubber plant has been constructed If there is a synthetic rubber plant producing at the rate of 20,000 tons per year (some reports indicate output as high as 40,000 tons) the target is well worth attacking.

“After the area has been photographed interpreters will be able to judge whether intelligence reports of large scale buna production are valid. Photography will determine how much each of the buildings are producing... All that is available at present is a rough plan drawn from memory from intelligence sources which describes the location of several main buildings.”

Taken from:

Aiming Point Report, January 21st, 1944.

Evidence shows that before January 1944 the military in England were receiving spy reports from the Auschwitz camp area about the industrial operations.

April 9th, 1944 map

(page after next)

The April 9th, 1944, map was drawn using the April 4th, 1944, air photos and accompanied a six page comprehensive report dated June 20th

Map 2 – April 9, 1944 (on page after next):

The report starts:

“This report has been prepared from interpretation of air photographs and a consideration of information from available ground sources... The present equipment points to an output about half that of Blechhammer... Gas capacity is judged by the size of the gas plant, and there are 12 gas purification stalls instead of 26 at Blechhammer... The ultimate capacity is therefore about 350,000 tons per year.”

The report stated what equipment each building contained and what function the building served in the production of oil, rubber, or other products.

Descriptions from this same interpretation report are on pages 43f.

Taken from:

Interpretation Report No. D.389, June 9th, 1944.

Evidence shows that before June 9th, 1944, air-photo interpreters in Britain had recognized what each building in the industrial area was used for and how much of a product it could produce.

Map – May 1943

to accompany
Aiming Point Report IV.D.4.
21 January 1944

Key to Sketch
I.G. Farben, Oswiecim, Silesia,
(synthetic rubber)

Camps

- 2 camp: various nationalities
- 3 camp: Polish & Czech workers
- 4 camp: French workers
- 5 camp: white collar workers
- 6 camp: Hitler youth
- 7 camp: punishment for recalcitrant workers
- 8 camp: Ukrainian workers
- 9 camp: Polish & Czech workers
- 10 concentration camp for Poles, Jews, Czechs, etc.

Synthetic Oil Plant

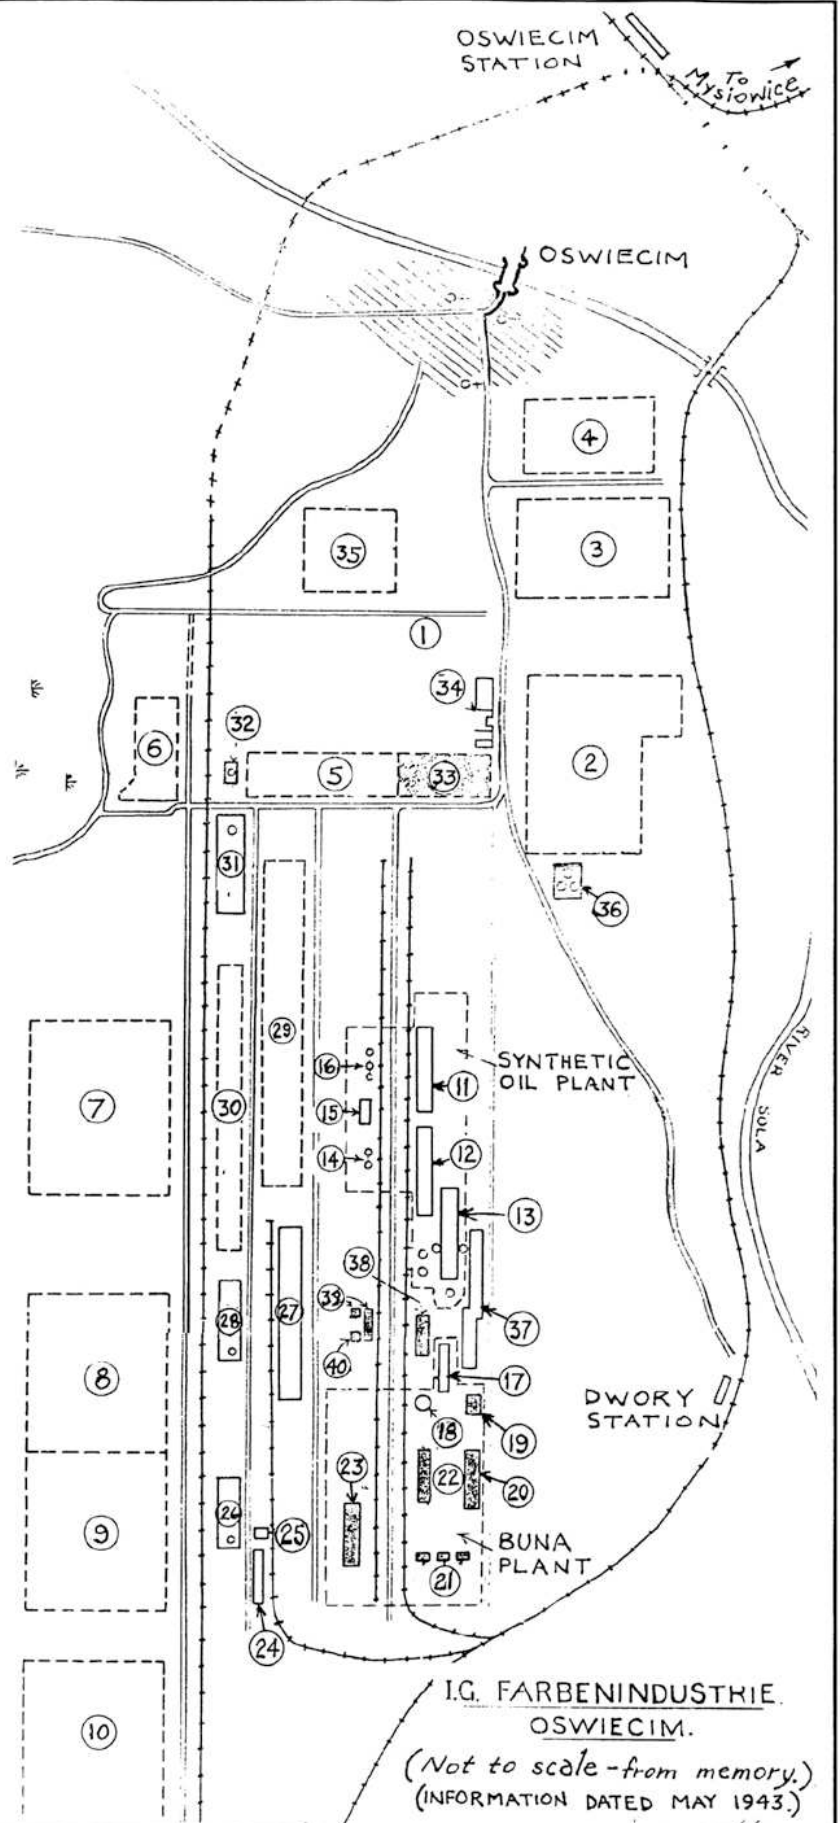

- 11 methanol plant
- 12 methanol plant
- 13 gas plant, holders, compressor
- 14 methanol filtration towers
- 15 suspected laboratory

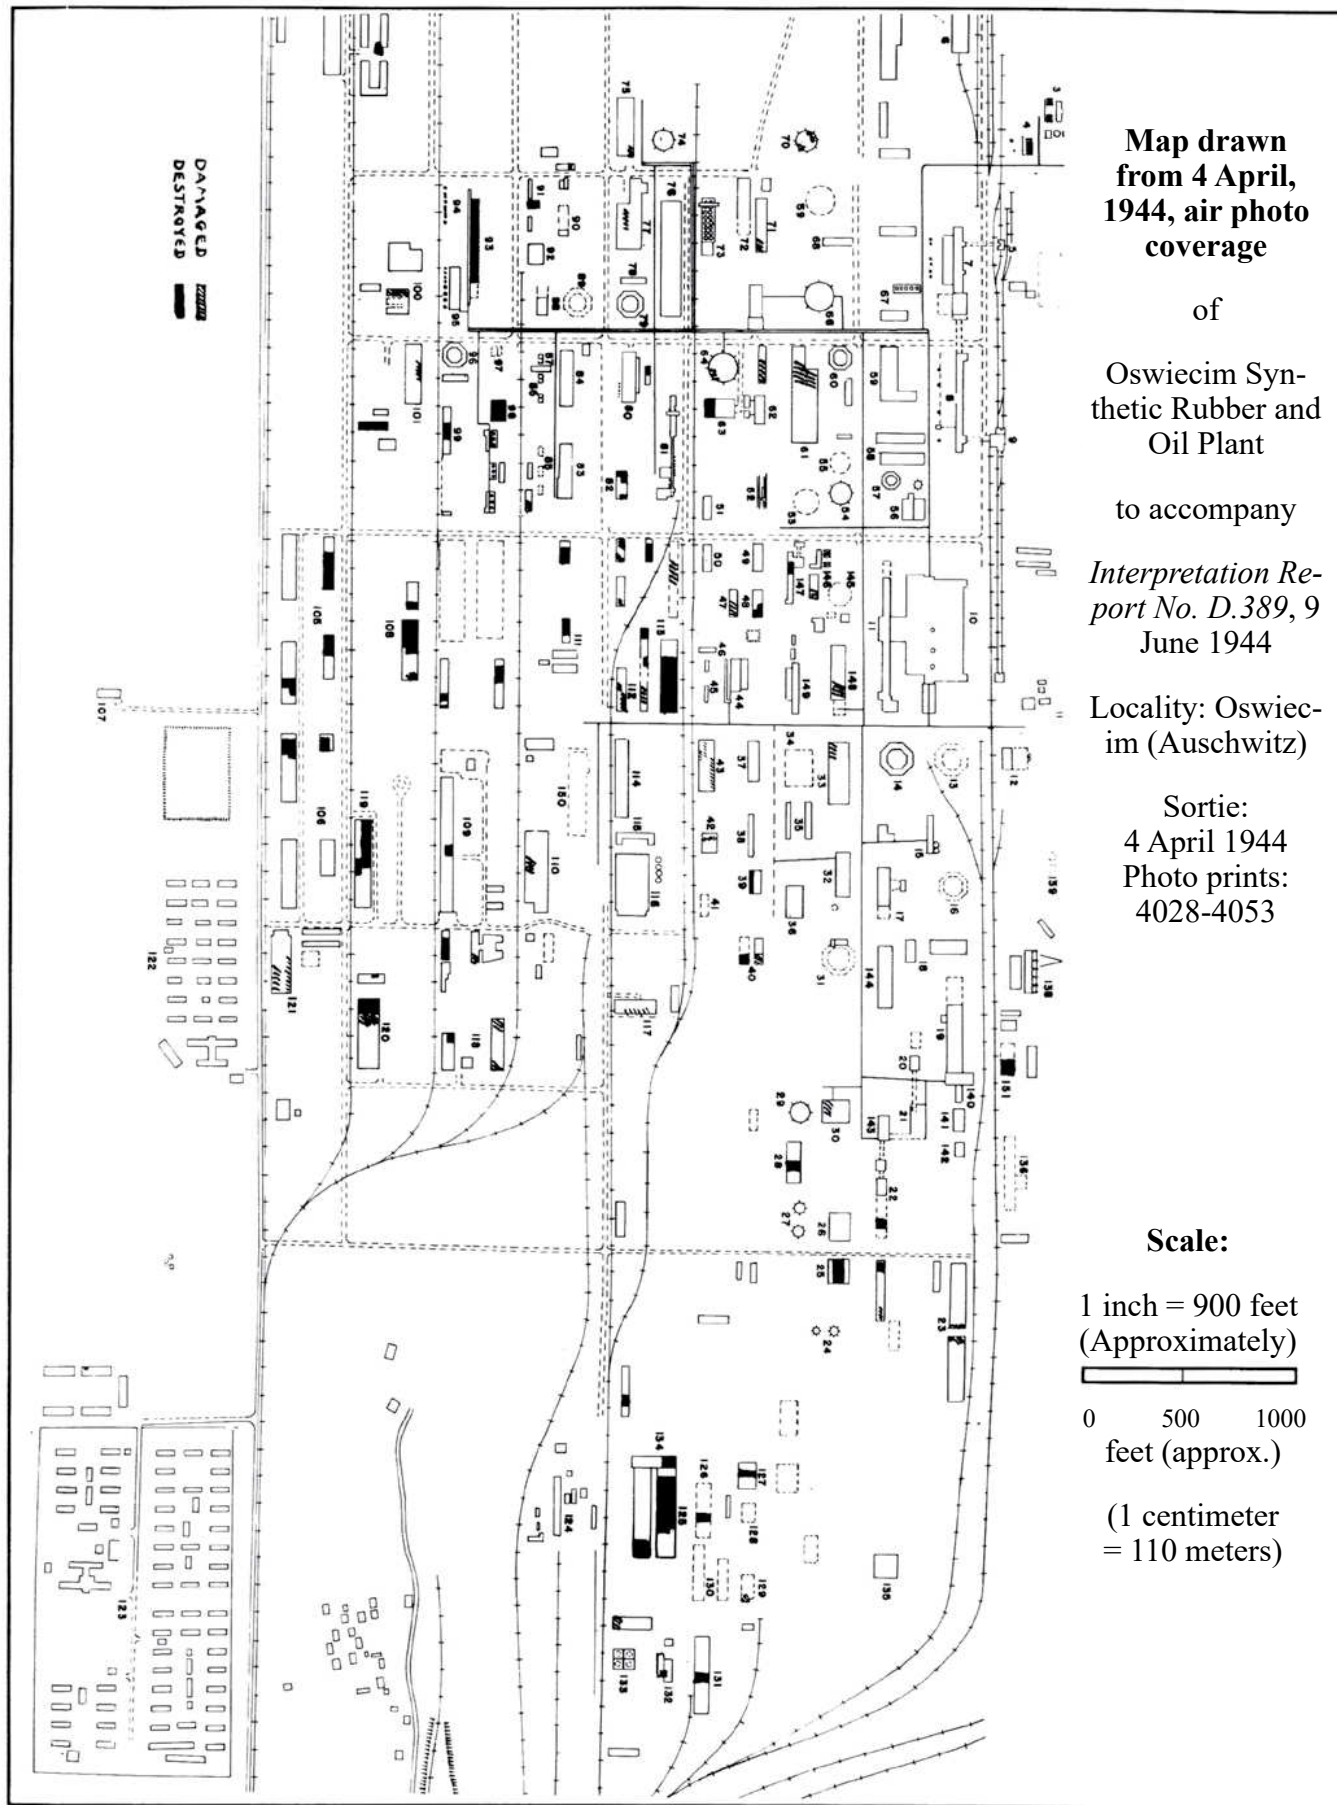

Buna Rubber Plant

- 17 workshop
- 18 large gas holder
- 19 carbide furnace, tall chimney
- 20 carbide factory
- 21 buildings helping buna output
- 22 buna plant
- 23 buna plant

Miscellaneous Buildings

- 24 storage – large electrical gear
- 25 storage – small electrical gear
- 26 boiler house
- 27 storage – plant equipment
- 28 boiler house
- 29 buildings under construction
- 30 construction workshops
- 31 boiler house
- 33 plant construction offices
- 34 garage and fire department
- 35 barracks – white collar workers
- 36 main boiler house
- 37 main transformer station
- 38 plant operations offices
- 39 offices

Chapter 5.2

Interpreters used their knowledge of industrial buildings to describe the gas plant

56 meters
180 feet

Photo 6 – April 4, 1944:

A few sentences of the detailed description of the gas plant in the June 9th, 1944, interpretation report:

“The plant provides gas for the synthetic oil section. One plant is 140 meters long and is fed from a coal pile. Three of the retorts are roofed over, and the tar extractors are in position. One chimney is emitting white smoke, showing the retort is in use.”

“A square section of the building most likely houses coke crushers and screens.”

“The second plant is 150 meters long and is fed by a conveyor from a pile of coal in a bunker beside a rail spur. It’s served by a blower house and cooled by a pump house and tower.”

“Gas is passed to the raw gas holder, the hydrogen sulphide removal plant, and the compressor plant (before going to the refinery for the production of oil).”

Chapter 5.2

Even future construction plans to expand production could be recognized in air photos

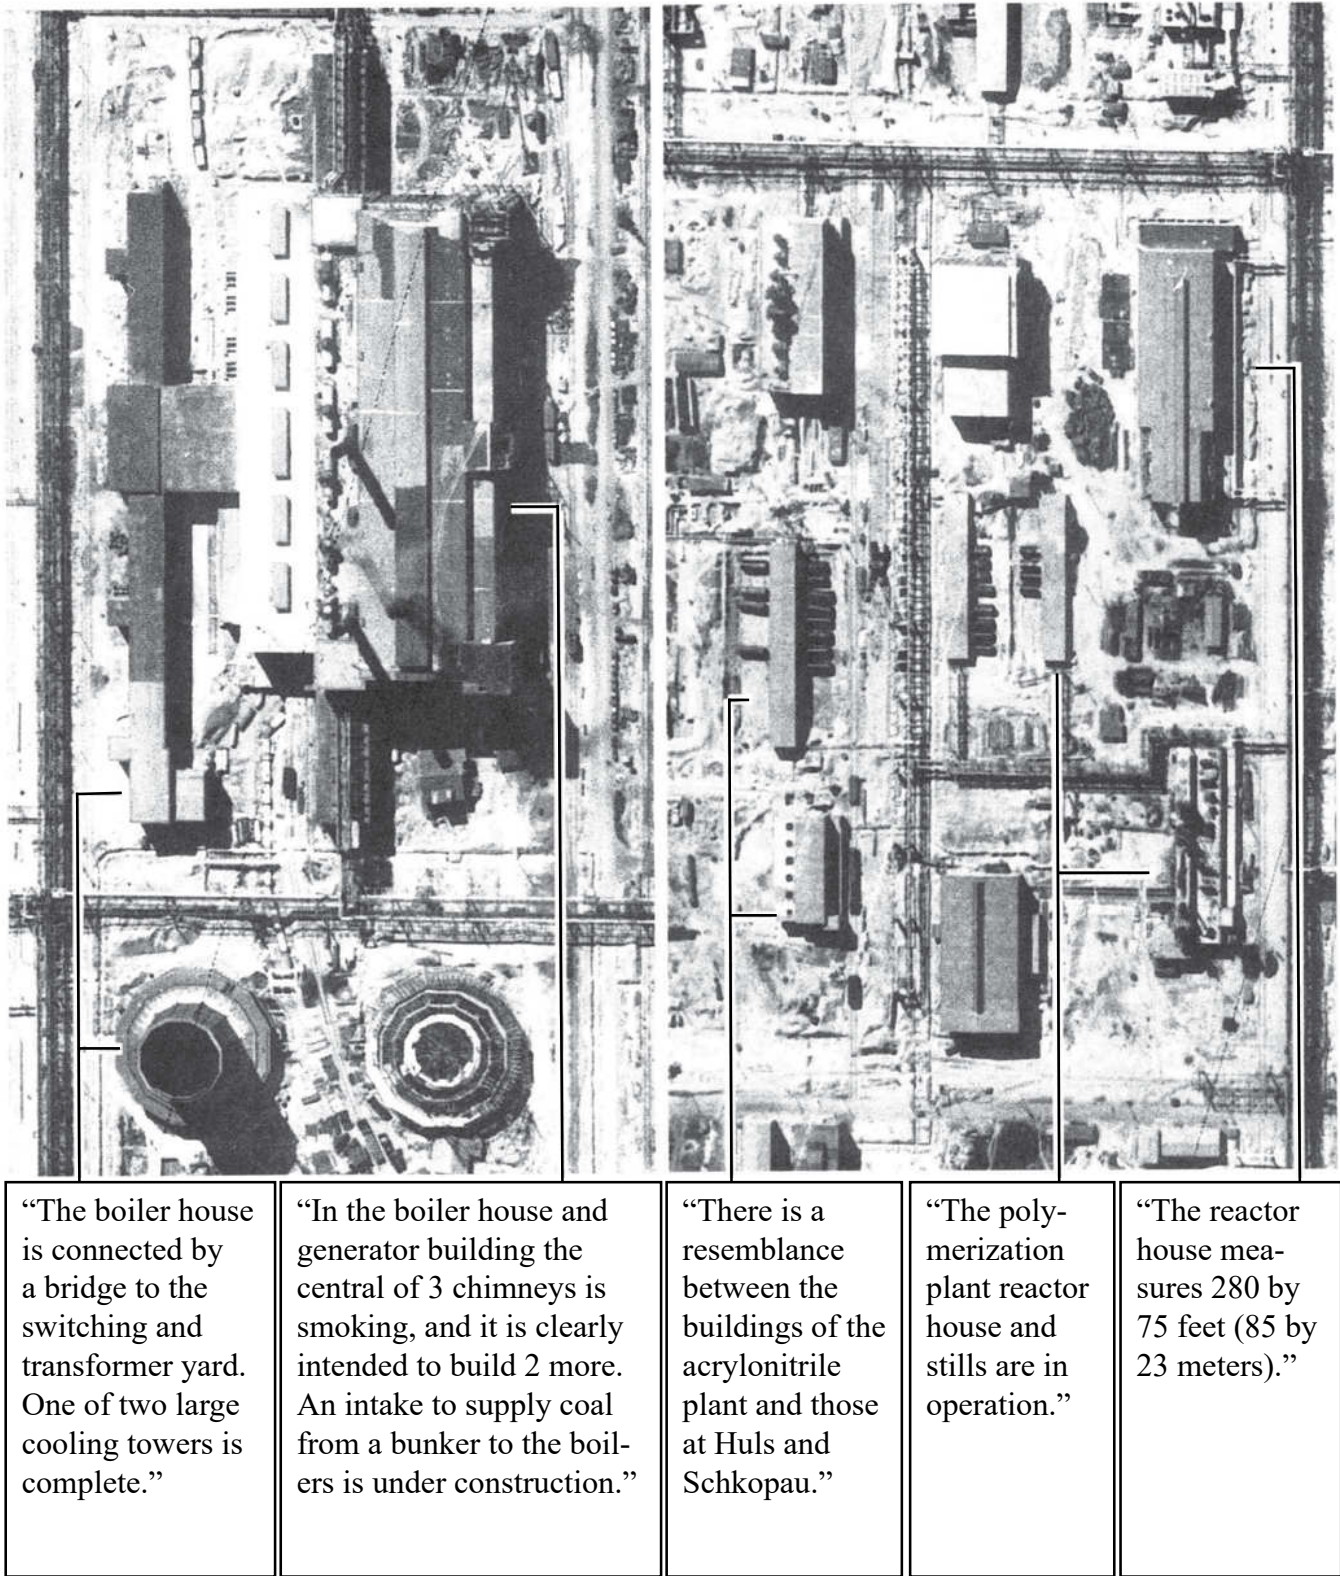

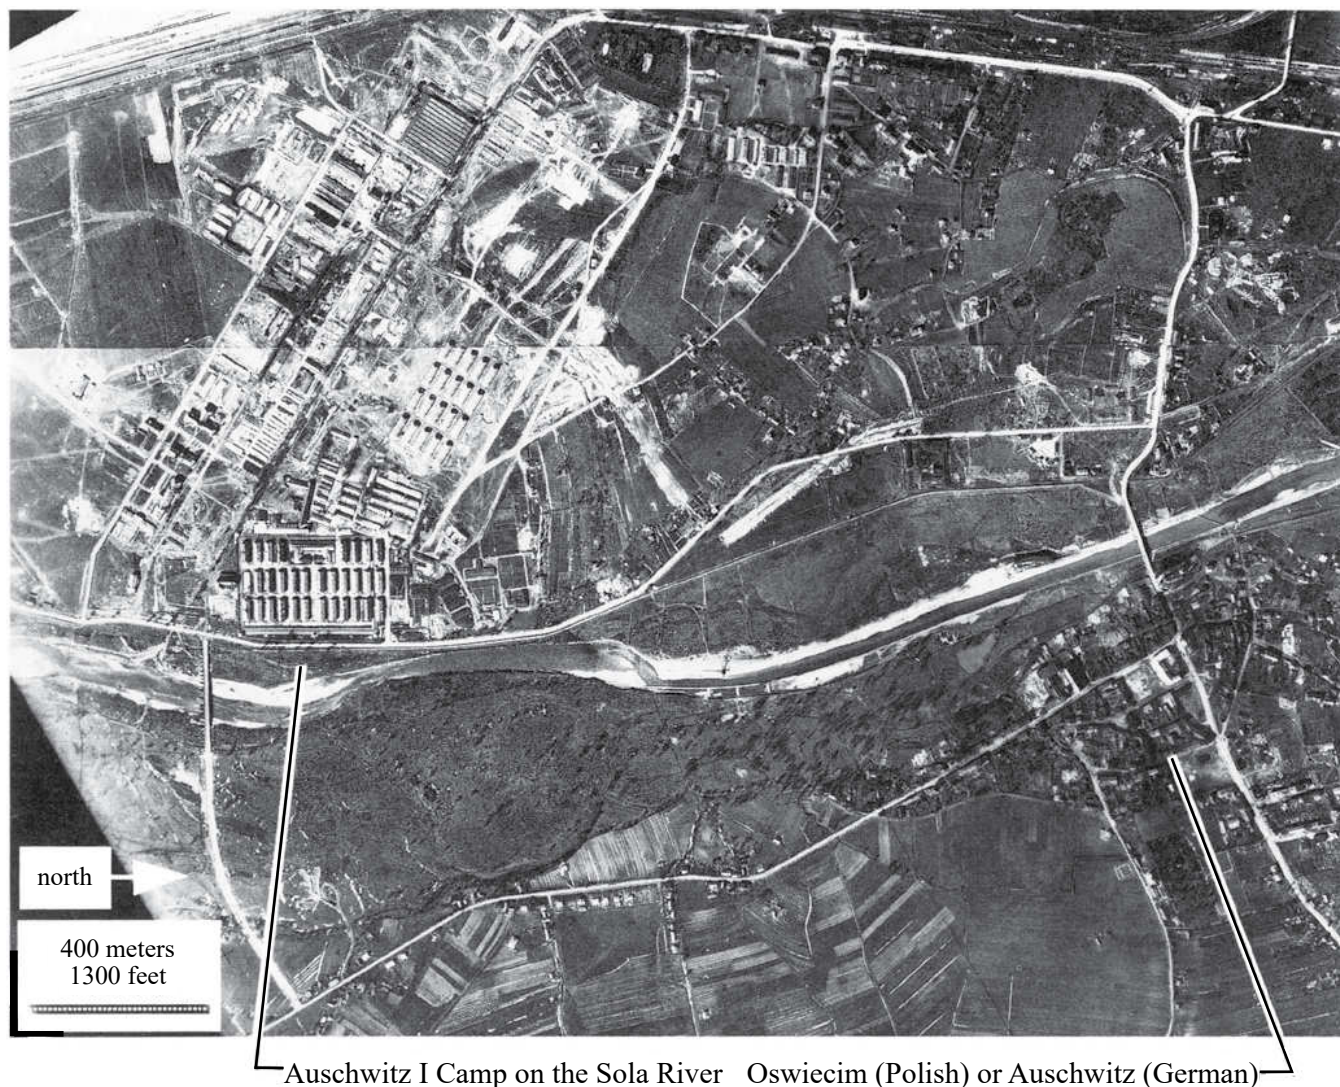

Photo 7 – April 4, 1944: (Scale: same as Photo 4)
 Taken from June 9, 1944, interpretation report.

Photo 8 – April 4, 1944: Scale = same as Photo 2,
 1 centimeter = 28 meters, 1 inch = 225 feet

| | 22 concrete wall 3 metres (10 feet) high around two sides of camp blocked view from Sola River road |

Chapter 5.3

Schematic Map of the Auschwitz camps and some features of the Auschwitz I Main Camp

- | | |
|--|---|
| 1 main roads connecting the villages and train stations with the camps | shops and other work facilities for camp inmates |
| 2 industrial buildings and farmhouses | 10 Auschwitz I Camp |
| 3 Plawy village | 11 Zasole village |
| 4 Folwark Ozernichow village | 12 2 kms. (1¼ mile) north-east to Oswiecim (Polish, German Auschwitz), 1944 population was 20,000. |
| 5 wire fence around Birkenau Camp | 13 SSola River |
| 6 Auschwitz train station | 14 5 kilometers (3 miles) east to large chemical plant of the I.G. Farbenindustrie AG (see next page) |
| 7 rail lines | |
| 8 Brzezinka village | |
| 9 wood furniture assembly | |

One of the 26 heated sleeping barracks:

- 1 chimneys ventilating the coal-fed heaters
- 2 three-story bunk beds
- 3 toilets and wash basins
- 4 office

A solid wall on two sides of the camp:

- 1 top of a 2-story sleeping barrack (14 on p. 48)
- 2 solid cement wall, 3 m (10 ft) high by 8 cm (3 ins.) thick, built by Germans in 1941 to prevent outsiders from seeing the camp, and inmates from looking out (22 on p. 48)

The crematorium and alleged homicidal gas chamber: (see Pressac 1989, pp. 144-147, 151-159; see no. 8 on map p. 48)

- 1 roof vents
- 2 2, later 3 cremation furnaces (2 muffles each)
- 3 morgue, allegedly used as homicidal gas chamber; its features did not permit any homicidal use (Ref.: C. Mattogno, *Auschwitz: Crematorium I*)
- 4 earth covering

Photo 8 – 1943: (below) Workers doing renovations at the kitchen during early 1943. (Ref.: Auschwitz archives, Oswiecim, Poland)

Photo 7 – 1945: (above) old crematorium with alleged gas chamber (Ref.: Pressac 1989, p. 144)

Photo 6 – August 25, 1944: The camp entrance road turned off the Sola River road and passed 3 m (10 ft) in front of the former crematorium and alleged gas chamber. There were no gates on the road from the Sola River bridge to the camp entrance. The crematorium and alleged former gas chamber had two visible dots on its roof, no fence, and no coke storage yard. Outside the camp fence were 9 guard towers. The alleged gallows just below the kitchen are not visible in the photo.

- 1 administration building
- 2 kitchen
- 3 sleeping barracks
- 4 entrance road
- 5 guard towers outside fence
- 6 swimming pool inside fence
- 7 theater
- 8 old crematorium with alleged gas chamber

Chapter 5.3

Alleged Auschwitz I gas chamber – Eyewitness accusations versus what 1944 air photos reveal

Photo 9 – August 25, 1944:

Four summer 1944 air photos reveal the Auschwitz I entrance road passed directly in front of the alleged gas chamber and crematorium which had no chimney, two dots on the roof, no coal storage yard, and therefore does not appear to have been designed as a crematorium.*

Allegations of eyewitnesses:

What 1944 air photos reveal:

The experimental gas chamber was used until the larger Birkenau ones came into use, and it then was converted to a bomb shelter.

The building is small, square, flat-roofed, and in 1944 had no chimney like the Birkenau crematoria.

Fences and gates prevented access from people outside the camp to the building.

The building is outside the Auschwitz I Camp, and the camp entrance road has no gate and passes 3 meters (10 feet) in front of the building.

Hundreds a day walked into the room to be gassed.

The building was visible and accessible by road to villagers outside camp.

Gas pellets were inserted through four roof vents which are there today beside two larger vents.

Only two dots are visible in 1944 photos. The four roof vents must have been added after December 21st, 1944.

Enough coke or wood to burn the bodies was transported to the yard and piled until being used in the crematorium.

The building is not close to a railroad line, and the very small yard has no room for storing coke or wood, so the delivery and storage system would have been very inefficient.

Thousands of bodies were burned each day in the crematorium furnaces.

No fuel delivery system exists such as a coal piling yard beside train tracks, and there is no conveyor.

A ten-meter-high chimney expelled smoke from the crematorium.

In the Dec. 1944 photos no chimney is visible near the building. The current chimney must have been constructed after late 1944.

* This building was used to store ammunition by the Austrian (until 1918) and later the Polish military until WW2; during the German occupation it was briefly restructured and used as a crematorium until the summer of 1943. It was converted to an air raid shelter in late 1944, at which point the chimney and the furnaces were removed. Today's chimney and furnaces are inoperable post-war reconstructions. The four introduction vents in the "gas chamber" roof were added in 1947 by the Auschwitz Museum. See Mattogno, *Auschwitz: Crematorium I*, for details.

Chapter 5.4

Evidence Shows CIA Auschwitz Report Based on Altered Air Photos

“Photographic evidence” of Holocaust alleged in American CIA Report

In 1979 Dino Brugioni and Robert Poirier, two employees of the U.S. Central Intelligence Agency (CIA), released a slender brochure with the title *The Holocaust Revisited*, a report based on the study of newly discovered 1944 aerial photos of the Auschwitz camps. Pictures in the 19 page booklet were widely publicized as photographic evidence of the “Holocaust.”

The two CIA workers had used magnifying and stereo viewing equipment to study air photos from five different dates in 1944, and they concluded the August 25th photos showed clear evidence of “the extermination operations in progress” at Birkenau. Photos were shown of what they interpreted as prisoners being marched to a gas chamber, homicidal gas chambers, special security arrangements around the crematoria, cremation pits, and

vents used to insert Zyklon B pellets into sub-surface gas chambers.

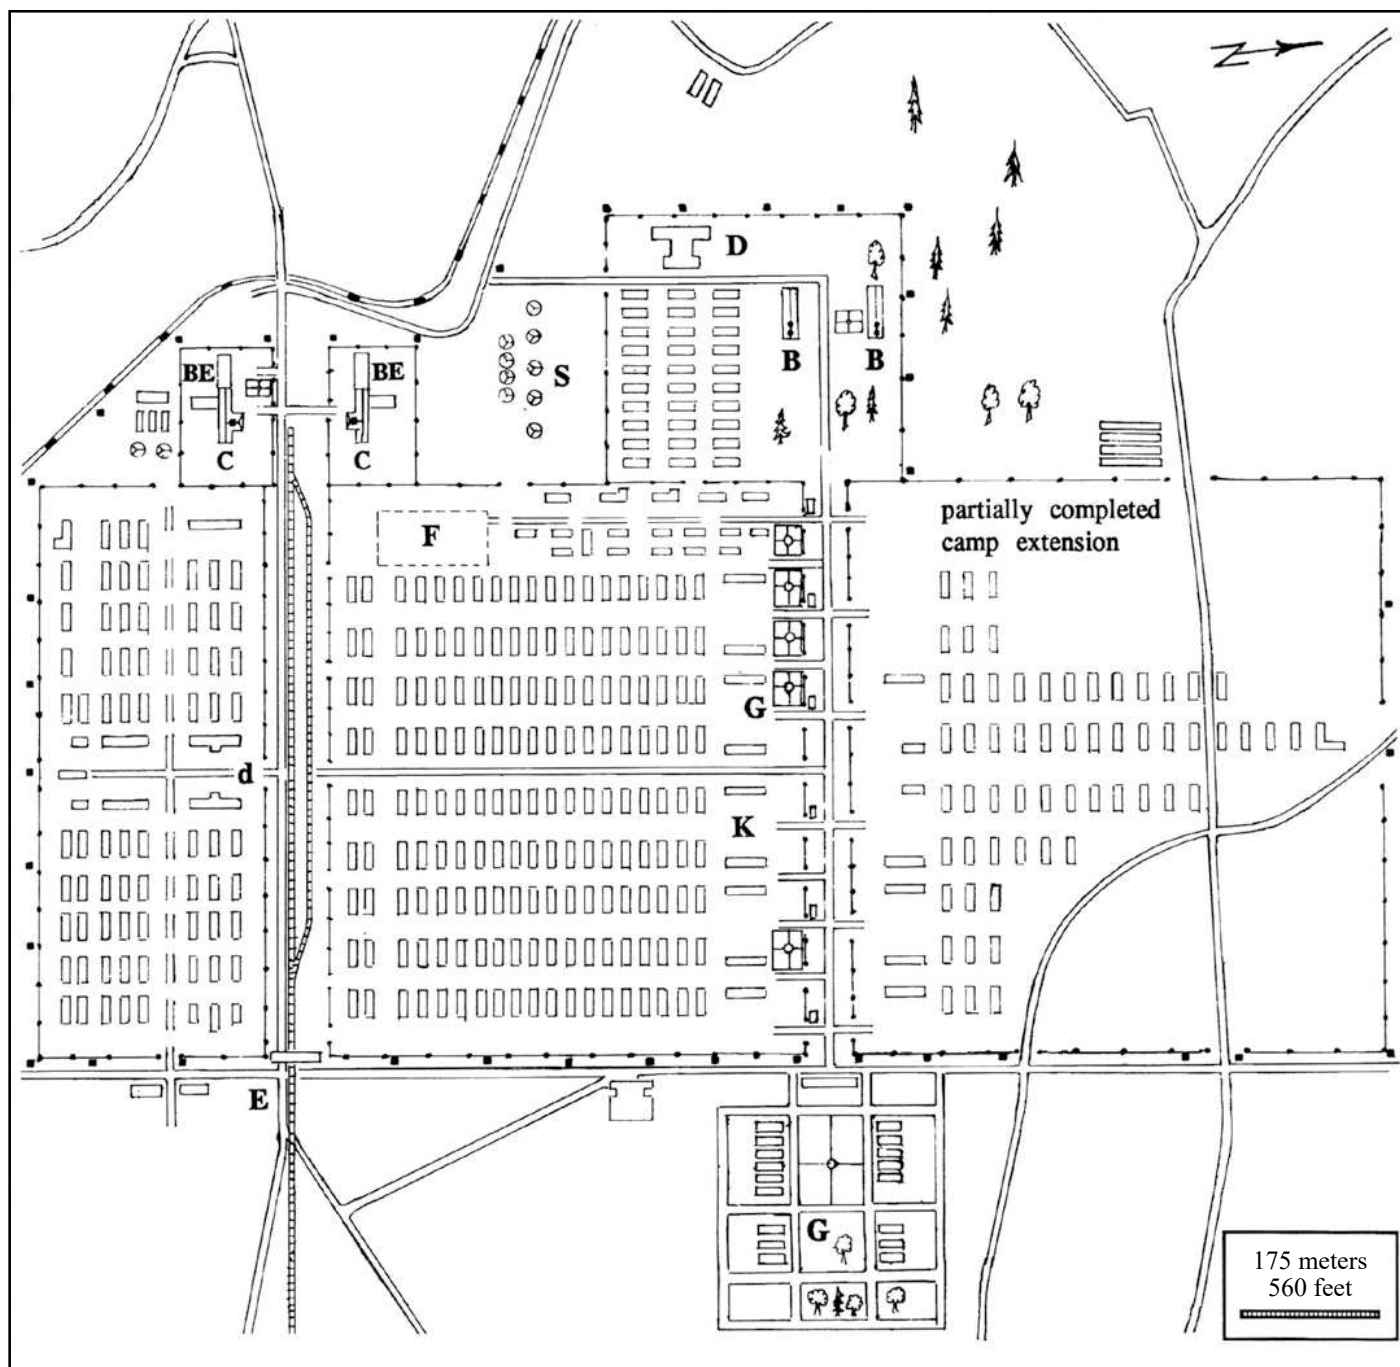

In 1979 the air photo negatives were released from the CIA to the U.S. National Archives in Washington, D.C., for public viewing.

The features adduced by the CIA as evidence for mass murder, do they really show something on the ground, or is there proof that at least some of these features were added to the 1944 air photo negatives by a forger?

Evidence will be presented to show that every mark which the authors of the CIA report used to conclude that homicidal gas chambers were in operation on the August 25th photos was added to the photos after they had been exposed in 1944.

Chapter 5.4

May 31, 1944, photo of the Birkenau Camp (Auschwitz II)

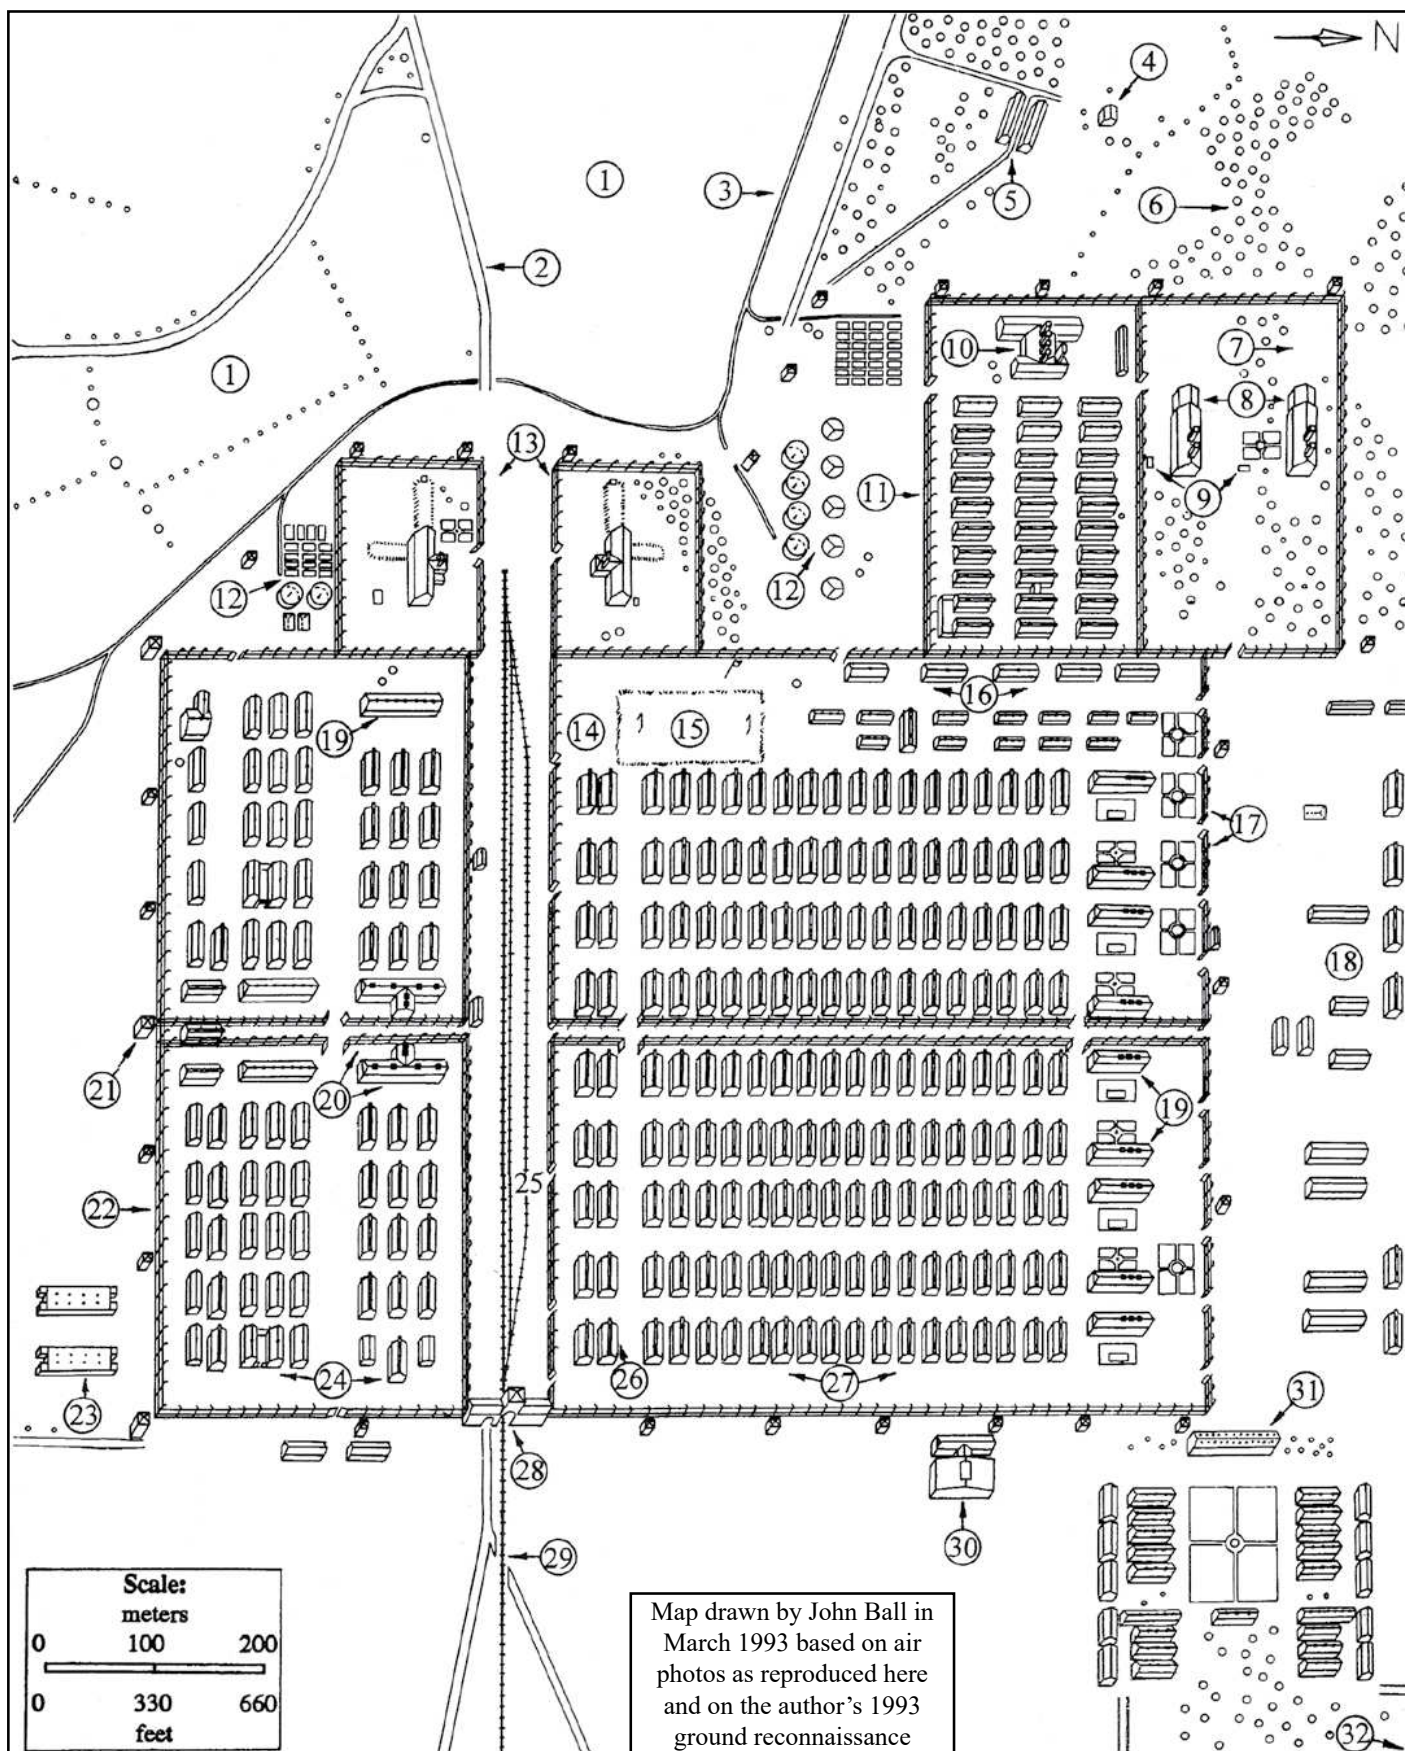

◀ exposed area in Aug. 25, 1944, photos

▶ railroad spur enters camp through main gate

Photo 1 – May 31, 1944: This and other similar photos, as well as ground reconnaissance, were used by John Ball to draw the maps and building sketches on the next four pages. After this follows a photo of August 25th, 1944, exposed by a Mosquito aircraft. It shows only the southern third of Birkenau. Three exposures exist (3184, 3185 and 3186) permitting a 3D-rendering of the scene and thus a thorough analysis. The three photos are relatively clear but are slightly over-exposed. On page 60 Exposure no. 3185 is reproduced.

Chapter 5.4

Schematic map of the Auschwitz-Birkenau Camp (Auschwitz II)

Legend to map on left

- 1 farms that were ploughed and tilled in 1944
- 2 roads entering camp
- 3 drainage ditches that drained to the Vistula River 1.3 kilometers (0.8 mile) west, and Sola River
- 4 the White Cottage/Bunker 2 outside the camp fence, allegedly a homicidal gas chamber in 1942 & 1944
- 5 1942 victims did not use these buildings to undress as alleged; they were not built until June 1944
- 6 trees
- 7 there were no empty pits where it is alleged hundreds of gassing victims a day were incinerated on large pyres from May to Aug 1944, when the crematoria are said to have been overloaded
- 8 Crematoria IV & V said to have contained homicidal gas chambers in their west wings operating in 1943 & 1944 were visible from all sides through wire fences
- 9 ditches six meters (20 ft) long by 1.5 meters (5 ft) deep had water in the bottom
- 10 "Zentralsauna" disinfestation building where steam and hot air killed body lice in clothes, and inmates also showered (Pressac 1989, pp. 65-85)
- 11 the 30 Kanada barracks where inmates worked to sort and store clothing and personal effects that new arrivals had brought to camp
- 12 sewage treatment ditches and round tanks
- 13 Crematoria II & III with below-ground morgues, one of which allegedly was a homicidal gas chambers where half a million victims in batches of 1,000 to 3,000 are said to have been murdered during 1943 & 1944
- 14 location where one of six Auschwitz I and Birkenau orchestras gave Sunday concerts (Kopyclinski, p. 112)
- 15 sports field with soccer goal posts
- 16 hospital buildings for inmates
- 17 gardens
- 18 Mexiko camp extension did not have a fence, however, after 1945 a fence was built
- 19 kitchens – 9 in men's camp, 3 in women's
- 20 sanitation buildings 5a & 5b with inmate showers and delousing chambers where cyanide gas was used to kill typhus-carrying body lice
- 21 guard towers
- 22 wire fence three meters (ten feet) high
- 23 storage buildings for potatoes and vegetables
- 24 women's brick-and-wood sleeping barracks
- 25 train loading and unloading ramp
- 26 row of toilets and wash basins
- 27 men's wooden sleeping barracks
- 28 main entrance gate
- 29 railway tracks
- 30 water pumping station
- 31 camp administration headquarters
- 32 Brzezinka town

Zyklon B cyanide gas disinfestation buildings:

Buildings 5a and 5b (number 20 on map left)

- 1 Air intake stacks for ventilation; there were two extractor fans set into the gable wall.
- 2 Room where Zyklon B (HCN) gas was used to kill typhus carrying body lice in clothes and bedding. In Building 5a this space was split into five in 1943 and converted to use hot air instead of Zyklon B (Pressac 1989, p. 53).

Crematoria IV & V:

(number 8 on map left)

- 1 Furnace room with a single 8-muffle cremation furnace.
- 2 Alleged homicidal gas chambers (in west wing) without any forced ventilation. Ventilation by draft would have endangered all present in the building. Documents show that large water and sanitary installations were built in these buildings, hence they served as sanitation facilities (Mattogno, *The Real Case...*, pp. 158-126).

Men's and women's sleeping barracks:

(number 24 & 27 on map left)

- 1 Bunk beds with mattresses three rows high.
- 2 Brick coal-fed heaters down entire length of barracks.

Chapter 5.4

The Crematoria II and III, where almost half a million victims were allegedly murdered

- | | |
|--|---|
| 1 roads without gates | 14 one-meter (3.3-ft)-high roofs of alleged homicidal gas chambers where SS men were said to have poured Zyklon B cyanide pellets through (absent) roof vents |
| 2 farms that were ploughed and tilled during 1944 | 15 ditches 2 meters (6.5 ft) deep with water in bottom |
| 3 birch and poplar trees | 16 crematoria built to burn a maximum of 300 corpses a day (see p. 87) |
| 4 drawing on top of next page is viewed from this location | 17 sewage settling ditches |
| 5 drawing on bottom of next page is viewed from this location | 18 kitchen in the women's camp |

Chapter 5.4

Marks on August 25th, 1944, photos said to be evidence of “homicidal gassings”...

Chapter 5.4

...are black in contrast to the grey shades in this September photo

Photo 3 – September 13, 1944

September 13, 1944:

The marks on the August 25 photo are suspicious because:

1. They are solid black whereas other buildings and marks are grey and black.
2. In the September 13th photo the scale is too small to allow people to be seen, even standing in large groups, and the August photo is the same scale as September.
3. A large group of people standing close together would almost certainly look grey and black rather than solid black.

Now: In order to conclusively prove the marks were added to the photographs after 1944, we need to locate marks that are not natural features and could only have been drawn on. Three such marks are as follows:

Chapter 5.4

Proof number 1:

**“Prisoner groups standing in formation”
are marks covering ground areas but also building roof areas**

Photo 4 – Aug. 25, 1944: Nine marks near a building that are solid black and have no grey tones or shadows occur about a third of the way up the photo at the right edge. Also part of two marks overlap the roof.

Photo 5 – Aug. 25, 1944: Two of the marks occur on the ground and also overlap onto the building roof. Since groups of people could not overlap onto the roof, this is the first *unquestionable proof* the photos were retouched. Lucas’s claim that the dark spots on the roof are “repair stains” is hilarious (Zimmerman, Appendix IV). They happen to coincide in location, shape, color etc. with the “inmate group,” and that group actually walks underneath that roof – through the walls. Sure.

Photo 6 – Sept. 13, 1944: The size of the building is evident in this September photo. (Scale: 1 centimeter = 12 meters)

Chapter 5.4

Proof number 2:

“Prisoners marching” is a zig-zag line that looks like a sewing stitch

Photo 7 – Aug. 25, 1944: (left)

Exposure 3186. The vertical zig-zag line on the road in the center of the photo has been very carefully drawn on two consecutive photos in a slightly different location to make it appear as if a group of people were moving along a main road in the camp. The consecutive photos below, numbers 3185 and 3186, were exposed 3.5 seconds apart.

Photo 8 – August 25, 1944, Exposure 3185

These are section enlargements of Photo 7. It is claimed that these are inmates walking. However, they clearly form a zigzag line, which is not likely to be formed by people marching. Shermer/Grobman (p. 147) have posited that this is a “moiré effect” produced by the alleged fact that the size of the inmates’ heads roughly matches that of the silver grains in the film. A “moiré effect” is produced when two repetitive patterns of a similar order of magnitude interfere with each other optically. Such patterns are

Photo 9 – Aug. 25, 1944, Exposure 3186

common today in the age of digital scanners and photography, because their sensors are arranged in a highly symmetrical, repetitive pattern. Photographic emulsions in chemical films, however, have a random distribution of silver grains and therefore by definition cannot produce a moiré effect. In addition, the heads of people walking in a line don’t form a highly regular pattern either. Hence, it is more likely that this line was drawn by a hand guiding a marker in a zigzag pattern.

Chapter 5.4

Proof number 3:

Marks were added to the roofs of Morgues #1 of Crematoria II (left) and III (right)

Several, but not all, of the air photos showing the Crematoria 1 and 2 of Birkenau have four dark marks on the roofs of Morgues no. 1 of Crematoria II and III. Brugioni and Poirier claimed in 1979 that these were the vents through which Zyklon B was inserted into the room below, the alleged homicidal gas chamber. Below is reproduced a section enlargement of the photo taken on August 25, 1944. On the next page this issue is discussed in more detail.

Photo 12 – August 25, 1944

Photo 13 – August 25, 1944

The thick line looking like a wide hedge or a wall may have been drawn on, as it casts no discernible shadows. Furthermore, the single wide line looking like an open gate is suspicious because ground pictures of the wire-and-steel gates in front of the crematoria, such as the one on the right, show two separate thin gates, which would not show up on air photos, instead of a single thick one. The May and June photos moreover do not show any lines. Documents show, however, that a “green belt” around the Birkenau crematoria was planned by the Auschwitz authorities to prevent gawkers from seeing the buildings. These additional optical barriers, apparently some type of wicker fences, were put in place step by step starting in May 1944. See the subchapter starting on p. 70.

After 1945 (date unknown): Two brick columns with narrow steel-and-wire gates in front of Crematorium III. (Ref.: Pressac 1989, p. 366).

Chapter 5.4

The four dark marks on the roofs of Morgues no. 1 of Crematoria 1 and 2 were drawn on because:

1. They are not shadows, as they go in various directions and most importantly in a different direction than real shadows (like the chimney's, see photo with explanations below).
2. Using stereo magnifying equipment, they have no measurable height.
3. Witnesses have claimed that the vents were not bigger than some 0.7 m × 0.7 m. The marks, however, are some 3 to 4 meters long and roughly a meter wide. In addition, their shape is too irregular.
4. The roof of Morgue #1 of Crematorium 1 collapsed in late 1944/early 1945 after it was dynamited, but the broken-up concrete slabs are still there today. A thorough investigation of these ruins has demonstrated that there haven't been any openings in that roof resembling either the marks visible on any of the air photos or what witnesses have claimed (Rudolf/Mattogno, pp. 291-407).

Illustration 1: based on Photo 2. We can tell immediately that the marks on the roofs of Morgues #1 of both Crematorium II and II – the alleged gas chambers – cannot be insertion vents for Zyklon B as claimed: they are too long, too irregular, and for being shadows, they go in the wrong direction.

To “explain” these strange marks, some have claimed that they are discolorations on the roofs due to SS men walking from one vent to another while pouring in Zyklon B (Keren *et al.*, p. 72). However, a walking path would be an uninterrupted line starting at the roof's edge and then going straight from one vent to another and finally getting off the roof. The actual pattern we see, though, would require the SS men to jump some 5 meters onto the roof to get to the first mark, then again from one mark to the next, and finally off the roof. See Illustration 2 on the right.

Illustration 2: based on Photo 2. If these are walking paths of SS men, then they must have walked in a slanted line, then jumped a few meters along the dotted line to the next mark.

Chapter 5.4

Proof number 4:

Auschwitz I photos also marked with zig-zag line that looks like a sewing stitch

Photo 10 – Aug. 25, 1944:

This Auschwitz I photo has the same type of sewing-stitch mark as photo Exposure 3186, indicating it was probably the same individual who marked both photos. Black marks occur in two other areas on the photo that are too solid in tone to be vehicles or people, and they do not have shadows.

Photo 11 – Aug. 25, 1944: (enlarged section of Photo 10)

The mark described in the CIA report as a “a line of prisoners for registration.” There is no natural explanation for this mark other than it was drawn on after the photo had been exposed.

Scale: 1 cm = 16 meters –1 inch = 110 feet

Chapter 5.4

**Compiling all the evidence together allows us to conclude that
66 marks were added to the August 25th, 1944 Birkenau air photos**

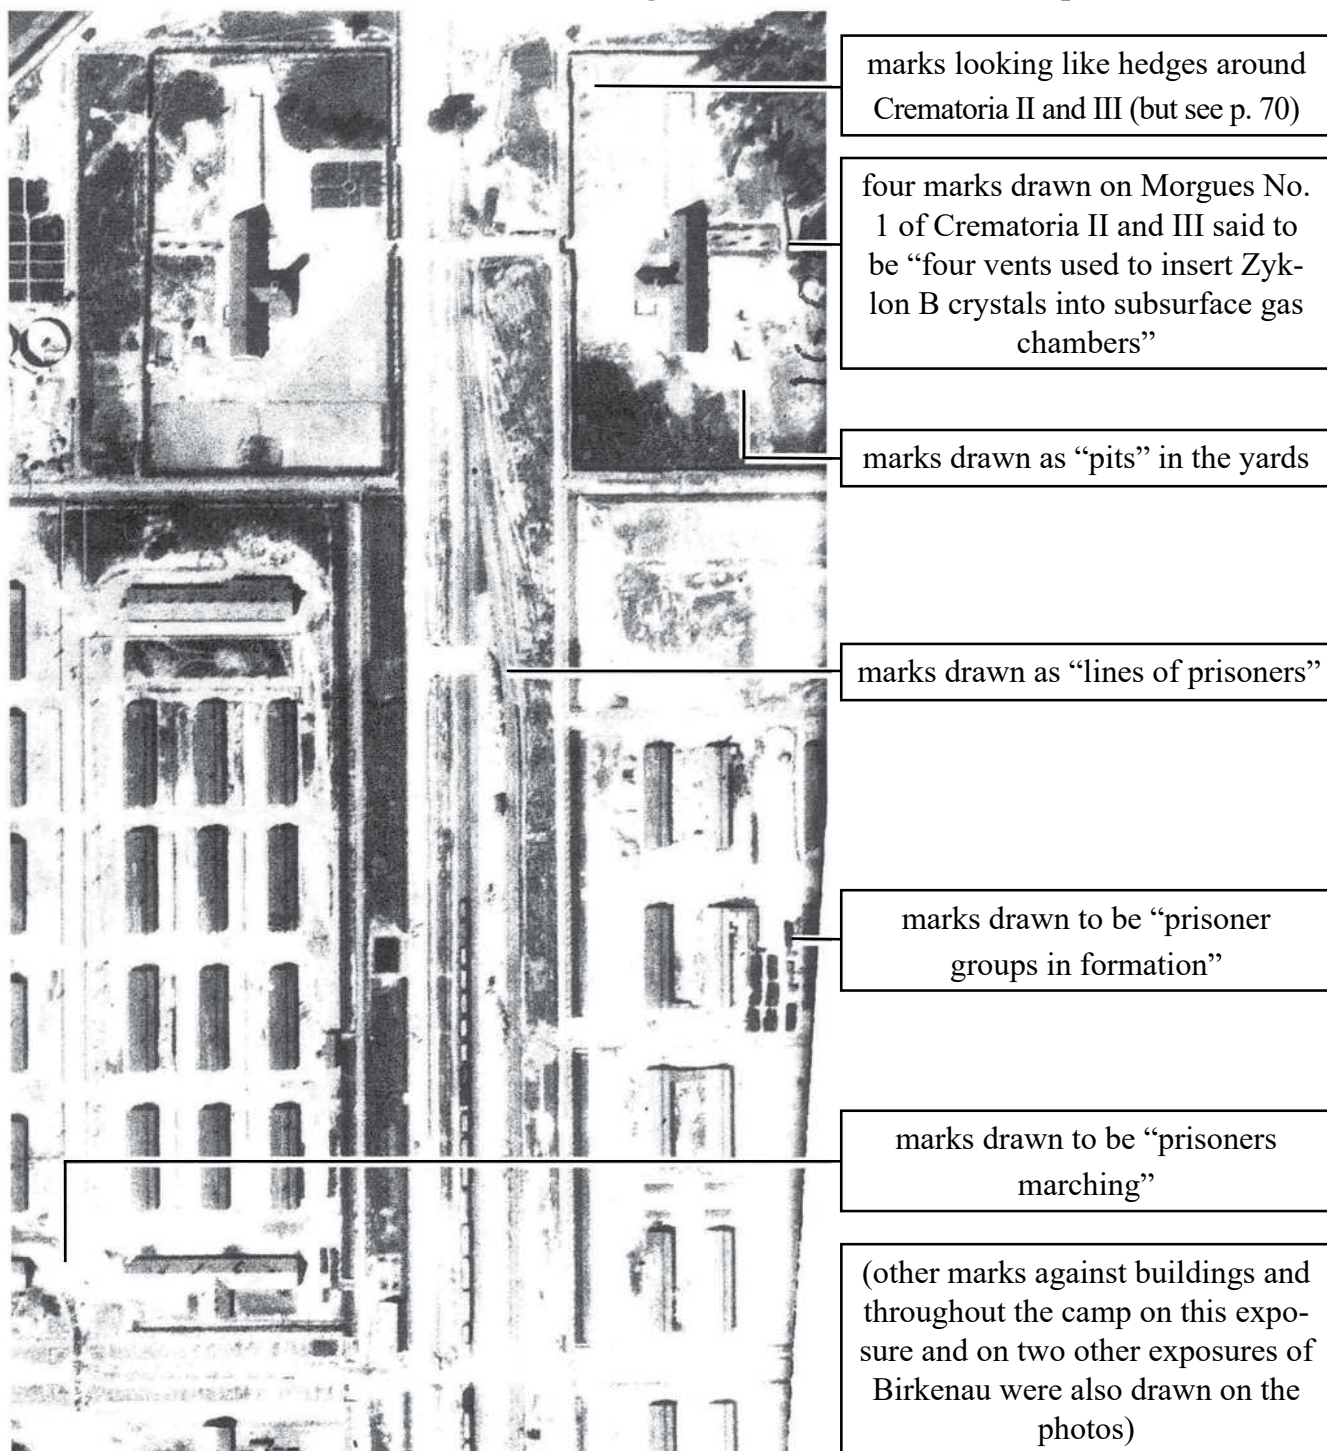

Photo 14 – August 25, 1944

Total marks added to photo numbers:	– added to Exposure 3184	= 8 marks
	– added to Exposure 3185 (this photo)	= 40 marks
	– added to Exposure 3186	= 18 marks
	Total added to 3 Exposures	= 66 marks

Conclusions for Chapter 5.4

From five exposure numbers 3182 to 3186, (Record Group 373, Can 5367):

1. There is overwhelming evidence *one mark* was put on *each of three exposures* – Numbers 3183 of *Auschwitz I*, 3185 of *Birkenau*, and 3186 of *Birkenau*.
2. There is enough evidence to conclude:
 - (a) 66 marks were added to Exposures 3184, 3185 and 3186 of *Birkenau*,
 - (b) 10 marks were added to Exposures 3182 and 3183 of *Auschwitz I*, and therefore
 - (c) a total of 76 marks were added to the five air photo negatives after 1944.
3. Included are *all* of the marks shown and described as “*the extermination operations in progress*” in the 1979 Central Intelligence Agency report *The Holocaust Revisited*.
4. Evidence reveals the following about how the photos were marked:
 - (a) The marks were most likely drawn on paper enlargements of the original negatives using magnifying equipment and fine-tipped markers, and these paper prints were photographed and the negatives were *reinserted* in the original air-photo-negative rolls.
 - (b) On consecutive photos, marks were drawn almost exactly alike but in the case of “moving inmates” at slightly different locations to make it appear as if the marks were moving. This would only have been done by experienced air photo viewers.
 - (c) In 1979 the *Central Intelligence Agency* gave copies of the negative rolls instead of the originals to the *National Archives* for public viewing.

I was told by government representatives in Washington, D.C., that the only people who had access to the air photos before they were released to the public in 1979 were employees of the Central Intelligence Agency.

As shown on the next page, the May and September Birkenau photos were also marked:

- May 31st: Dots have been drawn on the roofs of Morgues no. 1, and short fence marks may have been drawn around Crematorium II, but nothing has been drawn around Crematorium III.
- Sept. 13th: Fence marks appear around both crematoria, but there are no dots on Crematorium II.

Therefore in 1944:

**the fences might have looked similar to the way they appear in the May 31st photos,
and
the roofs of the Morgues no. 1 looked similar to the way they appear on that of Crematorium II
in the Sept. 13th photos.**

Chapter 5.4 addition: Evidence the May and September photos have also been altered

May photos: dots on alleged gas chambers have been drawn on.
Sept. photos: only some dots have been drawn on, while hedges/walls run all around.

Chapter 5.4.1

The Fences around the Birkenau Crematoria

By Carlo Mattogno

The issue of fences around the Birkenau Crematoria is quite controversial. In this regard there are several, apparently conflicting, documents, so it is difficult to come to a conclusion.

On October 21, 1943, SS-*Obersturmführer* Werner Jothann, Head of the Central Construction Office, who had assumed this position three weeks earlier from SS-*Sturmbannführer* Karl Bischoff (who in turn had been promoted to Head of the Construction Inspectorate of the Waffen-SS and Police “Schlesien”), drew up a “memo” with the subject “Create green belts around Crematoria I and II,” which stated:¹

“Referring to an earlier conversation with SS Stubaf. Bischoff, the commander, SS Ostuf. Höss, asks to draw up a sketch on planting a green belt around the Crematoria I and II of the PoW camp with the request to draw this sketch and implement the measure without delay. With this a natural seclusion from the camp is to be achieved. It is proposed to plant firs and spruces to ensure that seclusion also for the winter months. A clearance of at least 5 m must remain between the existing wire fence and the green belt.”

On November 6 Jothann turned to the head of the agricultural operations, SS-*Sturmbannführer* Joachim Cäsar, with a letter concerning “Release of plant material to create a green belt for the Crematoria I and II of the PoW camp.” In it he referred to an order by Höss according to which “the

Illustration 1: Richard Baer (left) shakes hands with Karl Bischoff (right) on occasion of the inauguration of the SS hospital at Auschwitz-Monowitz in September 1944. (Ref.: U.S. Holocaust Memorial Museum; www.ushmm.org/m/img/34803-700x.jpg)

¹ Rossiiskii Gosudarstvennii Vojennii Archiv (Russian State Archive of War; hereinafter abbreviated as RGVA), 502-1-312, p. 21

Crematoria I and II of the PoW camp are to be equipped with a green belt as a natural seclusion from the camp” and asked him to procure the plants “from forest stands”:²

“200 pieces deciduous trees 3-5 m high
100 “ young deciduous trees 1½ – 4 m high
300 “ spruces and pine trees 1½ – 4 m high
and 1000 “ various hedge shrubs 1 – 2½ m high.”

The measure was a consequence of an order issued on June 15, 1943, by SS-Obersturmbannführer Arthur Liebehenschel of Office Group D of the SS-WVHA and was addressed to the commanders of the camps of Sachsenhausen, Dachau, Neuengamme and Auschwitz. It stated

*“that, when constructing further special facilities, attention has to be paid to the fact that they are located in seclusion according to their specific function and cannot be ogled by all sorts of people.”*³

On November 25, SS-Unterscharführer Dietrich Kamann sent a letter to the Central Construction Office, which was in charge of “gardening.” It had the subject “Creation of green belt around Crematoria I and II in the PoW camp.” He declared in it that the work had not yet begun, because the agricultural department had not yet authorized the delivery of any plants.

Apparently the project was temporarily abandoned and resumed only a few months later.

On May 16, 1944, Jothann sent a letter to the Construction Inspectorate of the Waffen-SS and Police “Schlesien” which dealt with “Crematorium facilities in the Auschwitz Camp, security measures” and as a reference a “telegram of the Head of Office Group C of Dec. 05, 44.”

In this letter Jothann enclosed “a list of iron and cement requirements for concrete posts around the crematoria in Camp II,” with the request to forward it to the Head of Office Group C SS-WVHA, SS-Brigadeführer Hans Kammler.⁴

The attached document is titled “Establishing procurement authorization for the construction of a wire mesh fence between iron posts around the crematoria in the Auschwitz concentration camp” and lists a sizeable need for iron (*Eisenbedarf*) and cement (*Zementbedarf*) for its implementation: 31,500 kg and 24,761 kg, respectively.⁵ A map (see Map 1) shows the work to be performed.⁶

On May 17, Bischoff replied.⁷

Map 1: Fences (arrows) planned in May 1944 to be built around the Birkenau crematoria

“For the safety measures (camouflage) of the crematoria at Auschwitz, the necessary documents for the allocation and the application for construction material are to be prepared immediately and to be submitted here.”

On June 26 Jothann sent another letter to the Construction Inspectorate “Schlesien” with the subject “Special allocation of iron quota for fencing in the crematoria in the PoW camp,” confirming the receipt of “procurement authorization for iron in the amount of 20,000 kg.”⁸

On September 5 Jothann wrote as follows “to the Construction Office of Concentration Camp II, Birkenau”:⁹

“The local Construction Office has submitted to us the allocation documents relating to camouflaging the crema. in the PoW camp, but only for the installation of wooden posts with shrubbery. Originally reinforced concrete pillars with barbed wire were installed instead of the wooden posts currently in place. The local head of the protective custody camp had the pillars removed and passed them to the recycling workshop.

I ask the Construction Office to determine, how much concrete pillars have been sent there and to notify me here about it.

The allocation documents are enclosed.”

The last document in my possession about this topic is a letter by Bischoff of September 23, 1944. It refers to “Construction application for installing fences for security measure (camouflage) of the Cremas in the Auschwitz concentration camp, Camp II.” It contains the “Construction order no. 91”:¹⁰

⁸ RGVA, 502-1-317, p. 239.

⁹ RGVA, 502-1-317, p. 13.

¹⁰ RGVA, 502-1-67, p. 227.

Map 2: Fences planned and in existence at the Birkenau Camp in February 1944

“Based on the submitted documents, I hereby issue the order to install fences for security measures (camouflage) of the crematoria [sic] in the Auschwitz concentration camp II.”

A “Staking-out sketch of watchtowers around the PoW camp,” plan no. 3512 of February 7, 1944 (see Map 2), shows all the fences of the camp, including those around the crematoria (the solid line indicates “existing fence,” the dotted “planned fence”).

It also mentions the garrison order no. 18/44 of June 27, 1944, in paragraph 13, “wire obstacles around Crematoria III and IV,” stating:¹¹

“The wire barrier around Crematoria III and IV will be charged with electric current starting Monday, June 26, 1944, 16.00 o’clock. All SS members and relatives are to be informed about this immediately.”

I may point out that even air photos taken on December 21, 1944, and February 19, 1945, show marks looking like thick fences around the ruins of Crematoria 1 and 2 (see p. 92 of the present study), just like the air photos of 31 May, 25 August, and 13 September 1944.

It is certain that a wire fence supported by concrete columns existed around the crematoria. It also seems certain that in early September 1944 a fence made of wooden posts was in place (“the wooden posts currently in place”; “wooden posts with shrubbery”), probably a few meters behind the barbed wire fence. This is also suggested by a 1945 photograph showing a fence like this (see Illustration 3). The caption reads: “Birkenau. Part of the wicker fencing masking the crematory.”¹²

¹¹ Archiwum Państwowego Muzeum w Oświęcimiu (Archive of the State Museum Auschwitz), D-AuI-1/61, nr. inw. 4591, p. 343.

¹² Bogusławska-Swiebocka/Ceglowska, p. 168.

A fence of this type around Crematorium 1 and 2 existed therefore probably already on August 25, 1944. As for May 31, it could be argued that the work had already begun around Crematorium 1. If one hypothesizes that the original negatives of that day were tampered with, one could assume that those who added marks “looking like fences” onto those aerial photographs were inspired by the actual fences showing up on later air photos like those of August 25 and September 13.

The photograph reproduced as Photo 2(a) on p. 89 of the present study (taken from Klarsfeld’s *Auschwitz Album*) shows in the foreground a group of deportees. In the background, behind the barbed wire fence, one can see the chimney wing (left) and the furnace room (right) of Crematorium 2. I reproduce here another photograph for that *Album* (Illustration 4). This group of deportees has moved about 20 meters to the west. In the background appears the fence surrounding Crematorium 2, and behind it the soil embankment of the semi-underground Morgue #2; to the right the entrance gate is visible, with one wing closed and the other opened (arrow). The gate is identical to the one shown on p. 64 of this study, which was taken after the war. Illustration 4 shows that at the end of May 1944, when this photo was taken, Crematorium 2 had not yet any fence made of wooden posts with tree branches.

Illustration 3: “Birkenau. Part of the wicker fencing masking the crematory.”

Illustration 4: Deportees at Birkenau in May 1944, walking westward, passing by Crematorium 2.

Chapter 5.5

Farms Surrounding Birkenau

Photo 1 – September 13, 1944: (For now please discount the bombs falling directly over the camp.) From the surrounding flat farmland, nine roads enter the Birkenau Camp. There are no visible gatehouses, gates, or guardhouses on any of the many roads surrounding the camp. In the upper right corner across the Vistula River is the large village of Jedlina. German authorities had expelled local farmers from their farmsteads around the Birkenau Camp. In 1944, these farms were operated by the SS using mainly inmates housed in smaller camps in the area. But the area was not cordoned off for anyone, as we will see.

Chapter 5.5

Roads offer open access to Birkenau from the Vistula River

Photo 2 – Sept. 13, 1944: At this corner of Birkenau the two roads from the Vistula River both have access to the camp. Buildings that appear to be farmhouses – operated by the SS at this point in time – occur along the roads, however, there are no visible guardhouses or gatehouses.

Chapter 5.5

A clear view across farms from the roads to the crematoria

Photo 3 – August 25, 1944: The line of sight 260 meters (850 feet) from the road at the top left to Crematorium II passed over: (1) a small ditch alongside the road, (2) the field with the parallel dots indicating a harvested grain crop, (3) a single row of trees, (4) the ditch around the camp, (5) the line surrounding Crematorium II which looks like a fence or hedge, and finally (6) Crematorium II with the alleged gas chamber.

Chapter 5.5

This May 31, 1944, photo of farm fields close to Birkenau compares with...

Photo 4 – May 31, 1944: Lines caused by recent disturbance of the topsoil occur on most of the farming plots. The difference between this and the August photo will tell us if the farms were actively worked in 1944.

Chapter 5.5

... this August 25, 1944, photo to show which fields were worked.

vehicles on road

Photo 5 – August 25, 1944: Almost all of the fields in the photo appear to have changed in texture or shade. The three plots with the lines of dots next to the camp appear to all be the same crop. At least 3 vehicles are on the roads in the upper right corner of the photo.

Chapter 5.6: Birkenau Camp

Air Photos Show What People Arriving by Train in 1944 Experienced

Photo 1 – Spring or summer 1944: (above) Looking east from the unloading ramp towards the entrance gate in left background (see arrow). (Ref.: Klarsfeld, S., *The Auschwitz Album*).

Photo 2 – Taken by Soviets, 1945: (below) From on top of the entrance gate looking west along the unloading ramp.

Chapter 5.6

Photo 3 – 1944: (above) Walking west on the unloading amp and road that will pass between Crematoria II and III with their high chimneys visible at the top of the photo (see arrows). (Ref.: Klarsfeld, *Auschwitz Album*.)

Photo 4 – 1945: (below) From the entrance gate looking north along the rows of barracks, the ditch inside the fence, the fence and guard towers, and the road outside. (Ref.: Central ... Poland, page 14.)

Chapter 5.6

What newly arrived Birkenau inmates experienced during 1944

Photo 5 – May 31, 1944:

Ground photographs from the spring and summer of 1944 show that many if not most of the new arrivals walked west on the unloading ramp and took the path of the above dotted line. They then passed each of the areas listed on the right which correspond to headings on the next three pages. Other new arrivals may have walked in other directions to other facilities, however, we can understand what many of the new arrivals saw, heard, and smelled by retracing the above path.

Headings on pages 82 to 85:

- 1 the sports field (soccer)
- 2 the Crematoria II & III
- 3 the sewage treatment tanks
- 4 the disinfestation center (“Zentralsauna”)
- 5 Crematorium III (and V farther north)
- 6 the kitchens
- 7 barracks and gardens

1. The sports field (soccer):

Photo 6 – May 31, 1944: (left) Walking west on the ramp the sports field would be visible across the two-meter (6-ft)-wide ditch. The field was 110 meters (360 feet) long and 40 meters (130 feet) wide and was inside the camp fence. People on the field would have had an unobstructed view of Crematorium III only 100 meters away across what appears to be low vegetation such as garden shrubs.

sports field

2. Crematoria II and III:

Photo 7 – May 31, 1944: Crematorium II (on left) and especially Crematorium III (on right) completely visible at least until May 1944 (when a wicker fence may have been installed) as the people turned right at the top of the walkway. Anyone walking by here would have seen and heard the alleged victims being marched into the crematoria.

Photo 7 (a) – January 1943:

The one-meter-high structure extending from the south side of Crematorium II and covered by a thin layer of snow is this building's alleged homicidal gas chamber. It has no visible Zyklon B insertion vents or other protrusions (see pp. 60, 64f. & 69). Plans show it was designed as a morgue. (Ref.: Pressac 1989, p. 335.)

Chapter 5.6

3. Sewage treatment tanks:
Photo 8 – Sept 13, 1944:
(above) Sewage in these nine 20-meter-wide tanks was stirred to mix it with air in order to breakdown feces before it was released to a ditch and the Sola River. · The smell from these sewage tanks must have been foul.

4. Disinfestation:

Photo 9 – Sept. 13, 1944: (right)
The top of this photo is covered by tape. Also called the “Zentralsauna,” this is where prisoners received a haircut, shower, and new clothes.

5. Buildings with visual shield:

Photo 11 – May 31, 1944: (left) The path leads past Crematoria IV & V with no visual shields (at least until early summer 1944) on the way to the barracks. The buildings were in full view, and any unnatural sights or sounds would have been immediately evident to these new arrivals.

40 meters
130 feet

Chapter 5.6

6. Kitchens:

Photo 12 – Sept. 13, 1944:
(left) In Birkenau there were 12 of these kitchen buildings measuring 60 meters (200 feet) long and 12 meters (40 feet) wide. In this photo there are two smaller gardens and a pool – probably a fire pond – that appears to be full of water (it shows as a black rectangle) beside the two larger symmetrical gardens.

Photo 13 – 1943 or 1944:
(right) The kitchens and gardens

7. Gardens:

Photo 14 – Sept. 13, 1944: (left) 18 large houses which could have been barracks or green-houses were beside disturbed plots of soil which may have been gardens of some type. These are alleged to have been the SS guards' lodging barracks.

Chapter 5.7

The 1944 War Refugee Board Report...

The U.S. War Refugee Board was created in January 1944 to monitor the refugee situation in Europe. Below are excerpts from a letter sent by a Board employee in Switzerland to the Secretary of State describing alleged exterminations at Birkenau.

Item: Urgent confidential telegram

To: C. Hull, Secretary of State, U.S.A.

From: R. McClelland, War Refugee Board Employee, Switzerland.

Date transmitted: July 6th, 1944

Date received: July 8th, 1944

Two eye witness reports recently reached Switzerland concerning Nazi... extermination camps of Auschwitz and Birkenau... These are based on experiences of two Slovakian Jews... who escaped in April 1944. They corroborate... information received... in Switzerland during past two years particularly dates and composition of transports which arrived in Auschwitz and Birkenau from all over Europe...

Each camp is encircled by outer chain 50 to 60 watchtowers at radius of two kilometers (1 1/4 miles)... Northeast [correct: west] end of Birkenau camp is distinguished by high smokestacks of four crematoria...

At end of February 1943 four newly constructed crematoria and gassing units were put into operation in Birkenau. The two larger ones consisted of a vast central hall flanked on one side by furnace room and on other by long narrow gas chamber. The central hall is camouflaged to represent bathing establishment. Made to undress

given piece of soap and towel and herded down a short stairway into adjoining lower gas chamber this is hermetically closed and SS men wearing gas masks mount to roof and shake down into room from three openings in ceiling a powdered cyanide preparation labelled cyklon manufactured in Hamburg.

Within a few minutes everyone is dead, latter is aired and Sonderkommando proceeds with gruesome work of transporting bodies on small flat cars running along track to furnace room here there are nine ovens each with four openings with high smokestack rising in middle each opening can incinerate three normal bodies within one onehalf hours. Daily capacity of larger crematoria is 2,000 [each,] of two smaller about 1,000 each, total for all four units is some 6,000 daily...

Authors set number of Jews gassed and burned in Birkenau between April 1942 and April 1944 at from 1.5 to 1.75 million...

It should be recalled... two similar extermination camps in Poland were functioning a few months ago Malkini Treblinka [spelled as in original telegram] near Bialostok and Belzec near Bug.

In seeking to investigate these statements of 1944, air-photo interpreters would have looked for:

1. An "... outer ring of 50 to 60 watchtowers at radius of two kilometers" – but they would have found that a string of watchtowers were located just outside the camp fence, yet outside of this there were open roads, farms, and villages, with no gates, guardposts, or watchtowers.
2. The "... high smokestacks of four crematoria" and determined the locations of the buildings.
3. In attempting to confirm that the "... Daily capacity of the large crematoria is 2,000..." etc., they could have either referred to books or records to estimate the maximum number of bodies that crematoria of this design and size would burn in 24 hours, or they could have contacted a cremation expert.*

*The first edition of this work referred here to F.A. Leuchter's 1988 expert report on Auschwitz and Majdanek; see also the updated edition by Leuchter/Faurisson/Rudolf. We rely here on more recent research findings.

Chapter 5.7

...in the Light of Subsequent Research Results

Since 1988, Italian Engineer Dr. Franco Deana and Italian Historian Carlo Mattogno have analyzed thousands of German wartime documents from Auschwitz and other camps describing in minute detail the cremation facilities built there. Then they compared them with technical data available for similar cremation facilities in pertinent expert literature. Based on this, they calculated the following capacities for the crematoria in Auschwitz:*

Claim: *“The two larger [crematoria] consisted of a vast central hall flanked on one side by furnace room and on other by long narrow gas chamber.”*

Fact: These crematoria had no vast central hall. They consisted mainly of one ground-level furnace room and two below-ground morgues.

Claim: *“The central hall is camouflaged to represent bathing establishment.”*

Fact: There was no central hall.

Claim: *“small flat cars running along track [from gas chamber] to furnace room”*

Fact: The morgues were connected to the furnace room only by one small elevator.

Claim: *“there are nine ovens each with four openings”* = 36 muffles × 2 crematoria

Fact: Each of these crematoria had five furnace units. Each unit was fired by two coke hearths and had three muffles (incineration openings) = 15 muffles × 2 crematoria.

Claim: *“with high smokestack rising in middle”*

Fact: The chimney was housed in a side wing of the building.

Claim: *“each opening can incinerate three normal bodies within one onehalf hours.”*

Fact: The muffles were smaller than normal civilian cremation muffles, which are designed for just *one* corpse, because the Auschwitz muffles were designed for *one* corpse *without* coffin. Three

corpses could not fit through the muffle door. The cremation of one corpse in a coke-fired furnace takes one hour at least.

Claim: *“Daily capacity of larger crematoria is 2,000 [each]”* $[36 \times 3 \text{ corpses/load} \times 24 \text{ h/day} \div 1.5 \text{ h/load} = 1,728 \text{ corpses/day}]$

Fact: The theoretical maximum daily capacity of these crematoria during 20 h/day operation (allowing 4 h for required daily cleaning of hearths = burn out, clean, fire back up): $15 \times 1 \text{ corpse/load} \times 20 \text{ h/day} \div 1 \text{ h/load} = 300 \text{ corpses/day}$

Claim: [Daily capacity] *“of two smaller [crematoria] about 1,000 each”*

Fact: The theoretical maximum daily capacity of the smaller crematoria was 180 corpses daily during round-the-clock operation.

Claim: *“number of Jews gassed and burned in Birkenau between April 1942 and April 1944 at from 1.5 to 1.75 million”*

Fact: Considering the furnaces’ documented downtime due to maintenance and repairs, the documented, very limited coke deliveries, as well as the limited service life of the fireproof lining of furnaces and flues, which was never replaced, the crematoria in Auschwitz cannot have incinerated more than some 138,000 corpses. This number is similar to the estimated total death toll of the Auschwitz camps due to “natural” (*i.e.* non-homicidal) deaths.

We can now interpret this information the same way 1944 air-photo interpreters used photo images combined with research material to arrive at conclusions:

1. Using the witness report figure of 36 individual muffles in each of the larger crematoria – an unlikely amount for this size of building – then a theoretical maximum of some 700 corpses could have been cremated in 24 hours, which isn’t even a third of the witness report’s 2,000 corpses in 24 hours, and
2. all four crematoria appeared to have been almost completely visible from both inside and outside the camp.

*For the layout of those crematoria see Pressac 1989, pp. 183-378; for the capacities see Mattogno/Deana..

Chapter 5.8

Crematoria II & III at Birkenau – Eyewitness Accusations

Allegations of eyewitnesses:

The crematoria end of the camp was surrounded by a special security system.

The crematoria were surrounded by high fences.

Thousands a day walked into underground rooms to be executed.

Gas pellets were inserted through four roof vents to kill the people.

Enough coke or wood to burn the bodies was transported to the yard and piled up.

Thousands of bodies were burned each day in the crematoria furnaces.

Smoke rose out of the crematoria chimneys.

In the summer of 1944, bodies were constantly burning on pyres in large pits behind some of the crematoria.

Photo 1 – May 31, 1944
(above)

After viewing air photos on the next pages, these accusations will be answered.

Photo 2 (a) – 1944: Looking north from the road towards Crematorium III in the background. (Ref.: Klarsfeld, S., *Auschwitz Album*)

Photo 2 (b) – 1944: Looking west from the train unloading ramp towards the high chimney of Crematorium II in the background. (Ref.: Klarsfeld, S., *Auschwitz Album*)

Chapter 5.8

Eight dates in 1944 reveal no smoke from crematorium chimneys ...

Photo 3 – Dec. 27, 1943:

Haze covers the photo making it impossible to determine if smoke is rising from the chimneys or the yards.

Photo 4 – May 31, 1944:

no hedges

no smoke

no piles of coke or wood

no smoke from alleged burning pits*

Photo 5 – June 26, 1944:

no smoke

no piles of coal or wood

no smoke from alleged burning pits*

90 * The orthodox narrative does not claim that corpses were burned in open pits near Crematoria II and III, although some witnesses have claimed burning pits in that area, Elie Wiesel in his book *Night* among them. See Routledge, pp. 106-124.

Chapter 5.8

... or pits on the ground, and no coal or wood piles or delivery system

Photo 6 – Aug. 25, 1944:

no smoke

no burning pits

no delivery system
for coke or wood

Photo 7 – Sept. 13, 1944:

There are no dots on
the roof of Morgue
no. 1 of Cremato-
rium II.

no smoke

Photos taken on
other dates show no
smoke either (July
8, Aug. 20, Aug. 23,
1944; see Bartec)

Photo 8 – Sept. 13, 1944:

As in Photo 7, there
are no dots on the
roof of Morgue no.
1 of Crematorium
II, and this exposure
was taken by a dif-
ferent plane.

Chapter 5.8

Were the two large crematoria destroyed before or after Russians entered camp?

Dismantling the two crematoria. The facts are:

- (a) The Dec. 21st, 1944, and Jan. 16th, 1945, photos show no change in dismantling of Crematorium II and III. The buildings' roofs and the chimneys are missing. In addition, the reinforced concrete roofs of Morgues No. 2 (the alleged undressing room) have caved in. They could be removed only with explosives.
- (b) The German camp guards left Auschwitz in January 1945.
- (c) The Soviet Red Army entered the camp on 27th January 1945.
- (d) The February 19th air photos show both buildings flattened as if by explosions.

Photo 9 – Dec. 21, 1944:

both crematoria have been partly dismantled

the roofs appear to have been removed; the roofs of Morgues #2 have caved in

the chimneys have been removed

Photo 10 – February 19, 1945:

both of the buildings appear to be completely flattened as if by explosions

Chapter 5.8

Thousands cremated a day at Birkenau – accusations versus photo evidence

Allegations of eyewitnesses:

What 1944 air photos actually reveal:

The crematoria were in a corner of the camp surrounded by a special security system.

There was a ditch but no wall and until May 1944 not even an obscuring fence or hedge. People on the roads or farms outside could see the yards and crematorium buildings.

The two large Crematoria II & III were surrounded by fences or rows of trees obscuring the view.

Thick lines appear on the Aug. & Sept. 1944 photos. A May 1944 photo shows merely a partial line only around Crematorium II.

Thousands a day walked into underground rooms to be executed.

These sights would have been visible to people outside and inside the camp.

Gas pellets were inserted through four roof vents to kill the people.

Marks way too big for vents appear to have been drawn on May, June, and August photos, so they were not there originally.

Enough coal or wood to burn the bodies was piled in the yards.

No piles of coke or wood are visible on any of the air photos taken during 1944.

Thousands of bodies were burned each day in the cremation furnaces.

No fuel delivery system existed such as a coal piling yard beside the train tracks or the crematoria, and no conveyor system existed.

Smoke rose out of the crematoria chimneys.

No Smoke is seen on any air photos taken in 1944.*

In the summer of 1944 hundreds, if not thousands of bodies were burned every day on pyres in pits behind some of the crematoria.

Four photos show smoke rising from a small area north of Crematorium V (see pp. 98-101). One pit occurs behind each crematorium, perhaps dug to bury coal ashes.

**Photo 11 – May 31, 1944 (top), and
Photo 12 – August 25, 1944**

All 1944 air photos reveal that the Birkenau crematoria were visible from outside the camp and gave off no smoke from their chimneys. They had no coal storage or delivery system, hence they had been designed to each cremate a small number of corpses per day. Outdoor fires were very limited in size.

*On a refutation of one claimed exception see Bartec.

Chapter 5.8

Comparing the Katyn murder site to the alleged Birkenau murder site

Katyn

Birkenau

Photo 13 – Oct. 13, 1943

4,400 shot and buried in 5 weeks from April 3 to May 11, 1940 = 120 per day.

In the center of a one square kilometer (2/5 of a square mile) forest beside a narrow road.

No witnesses, since conducted in forest with one access road and no farms or houses.

1942 photos show a 350-meter (1,150-ft) narrow winding road through the forest.

1942 and 1943 photos show an area cleared of trees beside the access road.

No local villagers or spies witnessed the killings, so the Germans had no reason to look for the gravesite on existing air photos or to take new photos.

Bombing was not an option.

1,000,000 gassed and burned in 2½ years from 1942 to 1944 ≈ 1,100 per day.

In 4 crematoria and 2 farmhouses, unobscured at edge of, or near, a labor camp surrounded by active farms.

Many witnesses, as the lack of obscuring features gave everyone in the area an excellent view onto all crimes scenes until May 1944.

1944 photos show a wide straight road without trees exists between Crematorium II & III.

1944 photos show no smoke coming from chimneys, and only little smoke from outdoor fires.

Allies received reports on mass murders from Auschwitz since summer 1942, so they had important reasons to study all the 1944 Birkenau air photos.

Crematoria could have been bombed.

Photo 14 – May 31, 1944

Chapter 5.8

Comparing Auschwitz I and I.G. Farben plant to Birkenau

1. Solid obscuring walls around other objects versus wire fences around Birkenau

Auschwitz I: some mass murders are alleged; a solid wall prevented villagers on some sides of the camp from looking inside.

I.G. Farben plant: murders and mistreatment are not alleged, but a wall surrounded the plant.

Birkenau crematoria: alleged 1,400 murdered daily, yet until May 1944 nothing was done to conceal the area.

2. Coal piles at the producer-gas-producing plant versus absence of coal at the crematoria

gas production plant

over a hundred tons of coal a day were processed at the chemical plant (1) to release CO gas used to make synthetic oil

22.4 tons of coke/day, at 16 kg of coke/body, would have been needed to cremate average 1,400 bodies a day (Mattogno/Deana)

coal storage yards and 80-meter (260-ft)-long coal piles (2) beside the rail lines (3) to ensure steady coal supply

no coke storage yards or coke piles beside the rail lines or in the crematorium yards

70-meter long coal conveyor systems (4)

no coal conveyors

Birkenau crematoria

Chapter 5.9

Crematoria IV & V with Alleged Gas Chambers at Birkenau Visible from Outside

Anyone attending the disinfestation facilities “Zentral-sauna” had a clear unobstructed view of these Crematoria IV & V.

The chimneys were small and square unlike the large rectangular Crematorium II and III chimneys. There was no railway spur for fuel delivery.

Photo 1 – May 31, 1944

A new building has been constructed.

The black line is too thick for a wire fence yet has *no* apparent shadow. It may be the “wicker fence” described on pp. 70-74.

No evidence of the claimed burning pits.

Photo 2 – September 13, 1944

Chapter 5.9

Two dates show no smoke but appearance of a black line

Photo 3 – May 31, 1944

No visible wall or hedge around the buildings.

In the first edition of this book classified as a photo showing no smoke, this had to be revised, as a plume of smoke does rise from a small area. See more on next page.

Photo 4 – June 26, 1944

No visible wall or hedge around the buildings.

No smoke from the claimed burning pits.

Photo 5 – September 13, 1944

No smoke from the claimed burning pits.

A black line looking like a hedge surrounds one building and another line surrounds half of the other building.

Chapter 5.9

Four dates show small amounts of smoke rising from backyard of Crematorium V

section enlargement of white box

Photo 6 – May 31, 1944, Exposure 3055 (top and right)

These two photos of the Birkenau Camp were exposed by a U.S. aircraft at a time when many thousand Hungarian Jews are said to have been murdered every day. Since the crematoria are said to have had an insufficient capacity, the corpses of the victims are said to have been incinerated in huge pits behind Crematorium 4 and west of the camp (see Chapter 5.10) using wood as fuel. Wood fires usually emit white smoke. This smoke would have blanketed the whole area downwind. On both exposures a small plume of smoke can be seen rising from the yard just north of Crematorium 4 (arrow). The area from which it emerges is at most several square meters large. There are more photos from later dates also showing white smoke, although it rises from a different spot, see next pages.

Photo 7 – May 31, 1944, Exposure 3056

Chapter 5.9

Photo 8 – July 8, 1944: (top and section enlargement left)

This is a German air photo of the Birkenau Camp taken during the alleged extermination of the Hungarian Jews. The claimed pits behind Crematorium V allegedly used to dispose of the bodies on pyres would have had to be huge. Judging by the size of cremation pits operated during major outbreaks of cattle epidemics (see Köchel), these claimed pits would have covered thousands of square meters, and their white smoke would have blanketed the area downwind. Even if, by chance, those fires were not burning when the photos were taken, massive mountains of fuel wood and huge pits with large swaths of disturbed soil around them would still be visible, but they are not. On this photo, a small conical plume of smoke can be seen rising from the yard of Crematorium V (arrow, see section enlargement to the left). The area from which it emerges is at most several square meters large. This is the only smoke visible on this photo.

Chapter 5.9

Photo 9 – Aug. 20, 1944: (top and section enlargement of white box on the left)

This is an Allied air photo of the Birkenau Camp. The wind is coming from the south. Again, a plume of smoke can be seen rising from the yard of Crematorium V (see arrow in the section enlargement to the left), but it does not get driven very far before dissipating, indicating that the wind is rather light and the fire small. The area from which it emerges is the same as on the previous photo. It is again a rather small area. In this case as well this is the only smoke visible on this photo.

Photo 10 – Aug. 23, 1944 : (top and section enlargement of white box on the left)

The last photo in this series was taken by a U.S. reconnaissance aircraft just three days after the previous image. It has the best resolution. The wind has turned east, similar to the July 8 photo. Here, too, a plume of smoke can be seen rising from the yard of Crematorium V (arrow, see section enlargement to the left), and it dissipates in a conical shape, which again points to a rather small area from which the smoke originates. It goes without saying that it is impossible to know what was burned there during those months. But it is possible to say that it is a fire of rather limited size incompatible with the gargantuan pyres necessary if the eyewitness accounts of thousands of victims burned daily were true.*

* For a thorough discussions of these allegations, including an evaluation of the air photos discussed here, see Mattogno, *Auschwitz: Open-Air Incinerations*, esp. pp. 57-79. See also Köchel's contribution therein.

Chapter 5.9

Crematoria IV & V beside disinfestation facilities alleged to have contained gas chambers

Eyewitnesses allegations:

What documents and 1944 air photos reveal:

The two buildings next to the disinfestation facilities were crematoria with gas chambers, similar to Crematoria II and III.

Documents prove these Crematoria IV & V had large water and sanitary installations, hence these were sanitary facilities.*

The buildings were surrounded by visual shields to prevent witnesses from seeing gassing executions.

May and June 1944 photos show no shields, but on the September photo a thick black line appears.

Thousands a day walked into rooms to be executed by gas.

Absence of shielding allowed everyone in the area to observe this.

Thousands of bodies were burned each day in the crematoria.

No fuel delivery system exists such as train tracks, a coal piling yard, and a conveyor system.

Coal and wood to cremate the bodies were stored in the yard.

No piles of coke or wood are visible on the 1944 air photos.

Smoke rose out of the crematorium chimneys.

No chimney smoke is seen on any of the air photos taken in 1944.

Hundreds of bodies were constantly burning on pyres in pit(s) behind at least one of the crematorium buildings during the spring and summer of 1944.

4 dates show smoke rising from an area north of Crematorium V. The small size of the fire producing it is incompatible with the claims.

Photo 11 – May 31, 1944

Summer 1944 air Fotos of the Crematoria 3 & 4 close to the disinfestation facilities (“Zentralsauna”) reveal they were visible from outside the camp and had no smoke rising from the chimneys. There are no huge cremation pits emitting large clouds of white smoke blanketing the area either.

* The first edition of this study surmised that the buildings were not crematoria but may have served other purposes. This hypothesis has been thoroughly refuted; on this see Pressac 1989, pp. 379-428, and in particular, refuting Pressac’s homicidal claims, Mattogno, *Real Case...*, pp. 143-162, esp. pp. 158-162.

Chapter 5.10

The Alleged Mass Cremations Near “Bunker 2” West of the Birkenau Camp

Allegations

1. For reasons of security and secrecy, the homicidal gassing activity of Auschwitz, which had started in the main camp (Auschwitz I) in late 1941/early 1942, was moved to two converted farmhouses near the Birkenau Camp in early 1942. The farmhouses are referred to either as Red and White Cottage or as Bunker 1 and 2.
 2. These farmhouses are said to have had no technical equipment to accelerate the evaporation, dissipation and eventual ventilation of the poison gas used (Zyklon B = hydrogen cyanide). These homicidal gas chambers were improvised make-shift solutions.
 3. When the alleged homicidal gas chambers in the crematoria of Birkenau are said to have gone into operation in early 1943, the Bunkers were allegedly retired (Bunker 1 is said to have been dismantled).
 4. During the claimed massive extermination of about 400,000 Hungarian Jews between mid-May and August/September 1944, Bunker 2, located west of the “Zentralsauna” (see no. 4 of map on p. 56), was reactivated.
 5. During those spring and summer months of 1944, tens of thousands of Jews were allegedly gassed in Bunker 2 and subsequently incinerated on huge pyres in pits near that building.
 6. The area around Bunker 2 was therefore blanketed in smoke during that time.
 7. The foundation walls of Bunker 2 can be seen to this day (see photo below).
- (Ref.: Pressac 1989, pp. 171-182)

Photo 1: The foundation walls of the alleged “Bunker 2” seen from the southwest.
July 1992, © Carlo Mattogno

Photo 2 – May 31, 1944: boxed-in area enlarged below. The pentagon-shaped area cleared of trees and with several objects visible is said to have been the zone of “Bunker 2.” The area was visible from surrounding fields where inmates from other camps and German officials worked who were not involved in the claimed exterminations.

Photo 3 – May 31, 1944 (top, section enlargement of Photo 2)

Photo 4 – June 26, 1944: Only the lower half of the area of “Bunker 2” can be seen on this photo. Neither this one nor the previous photo or any other shows any large-scale activities, large amounts of firewood stacked up, or huge pyres emitting copious quantities of smoke blanketing the area downwind.

Photo 5 – Aug. 23, 1944: boxed-in area enlarged below.

Photo 6 – Aug. 23, 1944: (right, section enlargement of Photo 5) A comparison of this photo with Photo 3 of May 31 reveals that most objects have not changed at all. The only major change is the addition of two buildings on two of the previously light-colored rectangles, spots that had obviously been cleared from vegetation in preparation for these buildings (see also Photo 4).

Photo 7 – Sept. 13, 1944: (left) This photo is slightly overexposed. Still, all the objects visible on the other photos are still where they used to be. And again: no smoke, no fire, no wood piles, no large-scale activities.

Conclusions

All air photos of Birkenau showing the area where “Bunker 2” is said to have been show several structures. Except for two buildings which were constructed between May 31 and June 26, not much changed between May 31 and September 13, 1944. In particular, the photos do not show any smoke, large amounts of firewood stored, or massive earth-scarring activities going on. Claims about huge pyres upon which tens of thousands of murdered Jews were burned are therefore wrong. The fact that two buildings were erected in this area at the time of the deportation of the Hungarian Jews suggests that the area was indeed used for some activity in this context. But from the above air photos it can safely be concluded that extermination activities were not part of it.

(For more see Mattoigno, *Debunking the Bunkers of Auschwitz.*)

Photo 8 – May 31, 1944: Top: The way the camp really looked. Consider that 33,187 Hungarian Jews arrived at Auschwitz on the days of May 28 through May 31, 1944, hence on average a little more than 11,000 each day. The vast majority of them is said to have been killed on the spot and cremated. Since the crematories could have cremated only a small fraction of those bodies, most of them had to be cremated on gargantuan pyres outdoors. These are said to have been located behind Crematorium V and around Bunker 2. Below: an artist's rendition of how that air photo of May 31 would have looked like, if the claims of wholesale slaughter and mass cremations were true: huge smoke clouds (see Mattogno, *Auschwitz: Open Air...*, pp. 57-65).

Chapter 5.11

The Bombing of the I.G. Farben Industrial Complex

Photo 1 – Sept. 13, 1944:

On September 13th, 1944, 96 U.S. bombers flew at 7,500 meters altitude directly over Birkenau and dropped 943 five-hundred-pound (225 kilogram) “high-explosive” bombs on the I.G. Farben industrial plant from 11:17 to 11:20 a.m.

The first actively firing anti-aircraft guns which the planes encountered were next to the Sola River about one kilometer from the Auschwitz I Camp.

The majority of the 943 bombs landed in the industrial area, however, about 20 landed almost directly on top of these anti-aircraft guns one kilometer from Auschwitz I.

(Ref.: *Interpretation Report number D. B. 217*. Bombing damage report.)

Chapter 5.11

Photo 2 – Sept. 13, 1944:

As the planes flew west to east, they released their bombs directly over Birkenau in order to hit the industrial plant. Here 9 bombs are released initially travelling 320 kilometers (200 miles) per hour from west to east.

Because no anti-aircraft guns were firing from this area, either large bombers or smaller Mosquito fighter bombers could have precision bombed the crematoria with a minimum of danger.

Photo 3 – Sept. 13 1944: (right)

Buildings in the synthetic-rubber section were hit by a group of 8 to 10 of the 230-kilogram (500-pound) bombs.

Chapter 5.11

Photo 5 : (above)

A battery of German 88-mm anti-aircraft guns. (Ref.: Middlebrook, M.)

Photo 4 – Sept. 13, 1944: (right)

One bomb landed directly across the river 300 meters (1000 feet) from Auschwitz I. Other bombs appear to have been dropped to try and strike the anti-aircraft emplacements that are identified by the lines of white smoke rising from the roadway (although they might be smoke canisters as decoys). At least one smoke source, and perhaps more, appear to have received direct hits.

**Photo 6 –
Dec. 21,
1944:**

There are no round craters or other signs of previous bombing destruction visible in this December 1944 photo. Because the light-coloured snow is in contrast to the darker man-made items, structures such as the guard towers, buildings, railroad tracks and unloading ramp are clearly visible.

**Photo 7 – Dec.
21, 1944:**

At the I.G. Farben site: evidence of bombing included craters and building damage, as in this southern part of the synthetic-oil section.

Chapter 5.11

The reasons why the Birkenau crematoria were not bombed

What historians say:

Spies for the British and U.S.-Americans in the Auschwitz camp area were not aware Jewish people were being exterminated and burned at Birkenau because “special security arrangements” around the gas chambers and crematoria prevented anyone from seeing inside.

What air photos reveal:

The May 1944 photos reveal that until then the crematoria were not obscured by any kind of shielding such as hedges or walls. For two kilometers in all directions, the area’s roads were free of any gates, checkpoints and guardhouse. The area where Bunker 2 is said to have been was completely exposed.

Photo 8 – May 31, 1944

What historians say:

If a few people did observe the exterminations, but spy reports and maps were either not getting out or they were not received by military personnel in England and the U.S.

What air photos reveal:

The May 1943 spy map of the industrial complex was received by the American military before January, 1944 (see page 28), and the War Refugee Board telegram describing the alleged exterminations was received in July 1944 (see page 86).

Photo 9 – April 4, 1944

What historians say:

Air-photo interpreters were not informed that mass exterminations may be occurring, and therefore, when viewing the air photos of Auschwitz I and Birkenau, they thought they looked like standard work and detention camps.

What air photos reveal:

Air-photo interpreters would have been given spy reports and other information concerning the camps before June 1944 when they received the first air photos of Birkenau and used their knowledge of industrial facilities to analyze them.

Photo 10

Chapter 5.11

More claims of some historians versus what the 1944 air photos reveal

Photo 11 – Aug. 25, 1944

What historians say:

If photo interpreters were given spy reports such as the War Refugee Board telegram (see page 86) describing mass gassings and cremations, they still could not identify the crematoria.

What air photos reveal:

The skilled air-photo interpreters would have quickly identified the two big crematoria with large chimneys in wide yards outside the residential part of the camp, and determined the number of corpses they were designed to cremate.

Photo 12 – Sept. 13, 1944

What historians say:

If officials knew the locations of the gas chambers, the area was too far from British airfields to conduct bombing raids.

What air photos reveal:

On four days from August to December 1944, U.S. aircraft bombed the I.G. Farben complex. On September 13th they released their bombs directly over the Birkenau crematoria.

Photo 13 – Sept. 13, 1944

What historians say:

Attempting to bomb the gas chambers from standard bombing height would have resulted in the deaths of thousands of camp inmates.

What air photos reveal:

Planes bombed anti-aircraft guns one kilometer ($\frac{5}{8}$ of a mile) from Auschwitz I and also the industrial factories. The large crematorium buildings with their big yards detached from the residential areas could have been bombed with a minimum of collateral damage.

Chapter 5.12

Cyanide Sampling from Buildings Where Cyanide Gas Was Allegedly Used

Background

During wartime, infectious diseases regularly cause more deaths than the actual warfare. The reason for this is the breakdown of hygienic conditions and the crowded, improvised living conditions of soldiers and prisoners of war.

One of the frequently lethal diseases spreading fast during wartime is typhus, which is transmitted by the body louse.

Before the discovery of DDT's insecticidal properties in 1939 and its more benign successors, few means were available to efficiently fight the body louse. One potent but also dangerous insecticide is hydrogen cyanide (HCN). It is lethal to both insects and warm-blooded animals, humans included.

After the First World War, German chemists developed a product based on HCN which could be stored and applied with relative safety. It bore the name Zyklon B. It has been used all over the world as an insecticide ever since, including today, although the name was changed in the late 1970s.

Zyklon B During WWII

During the Second World War, Zyklon B was used by all belligerent powers. In addition to the usual civilian uses of Zyklon B for pest control, the Germans and their allies used it to disinfest their soldiers' and PoWs' clothes, and it was also used on a grand scale to disinfest the clothes and bed linens of the Axis's prisoners and concentration camp inmates.

All major German concentration camps had either provisional or permanent disinfestation chambers. Many of them used Zyklon B. Some have survived the war and can be inspected to this day. The most famous examples are the highly sophisticated DEGESCH circulation chambers at the Dachau camp and the various, less-professionally designed delousing facilities at the Auschwitz, Birkenau, Majdanek and Stutthof camps.

Hydrogen Cyanide Reacts with Wall Material

It has been known for many decades that the walls of the extant, less-sophisticated delousing chambers in the former German concentration camps at Auschwitz, Birkenau, Majdanek and Stutthof exhibit a patchy blue discoloration. Analyses have shown that this blue discoloration stems from iron cyanide compounds.

The reason for the presence of this blue pigment in those walls is that HCN can easily penetrate into walls, if they are not sealed with a waterproof paint.

Cyanide in turn is known for its tendency to form very stable bonds with iron. The most stable of them is a complex compound called Prussian Blue – which is, well, blue.

All building materials – brick, sand, cement – consist of up to 5% of iron compounds (rust). Hence, if an unsealed wall is exposed to HCN and if the conditions are right (fresh, moist and cool cement is helpful), then stable iron cyanide compounds will form. They are just as stable as the walls themselves. Once formed, they will last basically forever.

Delousing-chamber walls in former German concentration camp are not the only walls that have turned blue after exposure to HCN. Two cases of churches are known whose walls turned just as patchy blue after having been exposed to HCN.*

Cyanide Forensics

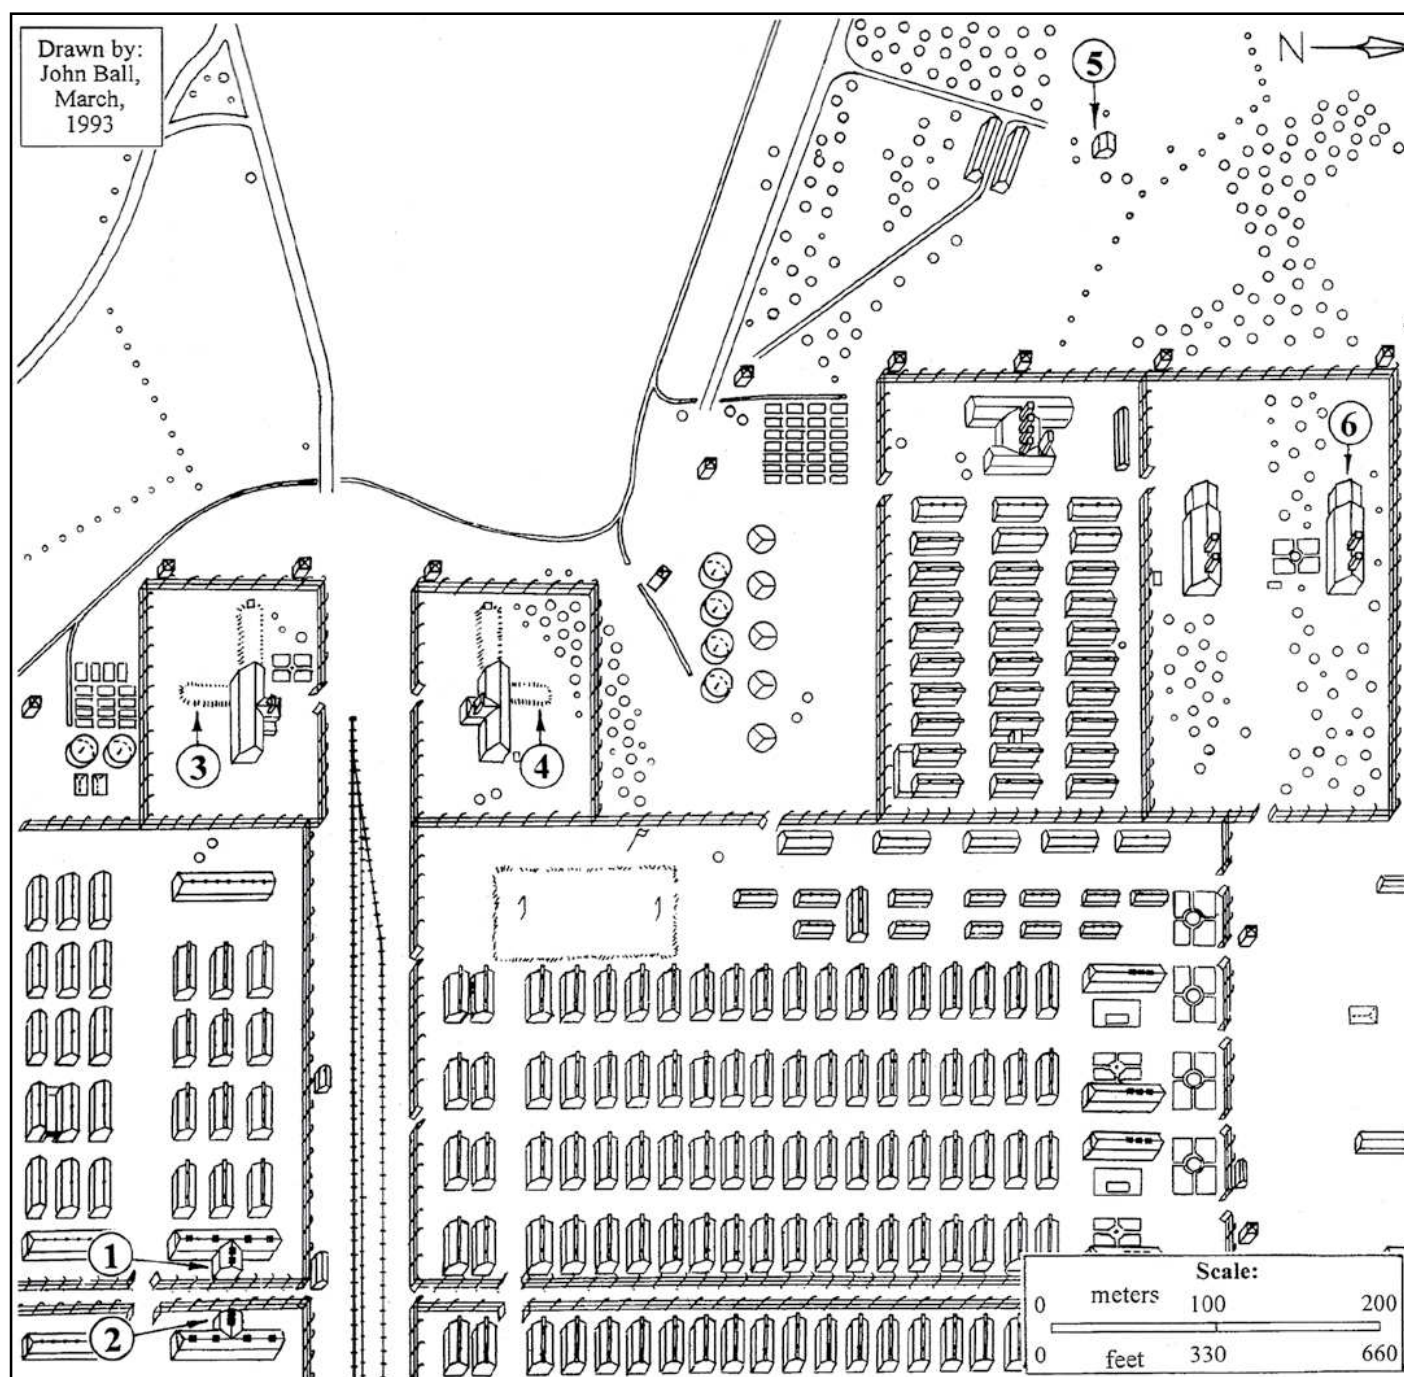

Analyzing wall samples for residual cyanide stemming from exposure to HCN is therefore an important forensic tool to verify whether a room has been repeatedly exposed to this poisonous chemical. This is particularly true for the rooms which are said to have been used as homicidal gas chambers using Zyklon B as the lethal agent.

In 1993 John Ball took wall samples in Auschwitz and had them analyzed for their total cyanide content. The following pages report the results.

*For more details on the use of Zyklon B prior to and during WWII, the formation and stability of Prussian Blue in building materials – including the two church cases mentioned – as well as the relevance of cyanide detection for extermination claims in alleged homicidal gas chambers see Rudolf, *The Chemistry of Auschwitz*.

Chapter 5.12

Sampling locations

1

Zyklon B cyanide gas in a ventilated room killed typhus-carrying body lice in clothing and bedding

2

(same as 1) a blue cyanide residue called Prussian Blue today coats the walls and shows previous cyanide gas use

3

alleged: cyanide gas was used in an underground morgue to kill people in batches of 1,000 to 3,000 for 1.5 years in 1943 and 1944

4

(same as 3)

5

alleged: cyanide gas was used in the White Cottage/Bunker 2 to kill thousands of people during 1942 and 1944

6

alleged: cyanide gas was used in one, two or three rooms to kill thousands of people during 1943 and 1944

Chapter 5.12

Average amount of cyanide in the ten samples from each location

Measurement: (columns)

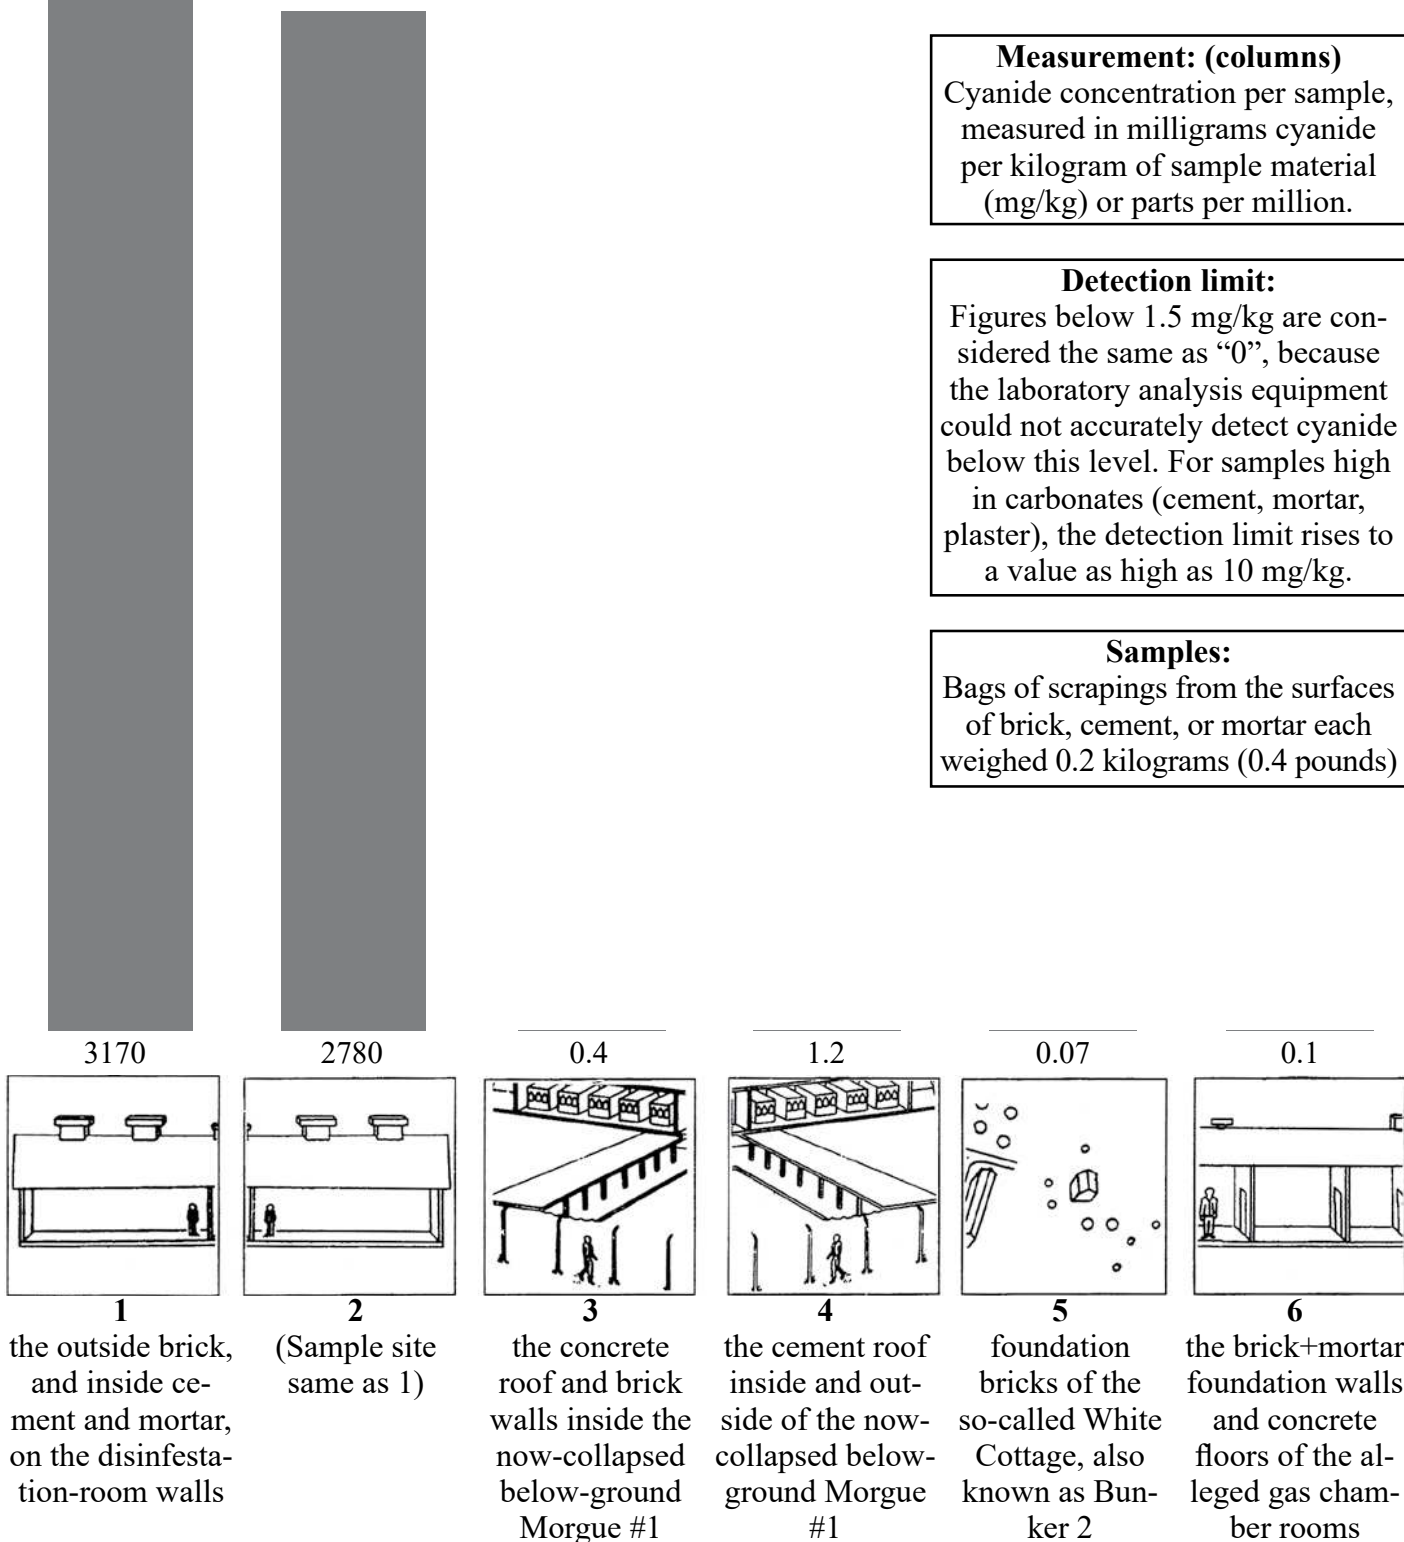

Cyanide concentration per sample, measured in milligrams cyanide per kilogram of sample material (mg/kg) or parts per million.

Detection limit:

Figures below 1.5 mg/kg are considered the same as "0", because the laboratory analysis equipment could not accurately detect cyanide below this level. For samples high in carbonates (cement, mortar, plaster), the detection limit rises to a value as high as 10 mg/kg.

Samples:

Bags of scrapings from the surfaces of brick, cement, or mortar each weighed 0.2 kilograms (0.4 pounds)

Results: 1 and 2 had high values
Reason: cyanide bonded with iron in the bricks, cement, and mortar
Conclusions: cyanide gas was used at least once to allow cyanide to bond with iron in the walls

Results: 3 to 6 had extremely low values below the detection limit; the cyanide values are considered to be "0"
Reason: cyanide did not bond with iron in the walls, floors or ceilings of these rooms
Conclusions: sample results show that cyanide gas was not used in any of these rooms

Chapter 5.12

Analytic results of samples taken by three different samplers

John Ball was the fourth person to take samples at Auschwitz and analyze them for cyanide residues.

The first was U.S. expert for execution technologies Fred A. Leuchter, who took samples in early 1988 in preparation for his famous *Leuchter Report*.

The second was German chemist Germar Rudolf in preparation for his expert report.

The third was a Polish team led by Jan Markiewicz on behalf of the Auschwitz Museum. They took their first set of samples in 1991 and a second set in 1994. However, they used an analytic method which cannot detect longterm stable iron cyanide compounds – the only compounds stable enough to be still detectable today. As a consequence, the Polish team did not find any cyanide amounts beyond the generally recognized detection level in any of their samples. It has been suggested that the Poles' decision to exclude the only thing worth looking for was based on their desire to produce results where both delousing chambers and alleged homicidal gas chambers end up having similar values. In other words: the Polish work is fraudulent.*

The table to the right contains the analytic results of all three pertinent samplings made so far. They all point in the same direction:

None of the alleged homicidal gas chambers has any cyanide residues above the detection level, whereas samples from delousing chambers have extremely high values.

Cyanide concentrations in the walls of alleged homicidal gas chambers and delousing chambers at Auschwitz/Birkenau			
No.	Sampling Location	Sampler	c[CN ⁻] mg/kg
1-7	Crematory II, mortuary 1 ('homicidal gas chamber')	Leuchter	0.0

25	Untreated brick from collapsed Bavarian Farmhouse	Rudolf	9.6/9.6

Concentrations are in mg of cyanide (CN⁻) per kg of building material (brick, mortar, concrete, plaster). Cyanide values of less than 10 mg/kg are uncertain, samples returning values of less than 1-2 mg are considered cyanide-free. If two values are given, the second value gives the result of a control analysis performed by a different company and a slightly different method.

* For details about Leuchter's sampling see Leuchter/Faurisson/Rudolf; for Rudolf's sampling and for a discussion of all samplings and analyses performed so far see Rudolf, *The Chemistry of Auschwitz*; for a critique of the Polish analyses see there, esp. pp. 338-344, and: Rudolf/Mattogno, pp. 47-69.

Chapter 5.13

Possible Mass Graves Visible on Air Photos

Photo 1 – May 31, 1944:

On this air photo of Birkenau, three areas with a number of rectangular shapes can be seen west of the camp. The light color of the three rectangles west of the “Zentralsauna” (white circle, center top) and of the four rectangles located in a wooded area north of Crematorium V (white ellipse) indicates that the ground vegetation was recently removed. No shadows can be seen, so the objects have neither considerable height nor depth. The area around the objects is undisturbed, hence no large-scale activities happened there recently. The shapes west of Crematoria II & III and west of the “Zentral-sauna” have an innocuous explanation, see next page. If the other shapes were indeed mass graves, then they cannot have been very deep, as the high groundwater level in that area swiftly fills pits deeper than one meter with groundwater.*

* The ground water stood at 1.20 m below the surface; see Wallwey and also Mattogno, “Cremation Pits”...

Chapter 5.13

Photo 2 – May 31, 1944

(section enlargement of Photo 1)

The Sept. 13 photo (right) shows two buildings (arrows) on two of the spots which on the May 31 photo (left) had a bright color as if their vegetation had been removed. The third spot was left unused.

Hence these spots were created in preparation for constructing these buildings.

Photo 3 – Sept. 13, 1944

Photo 4 (top and right) – May 31, 1944

(enlargement of Photo 1)

The shapes visible west of Crematoria 1 & 2 (Photo 4) look different than the other objects, as they are surrounded by thin dark lines. They are located in the midst of farm fields in the township of Plawy. This location was accessible from five roads, of which only

one comes from the Birkenau Camp. These shapes have never been implicated in any activities connected with claimed exterminations, and the place seems too far away from the camp to have served for the burial of corpses. It is therefore likely that these shapes have an agricultural background.

Photo 5 – May 31, 1944

(section enlargement of Photo 1)

This leaves us with the four elongated shapes in the wooded area north of Crematorium V (Photo 5, left). The light color suggests that the vegetation was recently removed, but if these are freshly covered mass graves, the area around them would be just as denuded of vegetation caused by the labor crews moving corpses and soil. So they must be older. On later photos (next page) the shapes are less visible, both because the canopy of surrounding trees hides them and probably because vegetation has grown on them. If we assume graves of 2 m depth with a cover layer of 1 m and a realistic density of 2, and a maximum density of 5, corpses per m³, we calculate as grave capacities:

$$3 \times (100 \text{ m} \times 10 \text{ m}) + 1 \times (130 \text{ m} \times 10 \text{ m}) = 4,300 \text{ m}^2$$

$$\text{volume at 1 m depth: } 4,300 \text{ m}^3 \text{ (151,900 ft}^3\text{)}$$

$$\text{realistic: } \mathbf{8,600 \text{ corpses}} \text{ (absolute maximum: 21,500 corpses)}$$

Chapter 5.13

Photo 6 – June 26, 1944

Photo 7 – July 8, 1944

Photo 8 – Aug. 23, 1944

On three later air photos the four long rectangular shapes in the wooded area north of Crematorium V can still be seen, but they have blended in considerably with the surrounding vegetated area.

What we should expect to see

The only real evidence of mass graves at Auschwitz are therefore the four objects north of Crematorium V.

Looking at the camp's history, we learn that the first mass graves at Auschwitz were dug already in the winter of 1941-1942, because from October 1941 to February 1942, 8,320 Soviet PoWs died in Birkenau according to the *Totenbuch* (register of the deceased), while the old crematorium at Auschwitz could hardly keep up with cremating the dead inmates of this camp as recorded in the *Leichenhallenbuch* (morgue register) of Block 28. To make matters worse, in July 1942 a typhus epidemic broke out in the Birkenau Camp. It reached its peak a month later, when some 8,600 inmates died during that month alone, almost double as many as during the

Photo 9 – 1997

previous month (about 4,400 deaths; ref.: Pressac, *Les Crématoires*, pp. 144ff.). Also starting in the summer of 1942, the old crematorium was inoperable due to major damage to its chimney. No other cremation facility existed at that time. Hence, in the summer of 1942 the corpses of many thousand inmates who had succumbed to the epidemic could not be cremated. They were also initially buried in shallow mass graves. However, due to the high ground water level in the area – see Photo 9 and the footnote two pages earlier – these corpses threatened to poison the entire region's fresh water supply. For this reason they had to be exhumed and were probably incinerated on large pyres. This gruesome task was most likely performed by inmates in late 1942. (Ref.: Czech, pp. 108, 242, 275, 278.) No air photos or ground-level photos of these activities exist, but these horrific events may be the true core of inmate stories about thousands of corpses being burned on pyres in pits.

The air photos of 1944 do not show any activities resembling the events that must have unfolded at Birkenau in late 1942. However, traces of shallow temporary mass graves could potentially be visible on air photos taken some 1½ years later. The rectangular shapes north of Crematorium V may be such traces. Only excavations of the relevant areas could yield evidence to support or refute this thesis, but as far as is known, no such investigations have been undertaken by the Auschwitz Museum so far.

According to Danuta Czech's *Auschwitz Chronicle*, 68,000 persons were gassed and buried in 1942 until the mass graves were exhumed and the disinterred corpses were cremated on pyres (starting on September 21, 1942). Hence 4,300 m³ of grave space available would have had to accommodate $(68,000 \div 4,300 =)$ about 16 corpses per m³, not to mention the tens of thousands of bodies of deceased Soviet PoWs and of the typhus epidemic's victims. This would bring the density in those graves well over 20 bodies per cubic meter – a physical impossibility.

Chapter 6

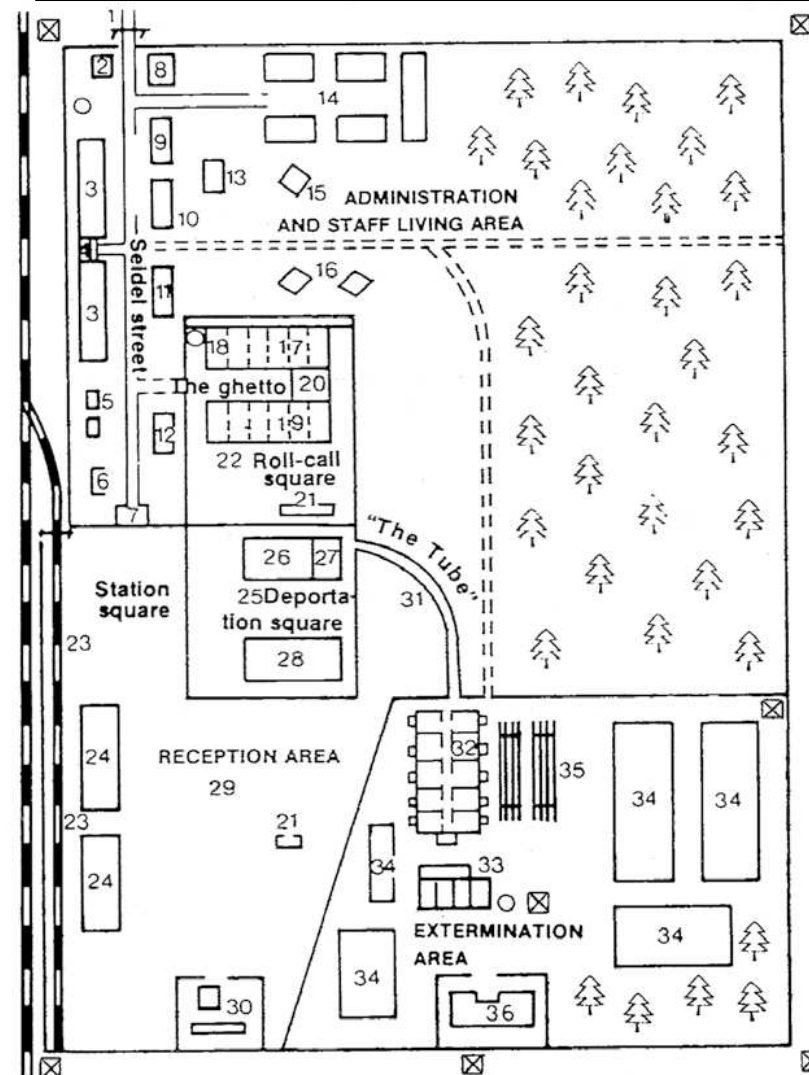

800,000 Allegedly Gassed and Cremated in the Treblinka Camp

The Treblinka II camp, measuring 470 by 370 meters (1540 by 1210 feet), was established in 1942 on a branching rail spur which led to a gravel-pit camp established in 1941 (Treblinka I). From July to September 1942 a total of 360,000 Jews, or 4,000 per day, were allegedly killed at Treblinka II and buried in large graves in one corner of the camp. (Ref.: Arad, Y., page 127) In 1942, when the three 5 m × 5 m (16 ft × 16 ft) gas chambers were supposedly unable to process enough people, 700 prison workers are said to have been brought in to build ten new concrete 7 m × 8 m (23 ft × 26 ft) gas chambers, 5 on each side of a corridor, serviced by a narrow-gauge railway line. (Ref.: Ehrenburg/Grossman, pp. 416f.) From Sept. 1942 to May 1943 a further 440,000

Jews, or 1,600 per day, were allegedly gassed and buried in the southeast corner of the camp (an area shown on maps by survivors as about 90 m × 70 m / 300 ft × 230 ft).

From February to September 1943, the 800,000 bodies, or 3,300 per day, were supposedly dug up, and piles of 2,000 to 3,000 were burned on pyres built on railroad tracks. The resulting 10-m (33-ft)-high flames and smoke could be seen for a long distance. (Ref.: Arad, Y., page 175)

In September 1943 the buildings were allegedly cleared, pine trees were planted, and the area was made to look like a farm. When the Soviets arrived in 1944, they found only some bones as evidence of the 800,000 claimed victims. (Ref.: Donat, A., *The Death Camp Treblinka*.)

Location Map:

Chapter 6

Location of the camp in relation to farmland, towns, and railroads

Photo 2 – May 15, 1944: The pentagon-shaped area of the former Treblinka II camp. On the left of it is the rail line and road going down to the gravel-pit camp Treblinka I at the bottom left of the photo. On the right is Wolka Okraglik village just up from the main railroad line going north. Almost all of the rectangular farming plots around the villages appear to have been worked in 1944.

Chapter 6

The Treblinka II Camp: eyewitness accusations

Claims about the number of victims, the murder weapons used, the way the corpses were disposed of, and the time sequence and duration of the events are contradictory. The claims summarized at the beginning of this chapter were selected arbitrarily by their respective authors. A critical analysis of the various claims in combination with other evidence results in the following least-unlikely scenarios:*

From late July to end of October 1942 (ca. 100 days), some 680,000 people, or 6,800 per day, were killed in three gas chambers of together 48 m². The victims' bodies were buried in mass graves in the southeast corner of the camp (an area about 90 by 70 meters).

From November 1942 to early summer 1943 (some 200 days), some 190,000 more people, or 950 per day, were killed in 13 gas chambers totalling 368 m². Burying the corpses continued until early 1943 up to a total of roughly 800,000.

Between April and the end of July 1943 (some 120 days), about 870,000 bodies, or 7,250 per day, were dug up and burned day and night on gigantic pyres built on railroad tracks using little wood as fuel.

In September 1943 the buildings, fences, and watchtowers were removed and the area was made to look like a farm.

150 meters
480 feet

Photo 3 – May 15, 1944

**After viewing air photos on the next pages
these accusations will be answered.**

* See the critical analysis by Mattogno/Graf, *Treblinka*; see also Mattogno/Graf/Kues, esp. pp. 939-952; and Hunt's *The Treblinka Archaeology Hoax*.

Chapter 6

Photo 4 – May 15, 1944: (right)

There is a clear unobstructed view 300 meters (1000 feet) across farms from the road and rail line north of Wolka Okraglik to the camp's location. The trees are a few rows deep. Farms appear actively worked.

Wolka Okraglik village

Photo 5 – May 31, 1944: (left)

There are 86 houses and other buildings in this portion of Wolka Okraglik village. The road through town proceeds north and parallels the railway line to pass within 300 meters of the camp.

Chapter 6

Photo 6 – After 1970: Looking southeast across the symbolic reconstruction of the gravel-pit railroad towards the Treblinka monument. The trees in the foreground do not appear to have changed position since 1944. Wolka Okraglik village is off the photo to the left and the gravel pit to the right.

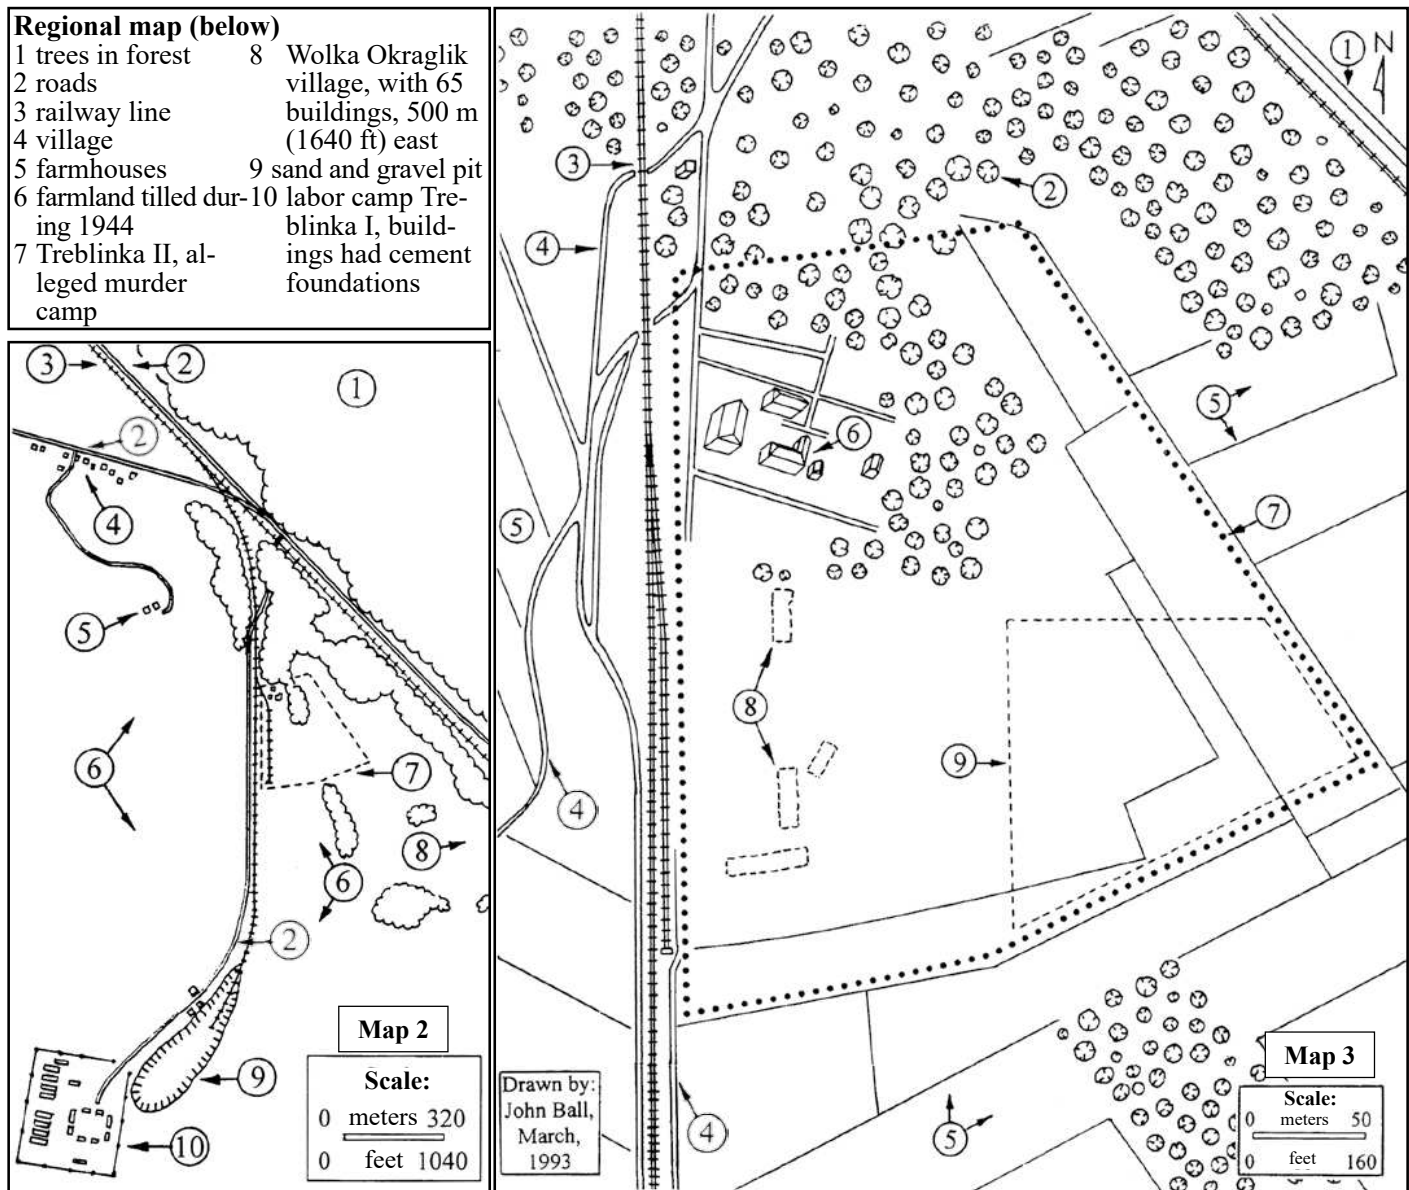

Photo 7 – Before 1960:

This photo shows the gravel-pit railroad line and the type of flat open countryside separated by small groups of trees that occur throughout the area. (Ref.: Miroslaw Dragan, Polish Historical Society, Stamford, CT – Treblinka File.)

Chapter 6

Schematic drawings of the Treblinka II Camp and surroundings

Treblinka II map (right)

- 1 road and rail to Treblinka station 3 km northwest
- 2 trees
- 3 branch rail line south to labor camp Treblinka I
- 4 roads
- 5 farmland that were ploughed and tilled during 1944; 1940 air photos show farming occurred at this time as well
- 6 five buildings without fences during May 1944 were destroyed between May and Sept. 1944, so that only the walls remained (Soviets entered the area in August 1944)
- 7 boundaries of Treblinka II, alleged murder camp

- 8 scars in ground vegetation in 1944 photos that could have been caused by buildings without cement foundations that had been demolished
- 9 location on some eyewitness maps that show cement gas chambers, graves and cremation grills. However, 1944 air photos show no evidence of previous buildings, graves, or scorched earth. It is alleged that cement foundations were removed, however, cement foundation floors of all buildings at the Treblinka I labor camp were not removed and existed in 1993. Assuming the possible packing density (max. 5/m³), only a small fraction of 870,000 could have been buried here (see caption to Photo 10 farther down).

Maps drawn from May to November 1944 air photos as reproduced here.

Chapter 6

Change in boundaries between trees and farms shows the alleged camp area...

Photo 8 – May 25, 1940: This is the only pre-1944 air photo of the alleged Treblinka camp area which has been found up to this time. The July 1942 to September 1943 camp was located to the right of the torn corner at the bottom of the photo. By comparing the railway lines, roads, and boundaries between groups of trees and farmland with the photo on the next page we can state:

- (a) The gravel-pit railway line and other rail lines and roads were installed before 1940.
- (b) Groups of trees in the central and northern third of the camp area were removed after 1940.
- (c) The five houses in the 1944 photos were either not yet built or were completely surrounded by trees in 1940.
- (d) The farms have visible lines, which indicates they were being worked.

Chapter 6

...was as visible from surrounding roads, farmland, and villages in 1940 as in 1944.

Photo 9 – May 15, 1944:

The 1940 and 1944 photos have been enlarged to the same scale and reveal the following:

Small groups of trees in the northern third of the camp area were cut. The five buildings were most likely constructed after 1940. The farming areas to the east towards Wolka Okraglik village and to the west remained *unchanged* from 1940 to 1944. This means the camp area was as *visible* from the surrounding roads, farmland, and villages in 1940 as it was in 1944.

Chapter 6

May 1944 photo shows large parts of the former camp's area denuded of vegetation...

five buildings next to entrance road appear intact

mass-grave area described by eyewitness survivors

Photo 10 – May 15, 1944:

According to maps and descriptions of some survivors, the mass graves were dug in an area of about 90 by 70 meters (300 by 225 feet) in the southeast corner of the camp. However, based on a grave depth of 5 m (as claimed) filled with bodies 4 m deep (covered with a top layer of soil 1 m thick), this area could have held only between 50,000 (at 2/m³) and 125,000 (at 5/m³) bodies. To bury 870,000, the area needed would have been 7 to 17 times larger, covering an area almost as big as, or even bigger than, the entire camp. Taking into account space needed between individual mass graves for work crews to move about and for storing excavated soil, the real area needed would exceed the camp's size under any circumstance.

Chapter 6

...while November photo shows no building foundations as at Malkinia Camp

Photo 11 – November 1944:

Three buildings are destroyed and two are missing roofs. Within the camp area there is no visible evidence of previous cement ‘gas chamber’ foundations or of other foundations, of of a narrow-gauge rail line, as would be expected if the eyewitness accounts were true. This contrasts to the visible foundations of destroyed buildings at the Malkinia and gravel-pit camp (Treblinka I). There is growth of what appears to be dark grass, moss, or other vegetation on the ground which would not occur for years if there had been large continuously burning fires which would have destroyed the organic material in the soil.

Chapter 6

Dismantling Malkinia Camp, and Bug River bridge destroyed

Photo 12 – May 15, 1944: (above)

The vertical road goes through the camp on the right side of the photo. All buildings appear undamaged. The camp could still be occupied. There are a ditch and probably a fence but no watchtowers. There are 55 buildings left of the road and 11 buildings right of the road. The Malkinia Camp was built after 1940, as the May 25th, 1940, photo shows only farmland.

Photo 13 – Fall 1944:

In the camp 26 buildings have been demolished and 29 remain. The foundations of the demolished buildings are visible.

Scale: 2 centimeters = 170 meters, or 1 inch = 700 feet

Photo 14 – May 15, 1944, and Photo 15 – Fall 1944: (top)
Bridge over Bug river was not destroyed until after May 15th, 1944.

Chapter 6

Dismantling of Treblinka I Camp proceeds slowly like Malkinia Camp dismantling

Photo 16 – May 15, 1944:

All buildings are intact in the gravel-pit camp Treblinka I. Objects appear to be piled at the south end of the camp close to the surrounding ditch, and the circle in the central garden has been trimmed. The camp appears to be inhabited, but it is impossible to determine whether it was in operation at this time.

Photo 17 – September 2, 1944:

Five buildings appear to have been dismantled or destroyed, the supplies are no longer visible, and the garden is unattended.

Chapter 6

The Treblinka Camp accusations versus what the air photos reveal

Allegations by witnesses:	What 1940 and 1944 air photos reveal:
In 1942 and early 1943 some 870,000 people were killed and buried in mass graves in the southeast corner of the Treblinka Camp. This area measured some 90 m × 70 m (300 ft × 230 ft). Assuming that half of the area was used for mass graves filled 4 m deep (13 ft), the rest for excavated soil and work area, the graves would have had a volume of some 12,500 m ³ .	Using the Hamburg and Katyn examples of up to 2 bodies per m ³ , and a filled depth of 4 m, only 25,000 corpses could have been buried in this area, or only some 3% of the 870,000 bodies that are alleged to have been buried. The area needed to bury 870,000 would have been some 220,000 m ² , or 470 m × 470 m (1540 ft × 1540 ft) or an area some 35 times larger than the area claimed.
Between July 1942 and February 1943 about 870,000 people, or 3,500 per day, were exterminated in first 3, then 13 gas chambers, and subsequently buried in huge mass graves.	An unobstructed view 300 meters (1000 feet) across farmland from the Wolka Okraglik village and the main rail line, and 5 meters (16 feet) from the gravel-pit road and rail line would have allowed everyone in the area to see and hear the executions.
During 120 days in 1943, about 870,000 bodies, or 7,250 per day, were dug up and burned day and night on huge pyres fueled by wood.	Large fires would have attracted attention from local villagers and spies working in the area. There is no evidence of ground disturbance caused first by the burial of 870,000 corpses, then by large amounts of bones and ash from their cremation, and there is no ground scarring from large fires.
In September 1943 the buildings, fences, and watchtowers were removed.	There is no evidence of building foundations such as those at Malkinia camp and the gravel-pit camp (Treblinka I). The May 1944 photos show no soil disturbance where the cement 'gas chamber' foundations could have been.
The area was made to look like a farm.	The area looks like a farm in which the five farmhouses were either dismantled or destroyed between May and September 1944, and the former camp area was not worked as farmland in 1944.
A large extermination camp operated at this location from mid-1942 to late 1943 in which 870,000 people were murdered, buried, dug up, and then burned on large open fires.	There is no evidence to suggest any more buildings than the five houses in the May 1944 photo existed at this location between July 1942 and September 1943, and there is no evidence of mass burials and burnings. The alleged executions, burials, and burnings would have been visible across farmland to hundreds of local villagers for 14 months straight. There is therefore no evidence that an extermination camp was located here.

Chapter 6

Comparing the Katyn murder site to the alleged Treblinka murder site

Katyn:	Treblinka:
	
4,400 shot and buried in 5 weeks from April 3 to May 11, 1940 = 120 per day	allegedly 870,000 gassed and buried in 8 months from July 1942 to February 1943 = 3,500 per day
4,100 bodies dug up in 2 months from March 29 to June 7, 1943 = 60 per day	alleged 870,000 dug up and burned on large fires within 120 days = 7,250 per day
in the center of a forest of 1 km ² (2/5 square mile) beside a narrow road and far from any houses	surrounded by active farms with no trees and next to a road and railway leading to an active labor camp
no witnesses, as no one was allowed entry into the isolated forest with 1 windy road	thousands of witnesses from open fields, a village 1 kilometer (5/8 mile) away, nearby roads and rail lines
1940 and 1942 photos show no change in boundaries between the forest and cleared areas	1940 and 1944 photos show only little change of tree groves, and unchanged fields around the freely accessible camp area
4,100 bodies buried in graves totalling 96 meters (315 feet) long and 7 meters (23 feet) wide, at 2 corpses per m ³	allegedly 870,000 buried in 90 m × 70 m (300 ft × 230 ft) area, but it would have taken an area 35 times larger than that
local villagers and spies didn't witness the killings, so no reports were sent out of the area	local villagers and spies would have witnessed gassings and cremations during 1942 and 1943 and sent out reports

Photo 19

Chapter 7

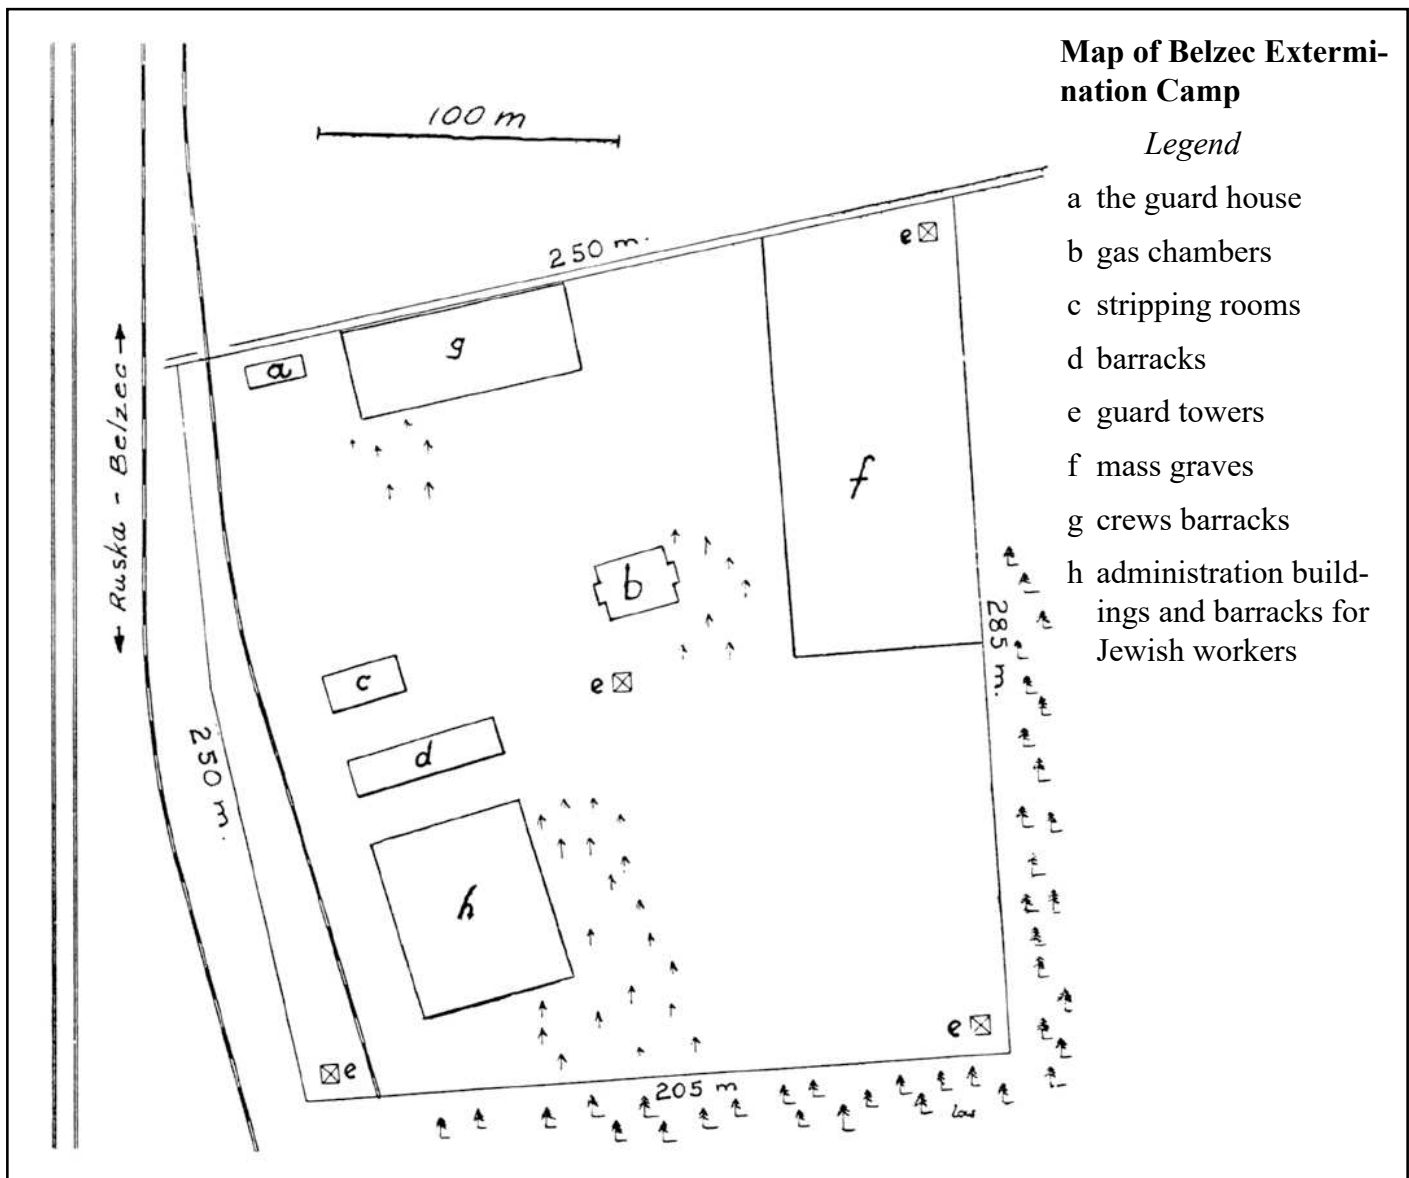

600,000 Allegedly Gassed and Cremated in the Belzec Camp

Belzec was established in the summer of 1940 as a labor camp on the north-south rail line on a side rail spur south of Belzec town. From March to December 1942 about 600,000 Jews were gassed and buried in the Belzec camp grounds.

From November 1942 to March 1943 the 600,000 bodies were dug up and burned on large pyres built on railroad tracks. Ashes and bones were buried in

ditches. After May 1943, the camp was dismantled and pine trees were planted to cover the previous mass graves. (Ref.: Arad, Y., pages 126f., and Gutman, I.)

In 1945 the Polish government measured the camp area and the resulting map accompanied a report describing the mass exterminations (Ref.: Szrojt, E.).*

Map 1 – 1945: The map commissioned by the Polish government to accompany their mass-extermi-
nation report. (Ref.: based on map in Szrojt, E., unpaginated insert.)

* Similar to Treblinka, claims about the number of victims, the murder weapons used, the way the corpses were disposed of, and the time sequence and duration of the events are contradictory. For a critical analysis of the various claims in combination with the evaluation of other evidence see Mattogno, *Belzec*.

Chapter 7

Top of the ridge that parallels the railroad track going to Lysa Mountain just below the photo.

Photo 1 – May 26, 1940: The railroad line which runs from bottom right to top left of the photo passes Belzec railroad station in the middle and Belzec town in the upper left of the picture.

Chapter 7

railroad side spur installed before 1940

main railroad line running south from Tomaszow

Photo 2 – May 26, 1940: On the cross section along the line from A to B – see drawing below – the ridge is 35 meters (115 feet) above the valley floor.

Chapter 7

1940 to 1944 activities on hillside were visible from roads, houses, and the railroad below

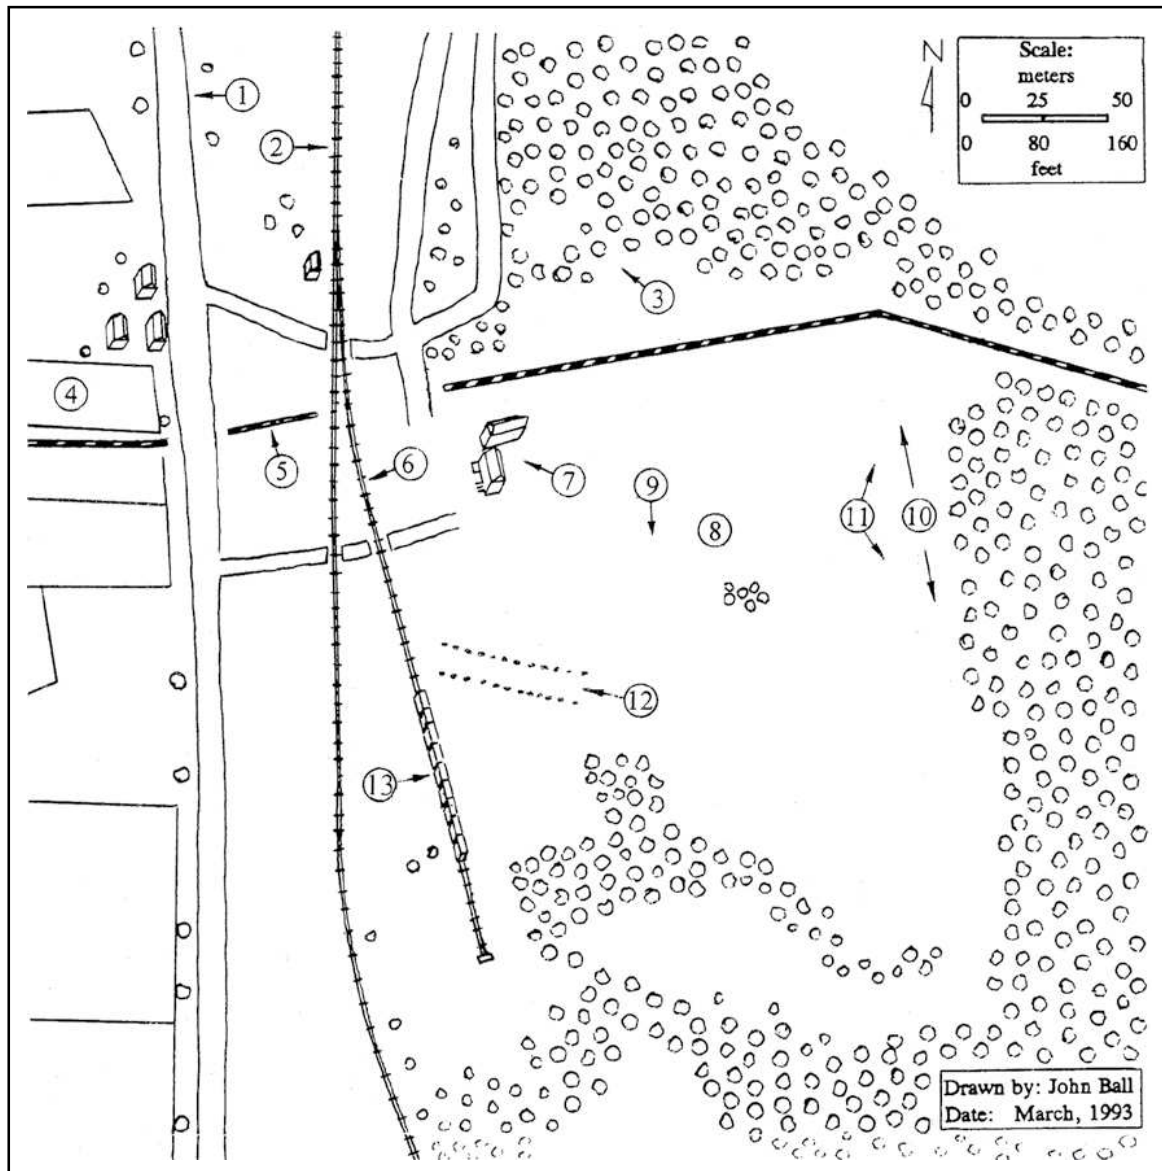

Photo 3 – 1944: Almost all the trees were cut and removed from the cleared area on the hillside, which would have left tree stumps and roots throughout the thin topsoil. Two buildings remained in 1944.

Chapter 7

Schematic drawing of the Belzec Camp area

- | | |
|--|---|
| <p>1 roads</p> <p>2 main rail line passed through Belzec train station one kilometer ($\frac{5}{8}$ mile) north</p> <p>3 trees</p> <p>4 farms that were ploughed and tilled in 1944</p> <p>5 cleared line may have been a power cable</p> <p>6 short railway spur</p> <p>7 the lower building appears to have been a sawmill</p> <p>8 the camp area between the ridge top and the railway spur of 240 m \times 250 m (790 ft \times 820 ft) was cleared by logging of all trees between 1940 and 1944.</p> <p>9 site of the supposed 1942 homicidal gas chambers</p> <p>10 hill-top ridge 30 m (100 ft) higher in elevation than the railway spur in the valley</p> | <p>11 location shown on alleged survivor's maps where 600,000 bodies were buried; it would have been cumbersome to transport the bodies uphill from the supposed gas chambers</p> <p>12 heavily worn path in the soil appears to have been a skid for sliding logs downhill to the rail cars</p> <p>13 rail cars</p> <p>Similarity between the Sobibor and Belzec Camp:
Both camps were erected in a forested area. In 1944, both camp areas had been almost completely cleared of trees. This required intensive logging activities, pointing to the fact that both camps also served as logging camps.</p> |

Chapter 7

The alleged mass graves would have been near the top of the hillside...

Photo 4 – May 26, 1940: The alleged mass-gravesite as drawn in maps by survivors is supposed to have been near the top of the ridge 200 meters uphill from the railroad spur. The valley bottom would contain thick amounts of earth and silt, but the hillside would contain relatively thin topsoil, and together with the tree stumps and roots caused by logging, it would have been very difficult to dig deep mass graves.

Chapter 7

...a difficult location to dig mass graves because of the thin topsoil

alleged location of mass graves for 600,000 corpses —

Photo 5 – May 16, 1944: The size of the area where mass graves are said to have been located is 120 m × 55 m (390 ft × 180 ft). Using the Katyn and Hamburg mass-grave examples with a packing density of some 2 bodies per m³, and a filled depth of 4 m, and assuming that half the area was used for graves, the rest for depositing soil and as work space, then this area could have held some 26,400 corpses or 1/23rd of the alleged 600,000.

Air photos reveal that the Belzec Camp was located on a hillside whose trees were cut and removed from the train tracks to the top of the ridge from 1940 to 1944. Villagers and passing travellers had an unobstructed view of the activities on the hill. In 1944, two buildings remained on the clearing.

Chapter 8

250,000 Allegedly Gassed and Cremated in the Sobibor Camp

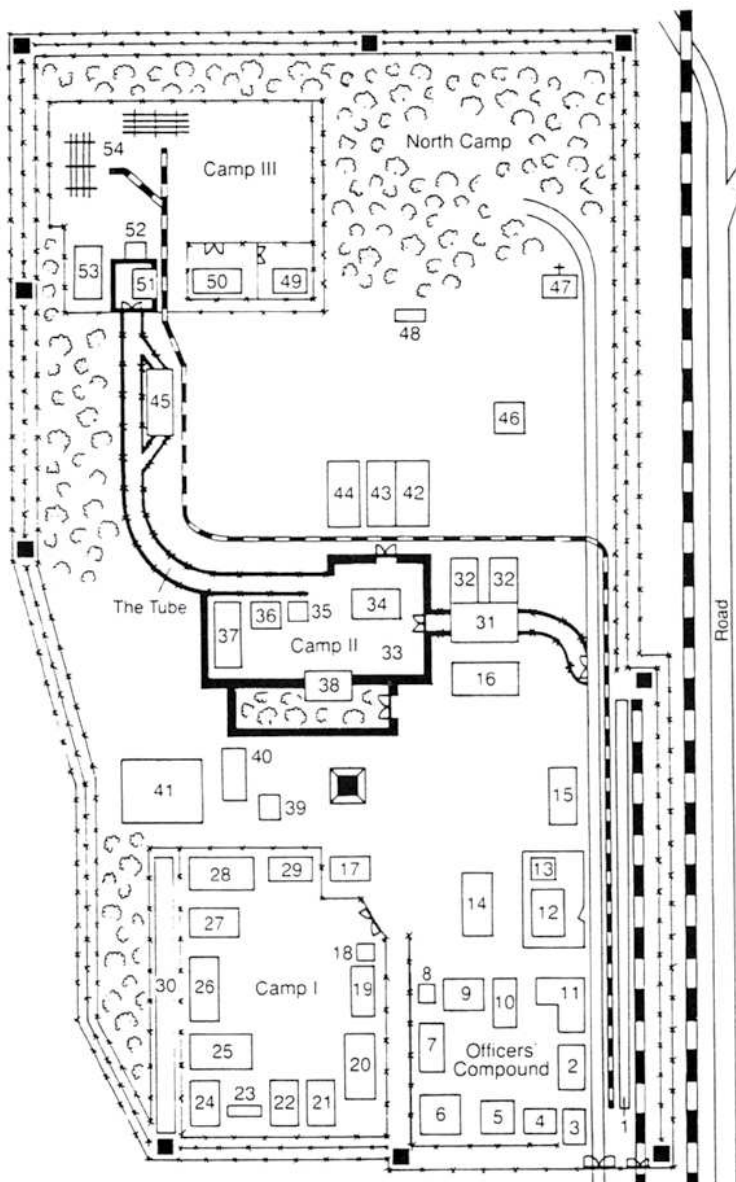

Sobibor was established as a labor camp on a main railway line in late 1941.

Up to the end of 1942, 100,000 Jews were killed and buried in mass graves 60 meters (200 feet) long, 15 meters (50 feet) wide and 6 meters (20 feet) deep in a cleared area in the northwest corner of the camp.

At the end of 1942 the bodies were exhumed and cremated on gigantic pyres. From January to July

1943 a narrow-gauge railway transported Jewish prisoners from the main railway station to the northwest corner of the camp where 150,000 of them were gassed and cremated. (Ref.: Arad, Y., pages 128-130)

At the end of 1943 the camp area was demolished and plowed under before pine trees were planted and a farm was established to make it appear as if a camp has never been there. (Ref.: Gutman, I., pages 1374-1378)*

Map of the Sobibor Camp

Legend:

1. Dentist office for SS
7. Laundry for SS
17. Bakery
19. Tailor shop
27. Prisoner's kitchen
29. Shoemaker shop
37. Stables and barns
39. Ironing room
41. Garden
43. Barracks for sorting clothes
45. Women's barber
46. Incinerator
47. Hospital (the former chapel)

Extermination area:

49. Barracks for camp III worker Jews
50. Kitchen and dentist workshop
51. Gas chambers
52. Engine room for the gas chambers
54. Outdoor crematoria (pyres)

- ⊠ Watchtower

- Barbed wire fence

Map 1: As remembered by survivor Thomas Blatt. (Ref.: Rashke, R. *Escape from Sobibor*, 1982)

* Similar to Treblinka and Belzec, claims about the number of victims, the murder weapons used, the way the corpses were disposed of, and the time sequence and duration of the events are contradictory. For a critical analysis of the various claims in combination with the evaluation of other evidence see Graf/Kues/Mattogno, *Sobibor*.

Chapter 8

The Sobibor railway station on a 1940 photo

Sobibor railway station was on the straight north-south railway line

Photo 1 – July 11, 1940:

In 1940 the Sobibor railway station was on the main north-south rail line in eastern Poland, and the meandering Bug River, on the right side of the photo, was the border between the German area of influence and the Soviet zone of influence in former Poland. The station was surrounded by forests, logging access roads and some farms.

Chapter 8

1940 photo shows lumber mill, tarworks, a church and forests

Photo 2 – July 11, 1940: The locations of the lumber mill, tarworks, and church are on a U.S. Army map which was drawn using 1940 air photo coverage. The lumber mill consists of three small buildings and a larger one. The tarworks are not releasing smoke. The church does not appear to have a spire. Forests surround Sobibor railway station. (U.S. Army map series M 751, sheet 3620)

Chapter 8

In 1944 the one logged area shows no building foundation or rail scars

Photo 3 – May 30, 1944:

The previous lumber-mill area now has 14 buildings. The recently logged section in the upper left of the photo measures 170 m × 130 m and has what appears to be four large buildings. Recent cutting of lines through the forest is evident. There is no ground disturbance or scarring caused by large fires, building foundations, or a narrow-gauge railway line.

Air photos reveal around Sobibor railway station that there was a sawmill, tarworks, a church, and houses, and between 1940 and 1944 one small extension was cleared of logs, but there was no disturbance of soil as would have been caused by buildings, a rail spur, mass burials, and large cremation fires.

Chapter 9

Majdanek – Allegedly 80,000 People Executed and Cremated

Majdanek was established in July 1941 on flat farmland in the suburbs of Lublin three kilometers (2 miles) from the center of town (population over 50,000) and one kilometer ($\frac{5}{8}$ of a mile) from Kosminok (population over 8,000) on the main highway from Lublin to Chełm.

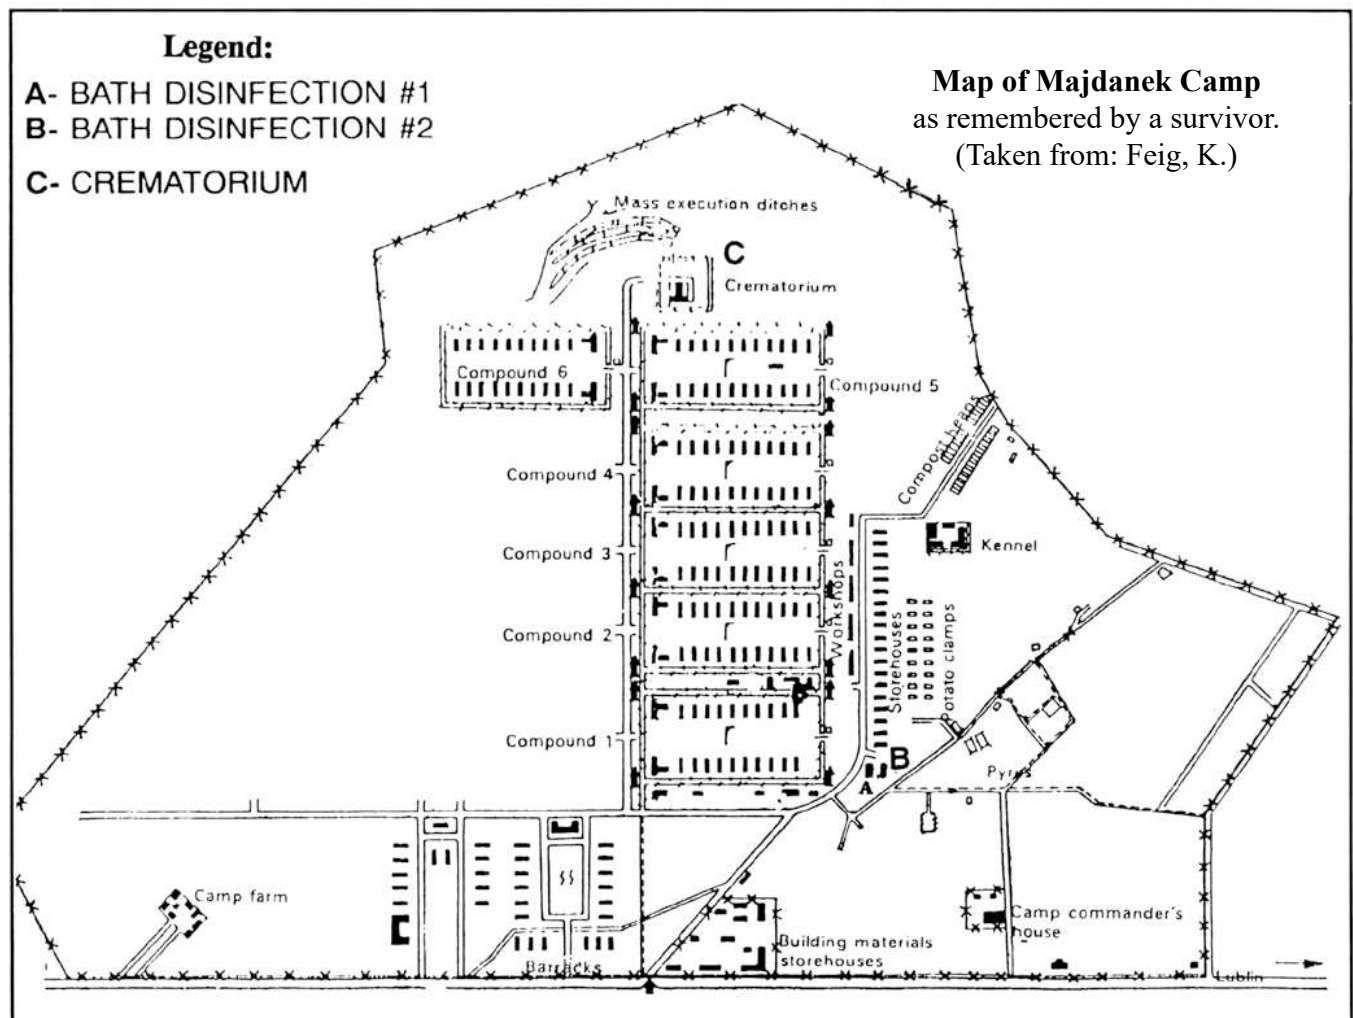

Initially there was a small crematorium in the area separating Compound 1 from Compound 2, as well as allegedly seven gas chambers and two wooden gallows. In September 1943 a larger crematorium with five furnaces was built.

From 1942 to 1944 about 140,000 prisoners, including 80,000 Jews, were executed by firing squad or were gassed to death using Zyklon B or carbon monoxide.

Before the Soviet army arrived in July 1944, the Germans burned some buildings including the large crematorium but failed to destroy the alleged homicidal gas chambers. The crematorium was rebuilt after the war from plans of the original structure with a chimney that is 11 meters (36 feet) tall.

(Ref.: Gutman, I., pp. 937-940)

The Majdanek narrative has changed drastically over the decades. Right after the war, the Soviets claimed that this camp's death toll was as high as two million, killed mainly in seven gas chambers. After many downward revisions over the decades, the Majdanek museum's research director Tomasz Kranz published a paper in 2005 in which he reduced the camp's death toll to 78,000 while maintaining only two of the initial seven gas chambers. Zyklon B is no longer claimed to have been used as a murder weapon.*

* For details see Graf/Mattogno, *Majdanek*; and the documentary by Hunt, *The Majdanek Gas Chamber Myth*.

Chapter 9

Photo 1 – September 18, 1944:

Hundreds of houses in the Lublin suburbs surrounded Majdanek, and a large church was located 800 meters (half a mile) away. People in the approximately 100 houses along the left side of the camp were only 200 to 500 meters (660 to 1600 feet) away across farmland and would have had an unobstructed view of everything occurring in the camp.

Photo 2 – Sept. 18, 1944: The only two homicidal gas chambers claimed today, allegedly operated with carbon monoxide, are said to have been in the sanitation facility close to the “Bath & Disinfection I” building. In the above photo it is located beneath a large pole-support roof which was used to air out clothes and linens disinfested with Zyklon B. This roof does no longer exist, and the map on p. 149 does not show it either. These buildings were located outside the inner camp area secured with watchtowers and bared-wire fence, and 200 meters (660 feet) across farmland from the Lublin-to-Chelm highway. The new crematorium was also outside the inner camp area, and 200 meters (660 feet) across farmland from hundreds of houses.

Chapter 9

Alleged gas chambers standing alone outside of camp's main fence

Photo 3 – September 18, 1944: Beneath the large pole-support roof (arrow) is located a small concrete building which housed three disinfestation chambers (see Photo 3 on p. 116). The two buildings extending from it are the “Bath & Disinfection” buildings I and II housing inmate showers, one for males, one for females. One of them also had a make-shift Zyklon B delousing chamber. For some time after the war it was claimed that this was a homicidal gas chamber, but not anymore. The top building extension (Bath & Disinfection I) has one chimney, and the bottom one has two chimneys. The buildings are outside the inner camp area on the access road leading into the camp.

Top: The hygiene buildings “Bath and Disinfection” I and II were 40.76 m long (roughly 134 ft); the pole-support roof (arrow) was 62 m long (roughly 197 ft) (Ref.: Graf/Mattogno, *Majdanek*, Docs 30f.)

Photo 4 – September 18, 1944:

The edge of the inner camp area including its fence are along the top of this photo section. The new Majdanek crematorium is directly in the middle. It is a relatively small building with an 11-m (36-ft)-high chimney. When the Soviets wrote an investigation report of this facility in Aug. 1944, they reported that all wooden parts of the building had burned away. This photo shows an uneven roof structure, probably caused by the fire. In the lower right corner four ditches can be seen, which are said to have served for the execution by machine-gun fire of some 18,000 Jews in November 1943 (current official version).

burned-down

were allegedly gunned down

Chapter 10

Babi Yar Mass Executions, Exhumation, Cremations – 1941/43

In 1941 the Babi Yar Ravines were a series of dried-up stream drainage channels that once drained into the Dnieper River in northwest Kiev in the Ukraine region of the former Soviet Union. The upper channels had flat bottoms.

It is alleged that in 1941 on September 28th and 29th, 33,771 Jews from Kiev gathered as ordered at a location where the Jewish cemetery meets Babi Yar Ravine. There they were marched in small groups to the edge of the ravine and were killed

with machine guns by Waffen-SS soldiers. The corpses were covered with soil.

In 1943, from August 18th to late September, 327 workers lived in the ravine while digging up the corpses of the victims and burning them on pyres built on railroad tracks doused with gasoline.

During the 1970's, fill was plowed into the ravine, and today there are no photos or other evidence of the crimes other than eyewitness accounts.

(Ref.: Gutman, I., page 113-115)

Photo 1a: Photo of the Babi Yar dried-up stream channel taken by the Soviet Extraordinary State Commission “investigating” (alleged) German war crimes in 1943. The victims allegedly fell into the ravine after having been shot and were then covered with soil. Two years later, they were allegedly dug up and burned. It is not known if any roads went down the steep walls to the flat bottom.

Photo 1b: Color photograph by Johannes Hähle, a military photographer with the German *Propaganda-Kompanie* 637 of the 6th Army. deathcamps.org claims: “When Hähle came to Babi Yar, he entered the ravine and was overwhelmed by the huge quantities of belongings of the murdered Jews. He seized the opportunity and took some photos of the possessions of the victims.” – Littered belongings do not prove that their (former) owners were murdered, though.

Photo 1c: Color photograph by Johannes Hähle, as above. deathcamps.org claims: “In October 1941 about 300 [Soviet] POWs were taken to the ravine to bury the bodies. In the photo they level the earth over the mass graves. The German soldier (foreground) is showing Ukrainian women the workers in the ravine.” – If true, the Germans thus created hundreds of witnesses.

(Ref. Photos 1a-c, 3a-c: *The Babi Yar Album*, <http://www.deathcamps.org/occupation/byalbum>)

Chapter 10

The extended Babi-Yar system of erosion channels surrounded by a white ellipse—

Christian cemeteries—

Jewish cemetery—

Photo 2 – September 26th, 1943:

This photo was taken when the supposed mass excavations with subsequent cremations in the ravine, which are said to have started around August 20, 1943, were just coming to an end. If 33,771 corpses were exhumed and burned on huge pyres (or even more, if more people were executed after September 1941, as is claimed*), evidence of still smoking pyres, of massive soil movements, of vehicle and foot traffic to supply fuel should be evident in the area where the mass graves are said to have been located: in the ravine branches west of the Christian and Jewish cemeteries.

* On the numerous conflicting claims about the alleged mass murder at Babi Yar see Tiedemann as well as Mattogno, *The Einsatzgruppen*.

Chapter 10

Photo 3a: deathcamps.org claims: *“In the photo the POWs level the earth over the mass graves, guarded by German soldiers (foreground and upper left).”* If huge numbers of corpses were located just beneath the surface, it would be very wavy and uneven. However, the bottom of this ravine is perfectly flat and unperturbed. In addition, most of the digging is happening where the slopes of the ravine meet the floor. If more than 30,000 corpses were scattered here, they would be everywhere. In other words: something else entirely is going on here.

Orthodox historians claim that, after the initial 33,771 Jews from Kiev had been killed here, several tens of thousands more Jews were murdered, ultimately totalling some 100,000 victims. Both the first batch of victims as well as later batches are

said to have been walked in large columns to the crime scene (see next page). They undressed at the top of the ravine, then were shot either at its edges or after climbing into it. Note that Photo 1b shows clothes at the bottom of the ravine, though.

Photo 3c&d: deathcamps.org claims: *“This photo was taken at the corner of Kerosinnaja and Lageraja Streets, near the ‘Zenit’ Stadium. Ukrainian women (in all probability) tried to learn about the fate of their relatives, who possibly resided in nearby barracks.”* Although German military photographer Johannes Hähle took photos of large gatherings of people, Jews lining up by the tens of thousands were not among them.

Note that in this photo the exclusively female individuals are all smiling, which is rather unusual for people who are looking for information about missing relatives. All captions added to these photos by deathcamps.org are entirely conjectural and evidently directed at trying to prove the usual atrocity claims. The actual contents of the photos, however, quite frequently tell a rather different story.

Chapter 10

Section enlargement of Photo 2: The area of Babi Yar where murders allegedly happened

Slightly lighter discoloration which could be brighter soil, dust or smoke – in the wrong area, though —

Photo 4 – September 26th, 1943: Orthodox historiography currently assumes that the first batch of 33,771 Jews killed in September 1941 were buried and later exhumed and cremated in the ravine section encircled with a dotted ellipse. Later on, several more batches of up to almost 100,000 more victims are said to have been driven into the ravine following a path indicated by the white arrows, leading to their mass burial and later exhumation and cremation in that area of the ravine (cf. Kruglov).

1943 air photos of Babi Yar Ravine reveal that neither the soil nor the vegetation is disturbed as would be expected on a massive scale, if mass graves for 33,771 or even up to – and more than – 100,000 victims had recently been excavated and pyres were burning up to that date, and if materials and many thousands of metric tons of fuel wood had been transported to the site.

Chapter 11 – Conclusions

The Hamburg Holocaust and the Bergen-Belsen typhus epidemic

Summaries:

1. For 10 days from July 24th to August 2nd, 1943, bombing destroyed large areas of Hamburg and killed about 100,000 people.
2. Buildings in many areas were completely burned out with only the walls left standing.
3. 40,000 bodies were buried in four graves each measuring 130 m × 16 m (426 ft × 52 ft), which can be viewed in the cemetery today.

1. Hamburg

Conclusions:

After the firestorm, rubble-filled building ruins, and scars from burning were visible in air photos.

The mass burial, trenches for 40,000 victims, if placed end to end, would have measured 520 meters long and 16 meters wide with large piles of dirt 10 meters wide on both sides of the graves.

Summaries:

1. When the British entered the camp on April 15th, 1945, thousands of dead and dying typhus victims lay in the yards and barracks.
2. At least five mass graves each from 15 to 20 meters (50 to 66 feet) long and holding thousands of bodies were dug in one area.
3. The British burned 80% of the wooden barracks in the camp in May 1945, and building foundation scars are visible in the August 1945 air photos.

2. Bergen-Belsen

Conclusions:

During April 1945, when vehicles and workers were digging the mass graves and pushing earth fill on top of them, they left behind mounds of excess soil and vehicle tracks that are visible in the August air photos four months later.

The building foundations of the burned barracks are also visible in the August photos.

Chapter 11

The Katyn Forest and the Auschwitz farmland

Summaries:

1. In September 1942 the narrow winding road passed by the cleared gravesite, and the forest boundaries remained the same as 1940.
2. Placed end to end, the mass graves measured 96 by 6 meters (315 by 20 feet) and held 4,100 bodies.
3. Before August 1943 the Germans had reburied the 4,100 in 7 mass graves.

3. The Katyn Forest

Conclusions:

To ensure that no one would witness the 1940 execution of 4,400 prisoners, the Soviet police moved the men by windowless trucks to the center of a fenced-in forest of one square kilometer (2/5 of a square mile) and executed them. The mass graves, if joined end to end, would have measured 96 by 6 meters (315 by 20 feet).

Summaries:

1. For at least 3 kilometers (1¼ mile) outside the camp fences and adjacent guard towers there were no visible gates, gatehouses, or watchtowers.
2. All four crematoria at Birkenau were fully visible to spies and the general public from outside the camp at least until end of May 1944. No air photo shows smoke from their chimneys, coke piles, or fuel-delivery systems.
3. Two 1944 air-photo dates reveal no smoke from outdoor fires. Four other 1944 air-photo dates show smoke rising from a small area north of Crematorium V.

4. The Auschwitz Farmland

Conclusions:

If mass executions were occurring at the Birkenau crematoria, spies and the general public would have reported them, air-photo interpreters would have detected them, and the Birkenau crematoria would have been bombed. Instead we see four crematoria visible from outside the camp designed to burn only a limited number of corpses per day with no smoke rising from chimneys, no coke piles or fuel-delivery systems. Smoke rising from a small outdoor fire is incompatible with witness claims of gigantic pyres.

Chapter 11

The Treblinka and Belzec Camps

Summaries:

1. From 1940 to 1944 the camp was surrounded by farms, roads and hundreds of villagers who would have witnessed exterminations.
2. Burying the alleged 870,000 victims would have required an area of some 220,000 m² (470 m × 470 m or 1540 ft × 1540 ft), an area 35 times larger than the described 90 m × 70 m (300 ft × 230 ft) gravesite area.
3. The 1944 photos show no evidence of previous fences, railways, or more than five buildings.

Summaries:

1. From 1940 to 1944 people present in the valley or passing through had an unobstructed view of the hillside camp and would have witnessed any mass murders.
2. To bury the alleged 600,000 corpses would have used an area 390 m × 390 m (1280 ft × 1280 ft) or 23 times larger than the 120 m × 55 m (390 ft × 180 ft) described mass-grave area.
3. In 1944 two buildings were on the area that had been cleared of trees between 1940 and 1944.

5. Treblinka II

Conclusions:

In May 1944, the former Treblinka II camp consisted of 5 buildings on open farmland surrounded by roads and villages in which nothing unnatural could have occurred without thousands of people including spies knowing about it. No soil disturbance from previous camp structures is visible. Only 1/35th of the alleged amount of bodies could have been buried in the claimed 90 m × 70 m mass-grave area.

6. Belzec

Conclusions:

The Belzec Camp was located on a hillside leading up to a ridge which had a thick stand of trees that were cut and removed between 1940 and May 1944, after which two buildings remained in one corner of the clearing. In the 1944 air photos there is no evidence of previous building foundations or mass cremations, and they therefore reveal the alleged gigantic murder activities did not happen at this camp.

Chapter 11

The Sobibor and Majdanek Camps

Summaries:

1. From 1940 to 1944 the Sobibor train station area held a sawmill, tarworks, a church, and other buildings.
2. An area alleged to have been the mass-gravesite is the small northern extension cleared of trees between 1940 and 1944.
3. There is no evidence of ground disturbance caused by buildings, burials, a narrow-gauge railway, or cremations on any of the cleared areas between 1940 and 1944.

7. Sobibor

Conclusions:

The Sobibor Camp was located at a railway station and near a sawmill. A small northern extension was cleared of trees between 1940 and 1944; there is no evidence in the 1944 photos of soil disturbance from building foundations, mass graves, a narrow-gauge railroad line, or mass cremations. The alleged gigantic murder activities did not happen at this camp.

Summaries:

1. Majdanek detention camp was surrounded by main roads, churches and hundreds of houses in the Lublin suburbs.
2. The alleged gas chambers were outside the inner camp area and 200 meters (660 feet) across farmland from a main highway.
3. The crematorium was also outside the inner camp area, 300 meters (1,000 feet) across farmland from hundreds of houses.

8. Majdanek

Conclusions:

Any unnatural sights or sounds which occurred outside the Majdanek camp fence at the alleged gas chamber or crematorium would have been detected by the thousands of townspeople and spies who lived around the camp in the Lublin suburbs. Visible mass executions and unusual cremations almost certainly did not occur at Majdanek.

Chapter 11

Final Conclusions

				
	<table><tr><td><p>Katyn</p><p>No one witnessed the forest murders. The graves held 4,100 and measured 96 m × 6 m (310 ft × 20 ft).</p></td><td><p>Hamburg</p><p>The mass graves for 40,000 bombing victims measured 520 m × 16 m (1705 ft × 52 ft).</p></td></tr></table>	<p>Katyn</p> <p>No one witnessed the forest murders. Air Photo Reference Numbers

Reference numbers for copies of air photos acquired from the National Archives Air Photo Library, Alexandria, VA

Listing example: 5.3-4 RG 373 Can F 5367, expo 3183

This refers to: Chapter 5.3, Photo 4, the negative roll no., and Exposure no. 3183

References that start with RG 373 are negative rolls exposed by U.S-American aircraft, while those starting with GX are the prints exposed by the Germans from 1939 to 1945 and now held at the National Archives in Washington, D.C.

Some U.S. air photos did not end up in the U.S. but were left behind in the UK and are now in the UK's National Collection of Aerial Photography, Edinburgh. We have here only one such photo:

Set in Times New Roman

Cover Illustrations: clockwise from upper left: Dr. Robert Faurisson and Fred A. Leuchter study paperwork while doing research at the Dachau Camp for the “Second Leuchter Report”; Fred A. Leuchter and a prison guard at the entry door to the execution gas chamber of the prison at Parchman, Mississippi, while doing research for the “Third Leuchter Report”; a snapshot of Leuchter. Background below: The Auschwitz-Birkenau labor camp, where it was alleged until the late 1980s that as many as 4 million Jews were gassed to death (today some 1 million are still claimed).

Table of Contents

	Page
Introduction	9
The First Leuchter Report.....	13
1. Preface by Prof. Dr. Robert Faurisson	13
2. A Brief History of Critiques of the Leuchter Report.....	20
3. An Engineering Report on the Alleged Execution Gas Chambers at Auschwitz, Birkenau, and Majdanek, Poland.....	24
3.0. Introduction.....	24
3.1. Purpose.....	24
3.2. Background.....	25
3.3. Scope.....	25
3.4. Synopsis and Findings	26
3.5. Method	27
3.6. Use of HCN and Zyklon B as a Fumigant	27
3.7. Design Criteria for a Fumigation Facility	29
3.8. Design Criteria for an Execution Gas Chamber.....	31
3.9. United States Execution Gas Chambers Since 1920.....	32
3.10. Toxic Effects of HCN Gas	34
3.11. A Brief History of the Alleged German Execution Gas Chambers	35
3.12. Design and Procedures at the Alleged Execution Gas Chambers	37
3.13. Crematories	41
3.14. Forensic Considerations of HCN, Cyano-Compounds and Crematories	44
3.15. Auschwitz, Krema I	47
3.16. Birkenau – Kremas II, III, IV and V	50
3.17. Majdanek.....	53
3.18. Statistics	56
3.19. Conclusion	56
3.20. Bibliography.....	58
3.21. Documents	59
4. Critical Remarks.....	90
4.1. Physical, Chemical, and Toxicological Features of HCN and Zyklon B.....	90
4.2. Disinfestation Chambers	98
4.3. Homicidal Gassings	99
4.4. Cremations	107
4.5. Chemical Analysis	111

5. Methodology	229
6. Construction of the Document	229
7. Proofs	230
8. Categories.....	231
9. Review	237

Part One: Delousing Gas Chamber and Other Disinfestation

Installations	237
10. Chapter 1: Foreword on Zyklon B	237
11. Chapter 2: The <i>Stammlager</i> Delousing Installations.....	238
12. Chapter 3: The Prussic Acid Delousing Installation in the Reception Building	238
13. Chapter 4: Kanada and Its Clothing Delousing Installation.....	238
14. Chapter 5: The Delousing and Disinfestation Installations of BW 5a and 5b in <i>KGL Birkenau</i>	239
15. Chapter 6: The Disinfestation Installation of the Gypsy Camp in Sector BIle of Birkenau.....	239
16. Chapter 7: The Birkenau "Zentral Sauna" with its Disinfection Autoclaves and Topf Disinfestation Ovens	239

Part Two: The Extermination Instruments

17. Chapter 1: History of Topf.....	240
18. Chapter 2: <i>Krematorium</i> 1 or the "Old Crematorium" of the Main Camp (<i>Auschwitz Stammlager</i>).....	240
19. Chapters 3 and 4: Bunker 1 or the "Red House" Bunker 2 (V) or the "White House"	241
20. Chapters 5 and 6: <i>Krematorien</i> II and III; The Ventilation Systems of <i>Krematorien</i> II and III	241
21. Chapter 7: <i>Krematorien</i> IV and V. Plans, Construction and General Study.....	242

- 22. Chapter 8: “One Proof...One Single Proof”: Thirty-Nine Criminal Traces.....243
- Part Three: Testimonies.....243
 - 23. Chapters 1, 2, and 3: Critical Examination of the “War Refugee Board”; Critical Examination of the Testimonies of Doctors Bendel and Nyiszli; the Deposition of Henryk Tauber243
- Part Four: Auschwitz and the Revisionists.....244
 - 24. Chapter 1: Auschwitz Explained by the Revisionists244
 - 25. Chapter 2: Auschwitz According to the Revisionists.....244
- Part Five: The Unrealized Future of K.L. Auschwitz-Birkenau.....244
 - 26. Chapter 1: The Aborted Future of the *Stammlager* without Extermination.....244
 - 27. Chapter 2: Birkenau 1945: the Extermination Station244
 - 28. Postface244
 - 29. Conclusion245

Introduction

By Germar Rudolf

The *Leuchter Report*,¹ first published in 1988, is the work of a pioneer. It was the first study that subjected the claim that human beings were killed in masses in homicidal gas chambers during the Third Reich to a forensic investigation. Because Fred Leuchter had only two weeks to prepare his expert report focusing on the Auschwitz and Majdanek camps and because he lacked in-depth knowledge of the historical background, his report could not possibly have the scientific depth the topic deserves. It was therefore to be expected that it would be subject to detailed criticism.

Instead of criticizing the *Leuchter Report*, the author of these lines decided in 1989 to do a better job with the original task. After all, it is always easy to complain, but it is quite difficult to do a better job on a topic so complex and imbued with prejudices and emotions. This improved “Leuchter Report,” my own expert report called *The Rudolf Report*, was first published in German in 1993² and in English ten years later.³ In contrast to the success of the *Leuchter Report*, my own expert report remained something of an insider’s secret resource, probably because it is only second in line and also because dense, in-depth scientific studies covering physical, chemical, toxicological, and engineering questions, as well as detailed historical documentations, are not the kind of publications that attract the masses. They are simply not easy to digest.

Considering the fact that the *Leuchter Report* remains popular, I decided to put it back in print. But since historical research on Auschwitz and Majdanek has made huge progress since 1988 – not least because many archives in eastern Europe became accessible after the collapse of the Soviet Union – it would be irresponsible to simply reprint it. It was therefore decided to publish a commented version of it. The text of the original *Leuchter Report* was left intact, since it also has become a historical document. The reader will find many footnotes throughout the report, however, which were all added by me. They either give references to sources and further explanations that back up Leuchter’s claims, or they correct or comment on Leuchter’s statements where

¹ Fred A. Leuchter, *An Engineering Report on the alleged Execution Gas Chambers at Auschwitz, Birkenau and Majdanek, Poland*, Samisdat Publishers Ltd., Toronto 1988, 195 pp.

² Rüdiger Kammerer, Armin Solms (eds.), *Das Rudolf-Gutachten*, Cromwell, London 1993 (www.vho.org/D/rga).

³ G. Rudolf, *The Rudolf Report*, Theses & Dissertations Press, Chicago 2003; 2nd ed. The Barnes Review, Washington, DC, 2011 (www.holocausthandbooks.com/dl/02-trr.pdf).

necessary. All illustrations embedded in the text section of the report were also added for this edition, so that the reader can visualize the locations, devices and items Leuchter is writing about. At the end of this first *Leuchter Report*, the reader will find several additional chapters, which explain in more detail the issues involved.

What is unknown to many is the fact that Fred A. Leuchter not only authored the famous first *Leuchter Report*, but that he also compiled three more studies on related issues in the years that followed. They were called *The Second*, *Third*, and *Fourth Leuchter Report*.⁴ Since they all belong together, it was decided to include them in this book as well. These later three reports were not given comment in this edition, because most comments that would seem appropriate are already included in the *First Leuchter Report*. As to Leuchter's critique of Jean-Claude Pressac's work on Auschwitz – *The Fourth Leuchter Report* – I direct the reader's attention to more thorough critiques by other revisionists of Pressac's work.⁵

The idea to publish this critical edition of the Leuchter Reports was triggered by the fate of the person on whose behalf they had been compiled: Ernst Zündel. The reader will be introduced to Ernst Zündel's trials and tribulations in the introduction by Robert Faurisson, so I will restrict myself to saying that these four *Leuchter Reports* are the core of Zündel's legacy, for which he is sitting in a German jail as I write these lines, because in Germany doubting the veracity of the official version of the Holocaust is a thought crime punishable with up to five years in prison.

This critical edition is not only dedicated to Ernst Zündel, but also, of course, to the author of the reports whose name they bear, who suffered like no other American because of his historical dissent. After Ernst Zündel had published Leuchter's first report, Jewish organizations launched a vicious smear campaign, which eventually destroyed not only Leuchter's reputation but also his ability to make a living. Leuchter's contracts with state authorities for the manufacture, installation and servicing of execution hardware were cancelled. He was financially forced out of his home in Massachusetts and had to find private work elsewhere.⁶

But who is Fred A. Leuchter anyway? A number of mainstream media reported on Fred Leuchter. Some of their statements were:⁷

A feature article in *The Atlantic Monthly* (Feb. 1990) described Leuchter as "the nation's only commercial supplier of execution equipment. [...] A trained and accomplished engineer, he is versed in all types of execution equipment. He makes lethal-injection machines, gas chambers, and gallows, as well as electrocution systems [...]"

Similarly, a lengthy *New York Times* article (October 13, 1990), complete with a front-page photo of Leuchter, called him

⁷ Taken from the paper "Probing Look at 'Capital Punishment Industry' Affirms Expertise of Auschwitz Investigator Leuchter," *The Journal of Historical Review* 17(2) (1998), pp. 34ff.

“The nation’s leading adviser on capital punishment.”

In his book about America’s capital punishment industry, Stephen Trombley confirms that Leuchter is:⁸

“America’s first and foremost supplier of execution hardware. His products include electric chairs, gas chambers, gallows, and lethal injection machines. He offers design, construction, installation, staff training and maintenance.”

Thus, with Fred A. Leuchter we have the foremost, if not the only expert on execution technology in the U.S. at that time. Should such a person not be competent to judge the technical feasibility of the alleged execution technology applied by the Third Reich? Well, at least he should have the right to voice his opinion, should he not?

According to Fred Leuchter, killing someone in a gas chamber is very dangerous for those who carry out the execution, above all because the body of the dead prisoner is saturated with lethal gas. After the execution, explains Leuchter:⁹

“You go in. The inmate has to be completely washed down with chlorine bleach or with ammonia. The poison exudes right out through his skin. And if you gave the body to an undertaker, you’d kill the undertaker. You’ve got to go in; you’ve got to completely wash the body.”

Bill Armontrout, warden of the Missouri State Penitentiary in Jefferson City, which contains an execution gas chamber, confirms the danger:¹⁰

“One of the things that cyanide gas does, it goes in the pores of your skin. You hose the body down, see. You have to use rubber gloves, and you hose the body down to decontaminate it before you do anything [else].”

In Leuchter’s opinion, gas-chamber use should be discontinued, not just because of the cruelty of this method of execution, but because of his beliefs relating to gas chambers as such:¹¹

“They’re dangerous. They’re dangerous to the people who have to use them, and they’re dangerous for the witnesses. They ought to take all of them and cut them in half with a chain saw and get rid of them.”

With a career built on the motto “Capital punishment, not capital torture,” Leuchter took pride in his work – until the Holocaust lobby saw to it that he lost his calling.

This book is an intellectual memorial to both Ernst Zündel and Fred Leuchter.

The First Leuchter Report

1. Preface by Prof. Dr. Robert Faurisson

Fred A. Leuchter, born in 1942, is an engineer living in Boston, Massachusetts, who specialized in the design of execution hardware used in prisons throughout the United States. One of his major projects was the design of a new gas chamber at the Missouri State Penitentiary at Jefferson City.

In January of 1988 I was in Toronto, Canada, assisting in the defense of Mr. Ernst Zündel, a German-Canadian who was on trial for spreading false news by publishing *Did Six Million Really Die?*,¹² a booklet which challenged the prevailing view that six million Jews were killed by the Nazis during World War II, primarily through the use of gas chambers using hydrocyanic gas (Zyklon B gas).

Ernst Zündel had been previously tried on the same charge in 1985. The trial lasted seven weeks and ended with a conviction and a sentence of fifteen months' imprisonment.¹³ In January 1987, the Ontario Court of Appeal overturned the judgment because of grave errors in law and ordered that a new trial be held. The retrial began on January 18, 1988, and at the time of this writing is still proceeding.

My initial conversations with Fred Leuchter took place in Boston on the 3rd and 4th of February, 1988. I was impressed with the conciseness of his answers to my questions and by his ability to explain every detail of gassing procedures. He confirmed to me the particularly dangerous nature of an execution by hydrocyanic gas.

Executions using this gas were carried out for the first time in the United States in 1924, but as late as 1988 major difficulties still existed in the construction of execution gas chambers, including the problem of leakage. I noticed that Fred Leuchter did not question the standard notion of the Holocaust.

After my return from Boston to Toronto and after I had reported to Ernst Zündel on my discussions with Fred Leuchter, Mr. Zündel decided to ask the latter to prepare an expert opinion on the alleged gas chambers at Auschwitz, Birkenau and Majdanek.

Mr. Leuchter accepted the assignment after a weekend in Toronto reviewing wartime aerial photographs of the camps, plans of the crematoriums and alleged gas chambers, documents on Zyklon B and slides taken of the sites in the 1970's by the Swedish researcher Ditlieb Felderer.

On February 25, 1988, Mr. Leuchter left for Poland together with his wife Carolyn, his draftsman Howard Miller, cinematographer Jürgen Neumann, and Polish-language interpreter Tijudar Rudolph. They returned eight days later on March 3rd.

Upon return, Fred Leuchter wrote his report of 192 pages including appendices. His conclusions were clear: the evidence was overwhelming that there were no execution gas chambers at Auschwitz, Birkenau and Majdanek and that the alleged gas chambers at these sites could not have been, then or now, utilized or seriously considered to function as execution gas chambers.

On the 20th and 21st of April, 1988, he stood in the witness stand in Toronto. At first, he replied to the questions put to him by Mr. Zündel's defense lawyer,¹⁴ Douglas H. Christie, assisted by Keltie Zubko and Barbara Kulaszka. Mr. Leuchter then faced cross-examination by the crown prosecutor, John Pearson, an official who had been assisted throughout the trial by another crown attorney, a law clerk, and frequent consultations with Jewish advisors sitting immediately behind him in the courtroom.

The examination and cross-examination took place in the presence of a judge and an eleven-member jury. In the courtroom, the atmosphere was one of extreme tension. I was sitting beside a number of revisionist experts, including Dr. William Lindsey, chief research chemist for Dupont Corporation before his retirement in 1985. Everyone in the courtroom, regardless of his or her own personal viewpoint on the topic under examination, was acutely aware, I think, of participating in a historical event. The myth of the gas chambers was ending.

The previous day, the director of the Missouri State Penitentiary, Bill Armontrout, had given testimony¹⁵ explaining the procedures and practical operation of a cyanide gas chamber. For every attentive listener it was revealed that if it was so difficult to execute a single person in this manner, then the alleged execution of hundreds of thousands of persons by the Germans using Zyklon B would equal the problem of trying to square the circle.

Following Fred Leuchter on the witness stand was Dr. James Roth, Ph.D. (Cornell Univ.), Manager of Alpha Analytical Laboratories in Ashland, Massachusetts.¹⁶ Dr. Roth reported on the analysis of samples taken from the walls, floors, ceilings and other structures inside the alleged gas chambers of

¹⁴ www.zundelsite.org/archive/english/dsmrd/dsmrd33leuchter.html

¹⁶ www.zundelsite.org/archive/english/dsmrd/dsmrd34roth.html

Auschwitz I and Birkenau. These tests revealed either no detection of traces of cyanide or extremely low levels. The only exception was the control sample number 32 taken from Delousing Facility Number 1 at Birkenau. These results were graphically produced in Appendix I of the Report and displayed to the jury on an overhead projector. The difference in detected cyanide between the delousing facility on one hand and the alleged gas chambers on the other was spectacular. The extremely low level of cyanide found in some crematoria was likely, in my opinion, to have resulted from disinfection of the premises during the war.

I think I was the first to point out that all studies of the alleged German execution gas chambers using Zyklon B should commence with a study of the American execution gas chambers. As early as 1977, with the help of an American friend, Eugene C. Brugger, a lawyer in New York City, I began an inquiry into this area. During this research, I obtained information from six American penitentiaries: San Quentin, California; Jefferson City, Missouri; Santa Fe, New Mexico; Raleigh, North Carolina; Baltimore, Maryland; and Florence, Arizona. I was forced to conclude at that time that only an expert in American gas-chamber technology could finally determine whether the alleged German execution gas chambers were capable of having been used as described in Holocaust literature.

During the next several years, my articles on German gas chambers always referred to the American gas chambers. These articles included "The Rumor of Auschwitz or the Gas Chamber Problem," published on December 29, 1978, in a French daily newspaper, *Le Monde*,¹⁷ and a long interview published in August 1979 in the Italian periodical *Storia Illustrata*.¹⁸ I visited the gas chamber in Baltimore, Maryland, in September 1979 and obtained eight photographs of the chamber and additional documentation. Then, during a meeting held in New York City under the chairmanship of Fritz Berg, I showed the Gas Chamber Procedure Check Sheet of the Baltimore penitentiary and discussed its implications. In 1980, in the first issue of the newly created *Journal of Historical Review*, I published an article entitled "The Mechanics of Gassing,"¹⁹ in which I described in some detail the gas-chamber procedures used in the United States. In the same year, I published in *Vérité Historique ou Vérité Politique?* the eight photographs of the Baltimore gas

chamber.²⁰ My video entitled “The Gas Chamber Problem,” made in 1982, began with an analysis of the American gas chambers.

In 1983, I prepared for the Institute for Historical Review, Los Angeles, a book written in English on the Holocaust controversy which was to include, for the first time, a list of the questions put to the penitentiary wardens and their answers. The book, however, was never published: on July 4, 1984, American Independence Day, the archives of the Institute were destroyed by arson. This fire, for all intents and purposes, destroyed the financial viability of the Institute, and a number of projects, including that of my book, were abandoned.²¹

The Holocaust has appeared to be a subject of enormous proportions. But this “giant,” as Dr. Arthur Butz pointed out in *The Hoax of the Twentieth Century*,²² is a giant with feet of clay. To see the feet of clay, one need only go to Auschwitz Concentration Camp in Poland. In the words of Dr. Wilhelm Stäglich, “the extermination thesis stands or falls with the allegation that Auschwitz was a ‘death factory’.”²³ And for me, the whole mystery of Auschwitz is, in turn, concentrated on the 65 square meters of the alleged gas chamber of Auschwitz I and on the 210 square meters of the alleged gas chamber of Birkenau. These 275 square meters should have been forensically examined immediately after the war by the Allies, but no such examination was ever carried out then or since. The Polish examining magistrate, Jan Sehn, ordered some forensic examinations at Auschwitz but not of the alleged execution gas chambers themselves.

Research by revisionists has shown that the places alleged to have been execution gas chambers could not have been used for such a purpose. Ditlieb Felderer published photographs indicating the flimsy construction of vents and doors to the gas chambers and the lack of Prussian-blue stains on the walls.²⁴ I myself had discovered in 1975 in the archives of the Auschwitz State Museum (archives which are well-guarded by Communist officials) the plans of these alleged gas chambers and was the first to publish them in various books and articles. These plans were also shown at the first convention of the Institute for Historical Review in Los Angeles in 1979, when Mr. Zündel was present. In reality, these alleged gas chambers had been mortuaries or, as indicated on

the plans, “*Leichenhalle*” for Krema I (later transformed into an air-raid shelter) and “*Leichenkeller*” for Krema II.

Nevertheless, in order to obtain an entirely scientific confirmation of what simple common sense compelled us to see and what revisionist research work and documents had revealed, it was necessary to look for an American gas-chamber specialist. I desperately tried to find such a specialist, but, frankly, I had little hope of finding a man who was not only an expert in gas-chamber technology, but also courageous enough to carry out such an investigation in a Communist country and to publish the results if ever they confirmed revisionist conclusions. Fortunately, I was wrong.

Fred Leuchter was this specialist. He went to Poland, conducted the forensic examination, wrote his report and testified in a Canadian court on behalf of Mr. Zündel. In so doing, he has quietly entered history.

Fred Leuchter is a modest but quietly determined man who speaks precisely. He would be an excellent professor and has the gift of making people understand the intricacies of any difficult problem. When I asked him whether or not he was afraid of any dangerous consequences, he replied, “A fact is a fact.” Upon reading the *Leuchter Report*, David Irving, the famous British historian, said on April 22, 1988, during his testimony in Toronto that it was a “shattering” document which would become essential for any future historian writing on the Second World War.

Without Ernst Zündel, almost nothing of what has now transpired would have been conceivable. He sacrifices everything in his search for historical accuracy and lives under difficult conditions, facing influential and powerful enemies. The pressure on him is permanent and takes the most unexpected and sometimes the most vicious forms. But he has a strong personality and charisma. He knows how to analyze any given situation, to evaluate the ratio of forces, to turn adversity into advantage. From all parts of the world he attracts and mobilizes competent people. He is a profound man, a genius who combines common sense with a keen understanding of people and situations.

He may once again go to prison for his research and beliefs or be threatened with deportation. All this is possible. Anything may happen when there is an intellectual crisis and a realignment of historical concepts of such dimension. Revisionism is the great intellectual adventure at the end of this century. Whatever happens, Ernst Zündel is already the victor. He is the pacifist-activist who has achieved this victory through the powers of reason and persuasion.

On May 11, 1988, the jury found Ernst Zündel guilty of knowingly spreading false news about the Holocaust. He was sentenced to nine months’ imprisonment and was granted bail after signing a gag order, promising not to write

or speak about the “Holocaust” until the end of his appeal proceedings. He thus joined Galileo.

On August 27, 1992, the Canadian Supreme Court overturned Ernst Zündel’s conviction and declared the law unconstitutional under which he was dragged through the courts of Canada for nine years. Canada has refused to apologize to Ernst Zündel for his ordeal, and has turned down his request for compensation for his legal costs etc.

In spring of 1995, Zündel’s home in Toronto was the target of violent demonstrations. Posters spread throughout Toronto urged violence against him. On April 4, 1995, an anonymous bomb threat with a razor blade and a mousetrap was sent to Zündel. On May 7, 1995, Zündel’s

house was the victim of arson, suffering some \$400,000 of damage. During the week of May 20, 1995, Zündel received a “book parcel” containing a bomb. The police bomb squad detonated the bomb safely by remote control in a quarry near Toronto.

On August 5, 1995, the Canadian Minister of Citizenship and Immigration informed Zündel that he had been classified a “security risk” to Canada, a decision upheld by the Canadian Supreme Court on April 30, 1998.

In 1996 Zündel was dragged in front of the recently established Canadian Human Rights Commission for allegedly inciting hatred. Any evidence introduced for his defense was declared to be irrelevant by the Commission, because when it comes to incitement to hatred, “truth is not a defense,” so the decision of the Human Rights Commission. On May 25, 1998, this Commission issued a ruling finding him guilty of inciting hatred with the website dedicated to him called www.zundelsite.com. Zündel was ordered to shut down his website and cease and desist from all public statements on the Holocaust.

All subsequent attempts to challenge the legality of the proceedings of the Human Rights Commission failed, despite harsh criticism even from the mass media.

In early 2000, Ernst Zündel married the U.S. citizen Ingrid Rimland and immigrated to the United States. Due to his marriage to a U.S. citizen, he applied for permanent legal residence. The proceedings for legal residence were

Fig. 2: The Zündel residence in Toronto after the arson attack on May 7, 1995.

started properly, but some communication problems apparently evolved between Zündel and his immigration lawyer. As a result of this, Ernst Zündel missed a scheduled hearing at the U.S. Immigration and Naturalization Service in spring 2001. Hence, on February 5, 2003, Ernst Zündel was arrested, and on February 17, the U.S. authorities deported him back to Canada, where he was held in solitary confinement in a high-security prison. With the help of the new anti-terror

Fig. 3: The arrested Ernst Zündel at his arrival in Toronto, Feb. 19, 2003.

legislation enacted after 9/11, the Canadian authorities claimed that Zündel was a security risk to Canada and that the evidence proving this was a matter of national security and could therefore not be disclosed. All attempts to challenge this secret evidence and to challenge these kangaroo-style proceedings failed. On March 1, 2005, Zündel was deported to Germany. The Canadian authorities gave as reasons that Zündel was a security risk because he had associated with individuals and groups that were allegedly inclined to endorse or engage in violence and because his views destabilize the government of Germany.

As these lines are being written, Ernst Zündel is sitting in a German jail in Mannheim awaiting his trial for “Holocaust denial,” an offense which is punished with up to five years imprisonment. In Germany, no exonerating evidence may be introduced in such trials, since that same evidence would constitute “denial” as well and would merely lead to another criminal indictment of the defendant *and* his lawyer.

Robert Faurisson, Toronto, April 23, 1988

Updated on May 3, 2005

P.S.: On February 15, 2007, Ernst Zündel was sentenced to five years’ imprisonment by judge Meinerzhagen of the Mannheim District Court. The two years he had spent in Canada in solitary confinement were not recognized by the German court, claiming that this confinement had been unrelated.

On March 1, 2010, Ernst Zündel was finally released from prison. When he was deported from the U.S. in 2005, he was barred from returning to the U.S. for 20 years. Since the German government has issued a European arrest warrant for his wife Ingrid for her revisionist activities, she cannot come to Europe either, hence for this couple a married life together takes place only during brief vacation time spent in third countries outside of Europe.

2. A Brief History of Critiques of the Leuchter Report

A fact-oriented discussion of the technical arguments brought to the public by the *Leuchter Report* was started in France by an attempt at refutation by the French pharmacist Jean-Claude Pressac in the periodical *Jour Juif*.²⁵ However, Pressac's article could hardly qualify as an expert discussion, because he did not back up any of his technical or scientific claims with evidence or exact scientific argumentation. Though he did point out several deficiencies in the *Leuchter Report*, he made several errors himself in chemical and engineering questions due to his lack of expertise.²⁶

Next came the late Dr. Georges Wellers, who has been both Professor for Physiology and Biochemistry at France's National Center for Scientific Research (Centre National de la Recherche Scientifique, CNRS) and president of the historical commission of the Center for Contemporary Jewish Documentation (*Centre de Documentation Juive Contemporaine, CDJC*) in Paris. He wrote an article narrowly focusing on only a few aspects of the *Leuchter Report*:²⁷ His paper is characterized by wishful thinking running contrary to physical reality and ignoring what witnesses claimed about the alleged homicidal gassings.²⁸

The first response from Germany came from Germany's official Institute for Contemporary History (*Institut für Zeitgeschichte*).²⁹ It was based on Pressac's work, did not bother to back up any of its claims with evidence, and was therefore hardly useful, also due to the all-too-apparent lack of technical expertise of its author, historian Hellmuth Auerbach.³⁰
